HARPER'S
NEW MONTHLY MAGAZINE.

No. CCCXLIII.—DECEMBER, 1878.—Vol. LVIII.

HYMN ON THE NATIVITY.

I sing the birth was born to-night,
The Author both of life and light:
The angels so did sound it;
And like the ravish'd shepherds said,
Who saw the light, and were afraid,
Yet search'd, and true they found it.

The Son of God, the Eternal King,
That did us all salvation bring,
And freed the soul from danger;
He whom the whole world could not take,
The Word, which heaven and earth did make,
Was now laid in a manger.

The Father's wisdom will'd it so,
The Son's obedience knew no No,
Both wills were one in stature;

Entered according to Act of Congress, in the year 1878, by Harper and Brothers, in the Office of the Librarian of Congress, at Washington.

And as that wisdom had decreed,
The Word was now made Flesh indeed,
And took on Him our nature.

What comfort by Him do we win,
Who made Himself the price of sin
To make us heirs of glory!
To see this Babe, all innocence,
A martyr born in our defense:
Can man forget this story?

CHRISTMAS-DAY.

As on the night before this blessèd morn
A troop of angels unto shepherds told,
Where, in a stable, He was poorly born
Whom nor the earth nor heav'n of heav'ns can hold;
Through Bethlem rung
This news of their return;
Yea, angels sung
That God with us was born;
And they made mirth because we should not mourn.

His love, therefore, O let us all confess,
And to the sons of men His work express!

This favor Christ vouchsafèd for our sake—
To buy us thrones, He in a manger lay;
Our weakness took, that we His strength might take
And was disrob'd that He might us array.
Our flesh He wore,
Our sins to wear away;
Our curse He bore,
That we escape it may,
And wept for us, that we might sing for aye.

His love, therefore, O let us all confess,
And to the sons of men His work express!

A CHRISTMAS CAROL.

The shepherds went their hasty way,
And found the lowly stable-shed
Where the Virgin-Mother lay:
And now they checked their eager tread,
For to the Babe, that at her bosom clung,
A mother's song the Virgin-Mother sung.

They told her how a glorious light,
Streaming from a heavenly throng,
Around them shone, suspending night,
While sweeter than a mother's song
Blest angels heralded the Saviour's birth,
Glory to God on high! and Peace on Earth.

She listened to the tale divine,
And closer still the Babe she prest;

"THE SHEPHERDS WENT THEIR HASTY WAY."

And while she cried, The Babe is mine!
The milk rushed faster to her breast;
Joy rose within her like a summer's morn:
Peace, peace on earth! the Prince of Peace is born.

Thou Mother of the Prince of Peace,
Poor, simple, and of low estate!
That strife should vanish, battle cease,
O why should this thy soul elate?

Sweet music's loudest note, the poet's story—
Didst thou ne'er love to hear of fame and glory?

And is not war a youthful king,
A stately hero clad in mail?
Beneath his footsteps laurels spring;
Him earth's majestic monarchs hail
Their friend, their playmate; and his bold bright eye
Compels the maiden's love-confessing sigh.

"Tell this in some more courtly scene,
To maids and youths in robes of state!
I am a woman poor and mean,
And therefore is my soul elate.
War is a ruffian, all with guilt defiled,
That from the aged father tears his child.

"A murderous fiend, by fiends adored,
He kills the sire and starves the son;
The husband kills, and from her board
Steals all his widow's toil had won;
Plunders God's world of beauty; rends away
All safety from the night, all comfort from the day.

"Then wisely is my soul elate
That strife should vanish, battle cease;
I'm poor and of a low estate,
The mother of the Prince of Peace.
Joy rises in me like a summer's morn:
Peace, peace on earth! the Prince of Peace is born."

MERCY'S APPEAL TO GOD FOR MAN.

Who can forget—never to be forgot—
The time that all the world in slumber lies,
When, like the stars, the singing angels shot
To earth, and Heav'n awakèd all his eyes
To see another sun at midnight rise
On earth? Was never sight of pareil fame;
For God before, man like Himself did frame,
But God Himself now like a mortal man became.

A Child He was, and had not learnt to speak,
That with His word the world before did make;
His mother's arms Him bore, He was so weak,
That with one hand the vaults of heav'n could shake;
See how small room my infant Lord doth take,
Whom all the world is not enough to hold!
Who of His years or of His age hath told?
Never such age so young, never a child so old.

And yet but newly He was infanted,
And yet already He was sought to die;
Yet scarcely born, already banishèd;
Not able yet to go, and forc't to fly;
But scarcely fled away, when, by-and-by

"AND FOUND THE LOWLY STABLE-SHED."

The tyrant's sword with blood is all defiled,
And Rachel, for her sons, with fury wild,
Cries, "O thou cruel king!" and "O my sweetest child!"

Egypt His nurse became, where Nilus springs,
Who, straight to entertain the rising sun,
The hasty harvest in his bosom brings;
But now for drieth the fields were all undone,
And now with waters all is overrun:

So fast the Cynthian mountains pour'd their snow,
When once they felt the sun so near them glow,
That Nilus Egypt lost, and to a sea did grow.

The angels caroll'd loud their song of peace;
The cursèd oracles were strucken dumb;
To see their Shepherd the poor shepherds press;
To see their King the kingly Sophies come;
And them to guide unto his Master's home
A star comes dancing up the Orient,
That springs for joy over the strawy tent,
Where gold, to make their Prince a crown, they all present.

Young John, glad child! before he could be born,
Leapt in the womb, his joy to prophesy;
Old Anna, though with age all spent and worn,
Proclaims her Saviour to posterity;
And Simeon fast his dying notes doth ply.
Oh, how the blessèd souls about Him trace!
It is the Sire of Heav'n thou dost embrace:
Sing, Simeon, sing—sing, Simeon, sing apace!

TWO HUNDRED AND TWO.

THE town of Telephone is ten miles from Boston. It is comfortably situated on the Breakwater Branch of the Happiness and Energy Railroad, whose trains leave the Boston and Mexico Dépôt at all inconvenient hours of the day and evening, reaching Telephone when they feel like it, and departing at the same time, the half or even the whole of a minute in advance of their time-tables being looked upon, perhaps, by the corporation as a delicate atonement for avoidable delays in arrival, and as tending in the long-run to exhibit the law of compensation and the equality of things.

No one was ever heard, however, to criticise the railway communication of Telephone with the outer world except the house-hunters; and as this long-suffering class of society formed the larger part of the passengers, naturally little attention was paid to their preferences.

So at least a man was thinking, somewhat sulkily, one bitter day last November, as—having lost his dinner, gained a sore throat, and paid Telephone's most aspiring price for carriage hire to prospect the town in forty-five minutes, and find a home for a lifetime before the two o'clock train went—he found himself gaping at the empty track, whose conscious rails trembled yet with the thrill of departed force. He had not only lost his train; he had failed to find his house. Any under-graduate in human experience will comprehend how heavily the annoyance of the one circumstance was heightened by the existence of the other.

"Didn't lose the train, did you now?" The station-mistress said this. She spoke in a tone of cautious sympathy, not unlike that with which we approach the threshold where we are uncertain whether death has recently preceded us.

She came out from her little "parlor" into the deserted waiting-room. Beyond the swinging and uncertain door one could perceive the colors of a very modern carpet, a paper dado, German ivies, an air-tight stove, decorated blacking bottles, a child framing chromos in colored straws, a girl in a pull-back and imitation lace frill thrumming polkas at a piano with its legs in calico pantaloons, rag mats, a cat, and the odors of beefsteak and doughnuts. As the woman stood in the doorway a baby crawled after her, pushing aside her flounced alpaca skirts, and from beneath them regarded the passenger with the marble calm peculiar to a child of the railway, to whom men, machinery, and other sources of disturbance are as unimportant as a daily lullaby.

The mother's ankle, which the child first generously revealed, and then obligingly called attention to by clasping it with one hand and pounding it with the other in a particularly absent-minded way—the mother's ankle was incased in a shapely Balbriggan stocking of striped red and white, which lost itself in the outline of a well-fitting "Newport tie."

"Beg pardon, madam?" said the passenger. He was wondering if he had sworn a little about the train. He did not know that there were women about. What a consummately American scene it was in there behind that self-conscious, superior, jealous door! Comfortable enough, too.

"DIDN'T LOSE THE TRAIN, DID YOU NOW?"

They had a right to feel superior, these people with houses. He would have accepted five rooms in a railway station himself then not ungratefully. It might well be jealous, the door that creaked guard upon the blacking bottles and the kitten and the baby.

He felt to the full at that moment the indefinable eternal aristocracy of home, wondering if he had ever felt it before. She might put her piano in calico trousers to the end of her days, this high-cheeked woman; but she did not invite strange gentlemen into the room where her little daughter sat practicing in the pull-back and the frill.

"I'm sorry you lost it," pursued the station-mistress, with some vain effort to disunite the baby and the Balbriggan stocking; "and your dinner too, I'll dare say? Next one goes at quarter to five. Hope you'll set down and make yerself as comfortable as you can. I'll turn on the draught a mite; it's growing cold. There! There's a lady I've got to speak to. She left a bundle of salary here. They 'most always leave something—pocket-books and parasols and arctics; we have one man always leave sassingers. They come from Boston dead beat out, and so they drop things—butter, and silk dresses, and no end of neck-ties and that. I'll wait till she gits along. It seemed a pity to have her salary spile. She can't afford salary none too often."

"It *is* cold, as you say," suggested the passenger, idly, "and the mud is not yet frozen stiff. Allow me; I will hand the package to the lady. Oblige me by staying in-doors with the baby—as you should," he added, with unconscious autocracy. It seemed to him unnatural that a woman with a baby should go out of doors. It usually did, he thought, but he had never, perhaps, recognized this essentially masculine train of logic in himself before. She should sit down, in the clean red and white striped stockings, under the German ivies, and watch those patient frames go fitting themselves under impatient little fingers, colored straw to colored straw.

It was not until he got out into the keen

air that he remembered how much beefsteak and doughnuts this picturesque course of action involved breathing.

This lady now who had lost her "salary." As he explained his errand in a word, standing before her with lifted hat, he caught himself wondering incoherently whether she liked it, facing the full east wind. She stood with her face to the marshes, beyond whose pale gray tides the other tides of the sea could be neither seen nor heard. Yet the air was salt with them; he could taste them with his dinnerless lips. But the lady was protected with a veil of heavily figured old-fashioned lace; perhaps she did not taste the salt. At all events, she had her celery, probably her dinner too, and a house.

MISS VESTA ROLLINSTALL.

The passenger put on his hat again, and dreamily returned to the station. As the celery lady walked on, with rather a bounding step for a woman who could have been no longer in her first youth (he should judge by the gravity of her dress and the repose of her carriage), he bluntly wished he had some more women to think about before five o'clock. Probably the station-mistress had shut her Balbriggan stockings away with the piano legs by this time. He had a great mind to knock, and ask her to let the cat come out and stay with him. Not the baby. He wouldn't ask for the baby. It would probably attack the hem of his pantaloons to hunt for striped stockings—and his were a pale gray. Then it would be disappointed, and perhaps cry. Besides, he was muddy.

But the baby was already there before him; the mother held it deftly under one arm while she poked the fire in the sad cylinder stove with a cheerful muscle.

"How large is this metropolis?" asked the passenger, abruptly, coming to warm his hands before the burning heart of the coals, which acquired a preternatural homelikeness from the fact that it was the only spot of comfort or of color in the bare room; it was clean, though, that room: they always were when your station-master was a woman.

"Sir?"

"How many people are there in this town?"

"Two thousand."

"How old is it?"

"Two years."

"Two years! And all these houses?"

"There ain't a house in this town, Sir, hain't been built within two years—only one."

"And how old, pray, is that?"

"Two hundred."

"This is not a common state of things," said the passenger, after a pause.

"We wouldn't have that," pursued the station-mistress, in the regretful tone of one who is explaining away a blemish on a friend's character, "but for the b'und'ry line."

"The—what kind of line?"

"Well, yes. When they laid us out they cut the b'und'ry line acrost Palestine, and cut this lady right through; and so we hed to take her. And that's how she happens to be so old; for Palestine is full of that kind of folks, and the rest of us so young, Sir. There's three first-rate chances up that way—two sales and one rent, besides a barn—and not too near the steam-shovel."

"The steam-shovel?" echoed the passenger.

"Why, yes," said the station-mistress, closing the stove door with a snap of superior intelligence. "Don't you know? They use it for building the aqueduct, and for gravel trains, and all those things. Folks don't

always like it, because it shovels all night. Some take it to heart so, they move away. But you hev to pay higher as you get off from it. There's a good many things to consider in buying house lots in Telephone."

"So it seems," said the passenger. "I think I'll run out, if I've got three hours to wait, and look at those places opposite the house from Palestine. I surely have seen none such."

"I would if I was you," said the station-mistress. She seemed to have changed her mind about something she was going to say to the passenger, speaking with a slight reserve, as to a possible neighbor of whom one knew nothing. She gathered the baby into her neck and turned away. She shut the door upon her sacred little daughter and the pull-back and the polka.

She was at home, thought the passenger, as he turned out into the now fast-rising wind, and smacked his hungry lips again, to taste the salt from the unseen sea.

Miss Vesta Rollinstall came and looked at the clouds with a gentle sigh. Standing in the street below, one could almost have seen her sigh. She was not a sighing woman either. Her wooden house was gray, but not with paint; gray, too, was the sleeve of her cashmere dress which thrust the gray blind back, and held an ashes-of-roses curtain half drawn, as if reluctant to shut out the bleached grass in the front yard, the black trunks and branches of the few and faithful elms that the "b'und'ry line" had left her, the colorless gravel heaps in the empty corner lot, the dull outline of the aqueduct, the gray paint (mixed with kerosene) of the opposite empty house, and the grayer hue of the bending and more empty heavens. She *was* reluctant. She stood longer than usual on these pallid November nights taking her last look at the outer world, dreading to light the old lamps which had not yet yielded the field to that puffy and expensive suburban gas; slow to acknowledge that night had come; unready to admit by this mute leave-taking of her neighbors that it was time to turn the old-fashioned bolt in the uneven front-door, and to know that there would be no occasion to open it again till she peered out, shivering in her dressing-gown, at six o'clock next morning, to pull in the little pint can that the milk-man would leave at three.

She did not even keep a dog. The Rollinstalls never had.

The Rollinstalls, it is needless to say, were a very old family; none older in Palestine. Miss Vesta prided herself upon being too good an American to remember this fact—and accordingly seldom forgot it. She had acceded cheerfully to the geographical and political fate which had expatriated her into this truly representative American community with the absurd name and the absurder aspirations, feeling it to be her duty; parted even with the ancestral elms and the apple orchard, to make way for the Happiness and Energy Railroad, without an audible groan. Many of her Palestine friends had moved to town; Miss Vesta sometimes wondered why. Now and then they came out to lunch with her. Others had died; for Miss Vesta was no longer young. Some had married, which amounted to the same thing. Miss Vesta lived very much alone. As years went on she sometimes felt as if that "b'und'ry line," invisible, intangible, unassailable thing as it was, had in deed and truth cut her off from her old familiar life into this new and unnatural one, in which she felt herself as solitary among the bustling young couples who gossiped and laughed and trusted their way along, with unpaid debts and uncounted babies, as the gambrel-roofed, unpainted house itself, set wistfully down among its pert and peaked neighbors.

In pleasant weather she had a theory that she did not think about these things. But when it was stormy, as to-night, she could not deny that she hated it all—yes, all; the whole new, shiny, vulgar sight; the little square lots with the turned-up turf, in which no tree nor shrub had found a shelter, not even a make-shift of an arbor-vitæ, fresh from the nursery, and shivering to a stake, like a baby learning to walk in a baby-jumper; where the human babies played about in the mud, while their fathers painted the fences and put on silver door-plates, and their mothers wore trailing calico wrappers on week-days and velveteen suits on Sundays, and kept the blinds of the parlor shut. She hated the rows of cheap houses, all alike; she hated the signs put out, "For Sale" or "To Let;" the shabby paint peeling off; the smell of the concrete sidewalks; the barbarous steam-shovel; the gangs of laborers putting water-works into streets whose existence she had not heard of a month ago; the lines of lank men pouring every day to and from the business trains; the serenity of their uncultivated and unthoughtful faces: why, the half of them were mortgaged over the depth of soul and body for those square little showy homes of theirs!

Miss Vesta felt very lonely whenever she began to hate any thing. So now, as she stood reluctantly clinging to the ashes-of-roses curtains, casting her eyes up and down the empty streets, they slowly darkened and blurred; one quiet tear rolled and fell upon her gray dress.

"Nonsense!" said Miss Vesta, with a start. "Salt spoils cashmere!" and she went for the hartshorn bottle to rub off the spot. Miss Vesta did not often cry.

When she came back, resolutely this time,

to draw the curtain close, she saw, across the gloom of the rapidly darkening street, and through the drizzle of the rain which now fell steadily, that lights were astir in the opposite house. She stood for a minute looking over. It was Mr. Jobbs, with tenants possible, or perhaps even actual. It often happened. She was used to it—rather liked to see it. Of all these people who came out house-hunting on the afternoon trains, Jobbs would decoy one some day to sign the lease of his leaky house; the family would have the rheumatism, but she would have neighbors. Possibly — who knew?—pleasant neighbors like the dear old lady Church who had pneumonia there last year; or the young Pettiwinkler, with the very clean baby, on the corner; or even the Purchases, whom she liked so much when she helped them through with the scarlet fever; or the Adamses, who subscribed to her mission Sunday-school.

It was noticeable how perceptibly Miss Vesta's opinion of Telephone rose as she stood looking at the cheerful flicker of Mr. Jobbs's kerosene lamp from empty room to empty room across there in the dusk, and the broken outline of the shadows that the two men made, seen through the uncurtained windows as Jobbs threw back the blinds. The Jobbs shadow was short, square, and familiar. The tenant shadow was tall and strange, yet, after the moment's glance, seemed not unfamiliar either. This struck Miss Vesta pleasantly as she drew her curtain in good faith at last, shrinking suddenly back, as if she had herself been visible behind the small green panes of her old window. Perhaps it would be a gentlemanly person with a nice wife. Miss Vesta felt starved sometimes for a woman—a woman one would care to see, perhaps, twice a week. In Palestine how she and Susy Hemlock used to "run in" every day! There seemed no place to "run in" to in Telephone. And Susy was dead. And it was time to light the astral lamp and the kitchen lamp, and to put on the kettle. She must wash the celery too, which would not keep till to-morrow.

It was scarcely a Palestine custom, eating celery for supper. Miss Vesta crushed it delicately and doubtfully. She liked to do things as she was brought up to do them. She washed her solitary tea-cup and her two silver spoons and her lonely goblet daintily by themselves in the Dresden bowl upon the table, just as she used to do when she "kept help," before her Michigan Central stock went down and she had no one to tell her that it was time to sell. After she had wiped the silver and glass with delicate fingers upon a fine old red and blue fruit doyley by the light of the astral, she went into the kitchen, turned up her sleeves, turned up her dress, put on an apron, and "did" the rest of the dishes by the little brass kitchen lamp.

After this she turned down her sleeves, with darned Valenciennes at the wrist, turned down the skirt of the cashmere (which had been her "afternoon dress" for seven years), went into the silent parlor and lighted the fire in the fire-place, and sat down alone. She did not light that fire often. Open fires are expensive company. When it stormed, she sometimes allowed herself the luxury. She sat in a low cushioned rocking-chair, in the irregular light. She had a pink ribbon at her throat, over her gray dress; it was of the old-fashioned rose pink now so hard to find, not a scorch of Magenta in it, pure as a blush-bud on a June day, deepening as one looked at it. Stiff little roses were painted on it in water-colors. Susy Hemlock painted that ribbon for her one day; she had a cold—couldn't come—couldn't wait—Jared brought it over.

Miss Vesta rose and walked about the room two or three times. The Rollinstall ladies often had that trick of pacing the room—a habit which only women of independent character and circumstance are apt to have, I believe. The Rollinstalls had always felt at liberty to do as they chose. Usually, however, they chose to do largely the same things. When they married, they married clergymen or lawyers; brought up their children to have the measles under allopathic treatment, to brush their teeth three times a day, and never to go to church twice a Sunday before they were five years old. When they did not marry, they kept house; no female Rollinstall went to live with her relatives unless it were a very clear case that she was the giver, not the receiver, of benefits by so doing; they never quartered themselves on young married brothers or struggling male cousins: a Rollinstall preferred her own household, if it were in an attic. No one ever questioned the suitability of any such arrangement which members of her family might make. Miss Vesta herself was but thirty-five when her mother died, and there was a second cousin who took a flat alone at twenty-six. But *hers* died. Jane Rollinstall bore forever about her the sacred and sweet shield of maiden widowhood. Happy Jane!

Miss Vesta said "Happy Jane!" aloud, pacing bitterly to and fro. The storm had now come on heavily, and she could hear the wind beat up and down the level, lonely street. Miss Vesta's had not died. Now and then Miss Vesta remembered this. It was a luxury to think about him at all, like the open fire, only to be indulged in on stormy nights. He had not died. O that he had! O that he had! Sometimes, if it stormed *very* hard, Miss Vesta said this too aloud, crying passionately out. Some-

times she thought if this had been so, how blessed she would be. But he did not die; he only got tired of waiting. Why was it that men could not wait? Women did.

And they could not marry then. Jared himself admitted it after a while. But it was a good while before Miss Vesta stopped remembering on stormy nights how he looked the day she told him—blazing, white, taking her face between his shaking hands—her face, young then, and not uncomely: there was never a Rollinstall who was not comely. They used that sweet, decorous word when they spoke of it even in their own hearts; it seemed more reserved, Miss Vesta thought, more modest, than "pretty" or "good-looking."

Miss Vesta's thought had diverged just here, like my sentence. She did not like to keep it where it was; it took her breath.

"I never will endure it!" Jared Hemlock said. "I can not live without you. Neither heaven nor hell shall come between us. I'll have you somehow, Vesta."

Miss Vesta's pale face scorched as she sat alone there by her own fire, with no one else in all the empty house. She looked at her withering hands, the prim, pure colors of her dress. It seemed to her a kind of rudeness that any man should ever have been in the world talking so to her, it was so far off now. And then he had not had her somehow. He had lived without her. He had endured it. Nor was it heaven or hell that had come between them.

It was nothing so romantic or profane as that, thought poor Miss Vesta. It was only that her mother had the paralytic stroke, and that her father, as every body knew, grew blind. Some one must take care of them. There was nobody but Miss Vesta.

And then there was not much to live on. There were rich Rollinstalls—rich enough to have bought up the Michigan Central Railroad—but that was the Rhode Island branch. And Jared was the minister's son. Ministers, of course, were poor. Jared said he never would be a minister. He studied law. And they had waited and waited. Jared used to come to tea every Thursday night.

And then there came a time when Jared would wait no longer. He went to Germany. Jared went to Germany, to study law or something. He went partly for his health, poor fellow. He had a touch of rheumatism, or — what was it? At first they wrote to one another. But her mother lived on, and on, and on, poor mother! quite changed, and with broken mind and petulant ways. And when her father grew so helpless Miss Vesta sat down one day, in a fever of worry and weariness, and wrote to Jared that since her duty was at home, and was likely to be there till she was old and ill herself, since God had willed it so, and since they could not help it, she or he, and since he was so far away, and in strange scenes and among strange people, perhaps they had better call themselves dear friends only to each other, knowing so little as they did what the future had in store for him especially. And Jared wrote that perhaps they had, but that no one else could be so dear as she—not even in Germany; which was a great comfort to Miss Vesta for a little while. She had never been in Germany. She felt as if that mysterious country abounded in pleasant ladies with no invalid parents to take care of. And so by-and-by Jared did not write so often. And so one day she saw it in the *Puritan Recorder* that he was married, and that his wife's first name was Berta, and that she lived in Leipsic. And Jared sent cards to the family. And then he wrote no more. And he had never come home. Jane Rollinstall had a theory that he was dead. Once she had expressed it to Miss Vesta. But Miss Vesta could not talk about it. She did not answer Jane. Her father died that year. When she was thirty-five her mother followed him. The old lady complained a great deal to the neighbors of her daughter the last year of her life; said that Vesta had not got married, and was a burden to the family. Miss Vesta laid her away in the Rollinstall lot of the Palestine Cemetery, with a sickening grief which none of the occasional friends who came from Boston to lunch with her seemed to understand; even Jane Rollinstall herself said it was not like losing one's husband or lover, but invited Miss Vesta to spend a month with her.

Miss Vesta cried when nobody saw her, and then cried because there was nobody to see her; and so, for economy, gave up crying by-and-by, except on stormy nights, as I said. She had lived a hard life of devotion to a hard duty for a great while. Every nerve in her body and soul quivered tense now like a breaking thing. She could not afford to become hysterical. If she did, something would snap.

Youth dies hard, and hope harder. Miss Vesta could not understand at first, when at thirty-five she was left alone in the unpainted house, where two hundred years of human joy and anguish kept her mute company, that doing one's definite duty bravely and patiently to the end does not bring one definite happiness. She had really felt sometimes as if God must mean to surprise her now that the duty was done, as if He had kept some good thing waiting till she could take it.

At first she thought it must be the mission Sunday-school He meant, for to the Sunday-school she had turned devoutly and devotedly as soon as her lonely hands were free. All the Rollinstall ladies taught in

mission schools; usually stopped when they married, and gave the class to some well-connected young lady who was actively desirous for religious usefulness.

It was with as much surprise as pain that Miss Vesta discovered by-and-by that there were fierce clamors and wide wastes in her nature which even her twelve big, red, freckled boys in the vestry could not fill. They were fine fellows; and when the superintendent said that each class might give itself a name for use at the concert, he suggested that they should be called Lilies-of-the-Valley.

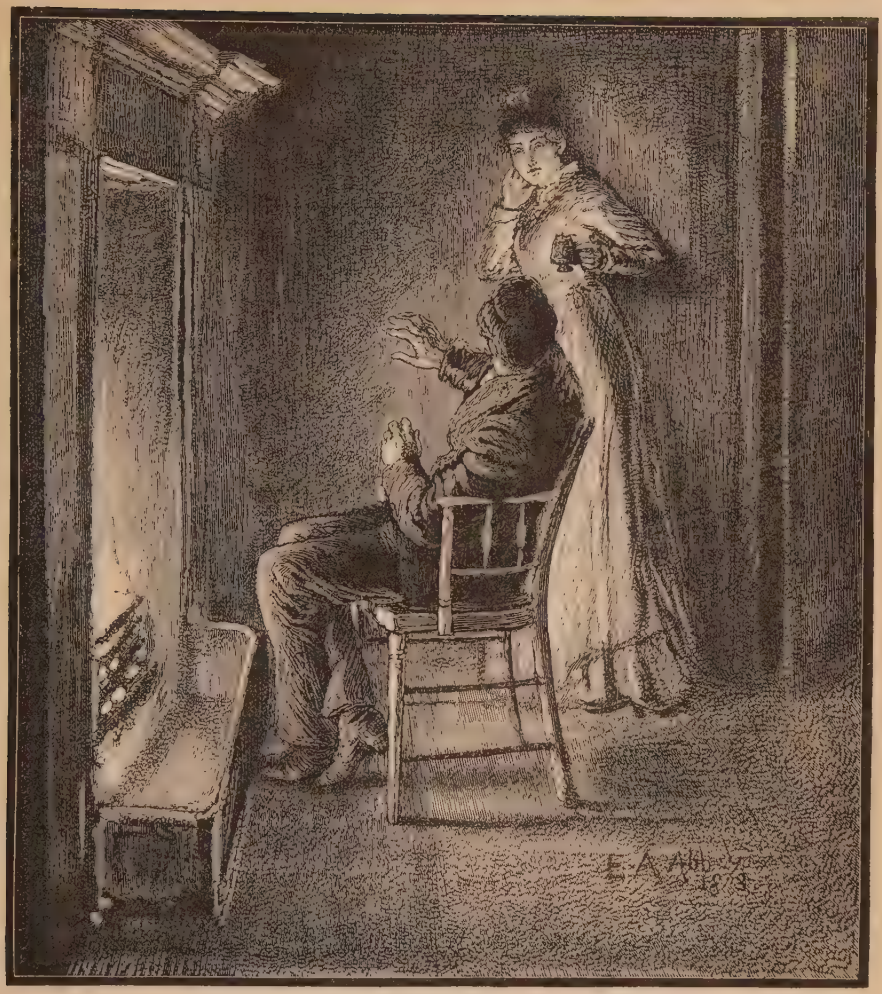
But ah! if hope dies hard, perhaps, after all, youth dies harder. Miss Vesta was still "comely," and the old people were gone. Palestine bachelors and widowers began to think of this. On week-days, between the returning excitements of the mission school, Miss Vesta's life vibrated now with strange confusions. The minister himself paid his decorous distinct addresses at the ancient house, and Miss Vesta had all the weakness of a woman of the olden time (to say nothing of the added family predilections in this direction) for ministers. At least two lawyers came, saw, and were conquered; and Jane Rollinstall herself wrote, advising her to think seriously of the shoe-and-leather merchant who did business in Boston. But Miss Vesta watched them all come and go with pure and puzzled eyes. She had loved one man. She had promised to be his wife. His hand had held her; his kiss had touched her. What did they mean, these other men? What did they expect? Could a woman do that thing again?

"How *dare* you?" she cried, to the shoe-and-leather lover, when he urged his suit a little on a moonlight evening, coming from the preparatory lecture; and then had fled from him, aghast, sobbing, like an insulted girl.

But if youth and hope die hard, the capacity for love dies harder. Here in Telephone, in this unfamiliar life, with silence for her lover, with solitude for her husband, with lonely hours for her children, Miss Vesta had been, perhaps, most sorely bested. There was a minister, too, in Telephone. He presided over the Union Church, that towered literally opposite the Telephone Bowling-Alley. Miss Vesta disapproved of Union churches on general principles; thought them not apt to be sound; her family had always thought so. But since her old Palestine pastor, Dr. Conserve, had accepted a call to Boston, there was little to do but to submit gracefully to the march of circumstances. Miss Vesta waited on the Union gentleman's preaching, and the Union gentleman waited on her.

Miss Vesta was lonely: that can not be denied. And every week she thought she grew lonelier—a little. She tried hard to like the Union minister. For a whole week she kept him waiting for his answer. She went alone into her room, and sat down in her gray dress and pink ribbon that Susy Hemlock painted, and folded her hands, and said, "Let me see if I can not love this good man." But when the week was over, she went to him and gravely said,

"When I was young I promised to be some one's wife. I can not do that twice. A woman can not—"



"But other women are not so fastidious," interrupted the minister, with a flash of temper. He had never had a woman refuse him before.

"Then I am not like other women," said Miss Vesta, simply.

So now she sat alone in the November storm, in the solitary house, thinking about these things. Her thoughts were sad enough, as those of the solitary may be—must be, we sometimes say; but they were not disquiet or perplexed. Miss Vesta was not a great, or wise, or exceptional woman; she had lived a plain and commonplace life; no heroic chance had opened before her; usefulness and honor had spoken to her in lowly language; her story had been all prose.

But one poem Miss Vesta knew by heart—the long, sweet, sane poem of a pure and permanent love. She was a delicate and tender woman; she had felt as if her delicacy and tenderness both demanded of her that she should be true to the best and highest side of her nature, so far, at least, as she understood it: Miss Vesta was an old-fashioned woman, and did not think much about "nature." All she knew was that God had given her one right love for one right man, and that solitude was a small cross to count against the wearing of such a crown. It was the only ideal she had; of reforms, causes, missions, and careers she knew little. She did not care much even about "Boston culture," and sat puzzled when the ladies talked about it at lunch. It was different somehow from what she was taught at the Palestine Female Seminary. Her unreasoning and unswerving love, I say, was the only ideal she had. She cherished it in purity and peace; she served it in honor and fidelity. Nobody called her a great woman. But that does not matter. God understood.

Miss Vesta went to bed early that stormy night; put away Susy's painted ribbon in a little olive-wood box where she kept a few other precious, useless things (her thin old betrothal ring among them); folded her gray cashmere skirt carefully; screwed out the lonely astral; knelt and said her prayers; asked the Lord, as usual, to bless Jared Hemlock, without the least doubt in the world as to whether that awful and infinite Will could be shaken by a thing so

"IN THE LIGHT OF THE LAMP AND FIRE HE TURNED HIS FACE."—[SEE PAGE 14.]

slight as the request of a solitary old maid shivering in her night dress on her knees, asking the same thing in the same way every night for fifteen years. Theology was not Miss Vesta's specialty. It was one's duty to say one's prayers. And see, when they are said, and the light of the economical street gas, which Telephone will put out at half past eleven, falls in through the parted ashes-of-roses curtain upon the smooth white bed-spread, and the increasing rain drives against the small-paned window and the sunken piazza roof, how peacefully one falls asleep!

It was twenty minutes past five o'clock—an angry storm. Miss Vesta waked, ten minutes before her usual time, wondering why, above the raging of the wind and wet, the milk-man stood making such a racket at the door below. She got herself hurriedly into her wrapper; then, filled with a dim consciousness of the unusual, anticipating possible parleys with unknown tradesmen on unguessed themes, modestly slipped instead into the gray cashmere, and, throwing an old lace handkerchief round her collarless neck, went shivering down and confidingly drew the bolt without question or demur. She peered out into the breaking darkness through the curtain of the rain.

"Jerry, is that you?"

"Madam?—excuse me."

It was not Jerry. Miss Vesta pushed the door a trifle closer, but stood serene, looking through the crack. A man was out there, dripping; dazed, it seemed.

"I thought it was the milk-man," she said, placidly.

"Would you be good enough to call your husband?" gasped the visitor. "I—I did

not mean to disturb a lady at this untimely hour; but the fact is, I'm suffering."

"Step in, then, out of the rain," said Miss Vesta, decidedly. Miss Vesta was not "timid." And this was no tramp. Besides, why tell strange men that she had no husband? It was far easier to let this person come into the front entry.

He stepped in. Miss Vesta had left one of her brass kitchen lamps burning on the stairway landing. The feeble glimmer struggled half-way down, fainted, and fell into the mysterious half light in which her visitor stood facing her. He had taken off his hat.

"I bought that confounded house opposite yesterday," began the man at once—"your pardon, madam: I mean that very unpleasant house. I took the whim to stay in it; sent in town for my things. Don't think me crazy. I've nobody but myself to think of. As well there as in hotels. That Jobbs built up a furnace fire. There was a sofa and an empty pillow-case left by the last tenants—decoys, I suppose. Madam, that house leaked like an umbrella turned wrong side out; spattered into my face; trickled up my sleeve; tickled my feet; crawled down my neck; ran in streams down the register; put out the furnace fire—almost did as much for me. I am subject to rheumatism at the heart. I stood it till I thought somebody would be stirring. I—I'll not come in to annoy a lady unless there are gentlemen here; but—excuse me, madam; I am in great pain."

He staggered slightly, leaning against the half-shut door through which the pursuing storm beat in.

"Come!" said Miss Vesta. She shut the front-door, and herself led the way into the dim and silent sitting-room, where the embers of last night's fire peered winking sleepily through the ashes.

The intruder followed her without speaking, groaning now and then.

Miss Vesta started the fire promptly, and went out to get the little lamp from the landing. She did not look at her visitor as she went. He might murder her if he chose. She would not turn a man with rheumatism at the heart out into the storm. The conventional propriety of her hospitality it never occurred to Miss Vesta's mind to question, or to question if any body else would question it. The Rollinstalls were ladies. They never did what was not proper. Every body knew that. If Miss Vesta chose to turn her house into a hospital for tramps at six o'clock in the morning, her so doing would in itself be the only explanation that the eccentricity would require.

While Miss Vesta was gone for the brass lamp the fire began to burn.

She came in, looking very pale and sweet and assured in her colorless dress, carrying the lamp with one thin hand curved to shelter the tiny flame. It was a delicate and faithful motion—like Miss Vesta.

Crouched over the waxing fire, haggard, with one hand on his heart, she found her man. She went directly up, and began with the business-like sympathy of voice that she reserved for watching and funerals and all the old-time neighborly services to the suffering.

"Now what is the first thing to be done for you? Let me see your pulse. No, your face first."

In the light of the lamp and fire he turned his face, and they looked at one another.

"You are the man—you are the gentleman who handed me the celery," said Miss Vesta, after a pause. Then she began to tremble. Then she flung away his hand, which she had lifted with cold far fingers to feel the pulse. She retreated from him suspiciously.

"I don't know who you are!" she shrilly cried.

"Forgive me, Vesta!" he said, stretching out his shaking arm. "Before God I did not know! Every thing is so changed—"

"But where is Mrs. Hemlock?" asked Miss Vesta. We must forgive her. Rheumatism at the heart is a passing pain, soon over. That other pain of Miss Vesta's had lasted fifteen years. And Jared was warm now and comfortable; had tasted of the coffee she had cooked; Miss Vesta ate and drank nothing. She took care of him, with compressed and colorless lips, dutifully, as of an old neighbor; the tramp would have been treated as conscientiously, more tenderly. She had asked no questions. His eye had followed her. They had both been silent and constrained. Now that he was out of suffering, Miss Vesta began to wonder what Jane Rollinstall would say. So she asked:

"Where is Mrs. Hemlock? Where is your wife?"—primly, with the sharpest twang Jared had ever heard in her voice. Miss Vesta had a soft voice.

"I have no wife," he said, not more gently.

"When did she die?"

"I don't know," said Jared, meekly, with a dash of his old sauciness.

"Don't *know*?" exclaimed Miss Vesta, with great propriety of manner.

"I never had any," pursued Jared. He began to whistle; then said, "Excuse me, Vesta."

"You are perfectly excusable," said Miss Vesta, still with much Rollinstall dignity. "But we had the cards. I do not understand you, Jared Hemlock. I do not understand any thing—any thing in this world." She broke down with an unexpected little womanish wail.

"Berta jilted me," said Jared, shortly. "Perhaps you can understand that. She found a German baron she liked better. She jilted me at the very last moment. I deserved it."

"Oh!" said Miss Vesta. She did not say he did not.

"And I'm glad of it," added Jared.

"Oh!" said Miss Vesta again. She did not say she was sorry.

"But, of course," observed Jared, stirring his coffee, with a touch of embarrassment, "I thought *you* were married long ago. I was ashamed to come back to you, Vesta. To think how I did come in the end—a beggar—a tramp—drowned—a rat—a dying rat!" continued Jared, with twinkling eyes. "And to think of your saying, 'Is that you, Jerry?'" He laughed. Despite herself—the sensitive, suspicious, woman's self that was stung and bewildered in every nerve—Miss Vesta laughed too.

"It *was* funny," said Miss Vesta.

"Very well, then," said Jared; "suppose you eat your breakfast."

"There is the celery," said Miss Vesta.

She brought the celery, and Jared ate some of it. She looked on. Jared said it was frozen, and she said she did not wonder; and then neither of them said any thing.

The clear day drew on; the wind was shifting; through the curtain of the rain a soft gray light began to stir.

Jared sat by the fire, and Miss Vesta put away the breakfast-things. The wind went down. Scant drops trickled and twinkled from the piazza roof. People went by to the business train; they left their umbrellas, and nodded at each other merrily. The gray light sweetened; a warm color lay upon the gravel heaps in the corner lot. By-and-by there came the sun-burst.

Miss Vesta was standing by the window, and it broke full against her face—the shrinking, womanly face, pale and pinched and perplexed. Jared Hemlock wondered what it was like to be a woman; to be treated as he had treated her; to stand there waiting, not able to say what she thought, or felt, or wanted; wounded, wrung, and dumb, yet so tender! And true—so true!

He went abruptly over to her, and said: "Vesta, I'm not fit to touch the hem of your dress." But he put out one finger and timidly stroked the old gray cashmere sleeve. "I never felt about any body as I did—as I do—about you," said Jared Hemlock. He did not whistle now, nor laugh. Miss Vesta looked at him piercingly. She did not understand that. Perhaps it was because she was not a man. Men were so different. The Rollinstalls had always held that men were very different. "It won't do for me to stay on this way," said Jared, awkwardly. "I ought to take the next train, you know, and—clear out, and all that."

"Yes," said Miss Vesta.

"It *sounds* mean," said Jared, "but I don't *mean* to be mean. If I supposed you'd ever take me now, Vesta, after all—perhaps by-and-by, when you've got used to me—there isn't much to take, Vesta dear—an old fellow with rheumatism. It's endocarditis," added Jared, with a scientific air, "if you'd like to know."

"I'm glad you didn't marry her," said Miss Vesta, trembling. "But—" She stopped; she could not say what she was thinking. She looked at him; her delicate face shone. So the priestess might have looked, tending the white fire in that older, ruder age which cherished its own share of delicate ideals. She lifted her head with a certain haughtiness. "*I* never kissed any one—any man—but you."

She had not meant to say it, but it was said. He had not meant to do it, but it was done.

"All the more reason, Vesta, why you should do it again."

"I wonder," said Miss Vesta, presently, "what Jane Rollinstall *will* say?"

"Why, really," said Jared, in a comfortable, commonplace tone, "what with my coming in the rain and all, and the fuss it would be to explain—I hate a fuss, Vesta. Suppose we omit that stanza—suppose we go somewhere and get married? I don't see but one time's as well as another: and the sun is out."

"The Rollinstalls never have done such a thing," said Miss Vesta, hastily.

"I doubt if they ever had the opportunity," observed the lover, irreverently. He began to whistle again; but Miss Vesta, looking up, saw that his eyes were full; the hand with which he held her shook. "The amount of it is," he said, less distinctly, "I've beaten about the world so long alone, and you—you—you—my poor girl! Come, we ain't young any more, Vesta! We've tried being lonesome long enough. I don't feel as if we had a minute to lose. If I'm fit to be taken at all, I'm fit to be taken at once. Besides," added Jared, clearing his voice, "you'll *have* to take me in for charity. I can't go back to that confounded house (I paid five thousand dollars for it); I haven't any place to go. If you're going to keep me, I think it's more proper we should be married."

"I suppose it is," suggested Miss Vesta, after some thought. "We might go to Jane Rollinstall's; she would send for Dr. Conserve. I should have preferred to wait till I had thought more about it. But if you should have another of those attacks, I—should prefer to take care of you. It's no-

body's business but ours," pursued Miss Vesta, with a touch of the family dignity.

The sun came out, and came out. It seemed as if there never was so much sun *to* come out before. The fickle wind turned south, and there staid faithfully.

They went into Boston on the noon train. Half Telephone went too. Telephone always went to Boston after a storm.

Miss Vesta would not take his arm; she said, "Wait till we come home;" but she walked beside him with delicately lifted head. She drew the old-fashioned lace veil, and under her cloak she wore Susy's painted pink ribbon and the cashmere dress. She thought of putting on her silk; but it was black. She had brought down the thin engagement ring, and Jared had put it on again. She said she should have plenty of time to get some gloves in town.

The sun came out, and came out, and came out. The turned-up turf in the square lots took on warm shades of brown and scanty green. People opened the blinds of the shut parlors (on account of the moths) to let in the air. The rows of cheap houses looked fresh and clean; the gangs of laborers whistled at their work; the smell of the concrete sidewalk came up pleasantly, as if to remind one of summer, when the air would be full of it; the signs put out read cheerfully. How many happy homes there were "For Sale" or "To Let" in Telephone! All the business men Miss Vesta and Jared met had paid for their houses; their faces shone; they did not seem lank at all. Miss Vesta thought how many intelligent-looking people lived in Telephone. She told Jared she thought the place was rapidly becoming cultivated.

The ladies of the neighborhood passed them; only one had on velveteen; they were going in shopping; they wore pretty, modest clothes. The Pettiwinkle baby trundled by in its carriage, holding out its hands to Vesta. The Purchases nodded at her, smiling through the window. One of the Adamses stopped and told her that the old lady Church had sent in five dollars from Boston for the mission school. In the distance the steam-shovel sighed softly.

They looked back as they turned the concrete corner to the station. On an old gray house with little panes of glass and some elm-trees two hundred years breathed a pure and patriarchal benediction.

"Heaven bless it!" said Miss Vesta.

On a saucy, shabby cottage with a suspiciously wet roof the morning sun winked warily.

"It was only two years old, after all," said Jared, forgivingly. "Too young to know better. I'll turn it into a mission school."

The station-mistress came out to see them when they got to the station. Jared went to telegraph to Jane Rollinstall and Dr. Conserve. The station-mistress told Miss Vesta she didn't know it was an acquaintance of hers, and asked her if she was goin' in to Cousin Jane's. The station-mistress had on a clean white apron over the alpaca dress. The baby sat on the floor and held the door open—the stockings were blue that day. The sun lay distinctly on the modern carpet; it was so warm that there was no fire in the air-tight stove, and the German ivy jar stood upon it; the paper dado glittered like old mosaic varnished; the chromos were framed in the colored straw and hung over the piano. The girl in the pull-back was ornamenting the calico pantaloons with stripes of deep brick-colored worsted braid; as she sewed she sang. There was a red geranium in one of the decorated blacking bottles. The station-mistress said it was one of the days every body went to Boston. She said folks looked so happy after it had rained. Then she asked Jared if he found a house to suit him, and he said he had. Then she asked him if he minded the steam-shovel, and he said no, he didn't mind any thing; and the station-mistress said that was kind of queer. Then she asked Miss Vesta if her salary was frozen, and then she asked—

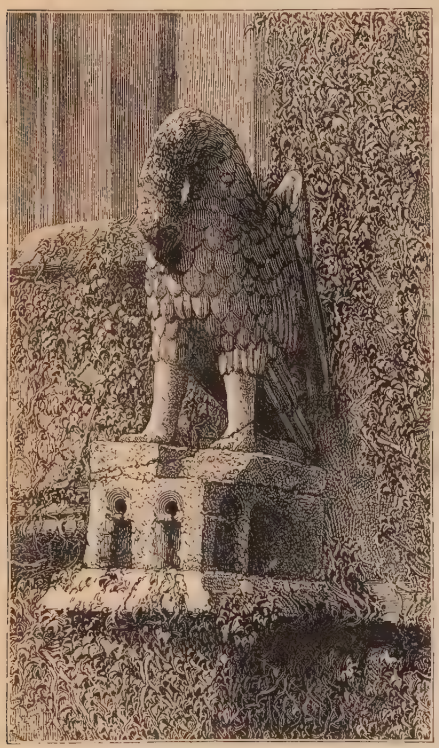
But just then the whistle sounded down the narrow, sunny length of the Happiness and Energy Railroad. The two-o'clock was prompt to an instant. Jared noticed this with approval. Every body pushed and hurried gently, laughing, to get in. Miss Vesta felt it very strange not to have to push and hurry for herself. She sat by Jared silently; she looked very smart and young behind her veil. Now and then she wondered if she had let Jared win her too easily this second time. But then she remembered those attacks. If he had not had rheumatism at the heart, of course it would have been very different. And then, as he said, they had been lonesome so long.

So when they got to Jane Rollinstall's (Jane had a flat in the Boswick Hotel) they found her at home, sitting in her black dress. She was writing invitations to a course of parlor lectures, by an unpopular but conscientious critic, on the Minor Nova Zemblan Poets. She put down her pen, and said, with much Rollinstall independence and decision:

"You did perfectly right, my dear, to come directly to me. Dr. Conserve has sent word—he boards here—that he can not come here till quarter of five. So take it easily. There are a few old Palestine friends—board here;—I thought you would like to have them present. I have invited Herman and Dorothea Rollinstall—boarding here—they belong to the Rhode Island branch."

MAGDALEN COLLEGE, OXFORD.

ENGLAND'S GREAT UNIVERSITY.



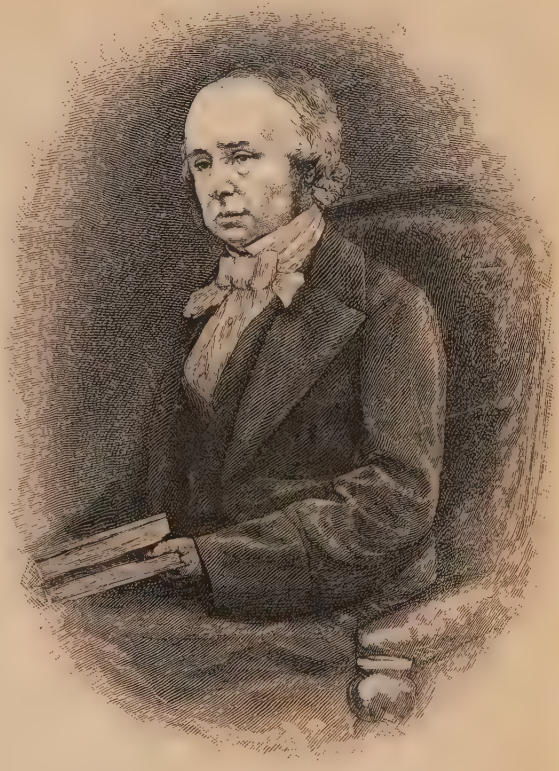
OUR modern age sometimes brings the mood when the song of Paracelsus smites the heart as the wail of the Nineteenth Century. The voyagers from afar landing on their rock in mid-sea, there build shrines for their beautiful gods, then sit together on the beach and sing because their task is done—when, lo! the raft with its gentle islanders floats near, and they tell them of their isles just at hand, with temples and olive groves all waiting for their majestic forms. Then the voyagers awoke from their dream, and realized the desolation on which their homes and ideals had been fixed; but they bade the happy islanders depart. They had no heart to mar their work, they said; their gifts once given must there abide! This is, according to Browning,

"The sad rhyme of the men who proudly clung
To their first fault, and withered in their pride."

But since the poet wrote that he has left off taking views of this fog-veiled lump of chalk called England from amid Florentine sunshine; moreover, he has made friends with Oxford and received of its honors, and I have a notion that if he had the romance to write over again now, there would be another conclusion. The voyagers having planted their little colony amid barren rock and sand, unwilling to leave the spot consecrated by their deities and their toil, worked on to improve things; slowly but steadily they pulverized the rock, and gradually saw it spring up in the stems of trees; they watered the faintly struggling weeds amid the sand, and made a soil; they sowed a little and reaped a little; they died; other generations carried forward their labors, until at last their descendants could visit the isle they missed, with its temples and olive groves, without pain or envy, and return to their own, happy and contented.

There is an outer and a mystical sense in which the fable so ending might be told of Oxford. St. Frideswide, who once took refuge from her persecutors in a pig-sty, may be supposed to have been thankful for small favors in the way of a locality; at any rate, the site fixed upon for her monastery more

than eleven centuries ago could hardly have been selected from worldly motives or a taste for the picturesque. Low, flat, meadowy, marshy, bushy, was—to a large extent still is—Oxford, with no hill to be seen. Nevertheless, it was in this unattractive place that the seekers of another country fixed their habitations and built their shrines, and it is hardly too much to say that they have turned it to a little paradise in its way. Even three hundred years ago Ralph Aggas waxed emotional about the place:



THE "COLLEGE GOVERNOR," IN MAGDALEN COLLEGE QUADRANGLE.

> "Ancient Oxford! noble nurse of skill!
> A citie seated riche in everye thing:
> Girt with wood and water."

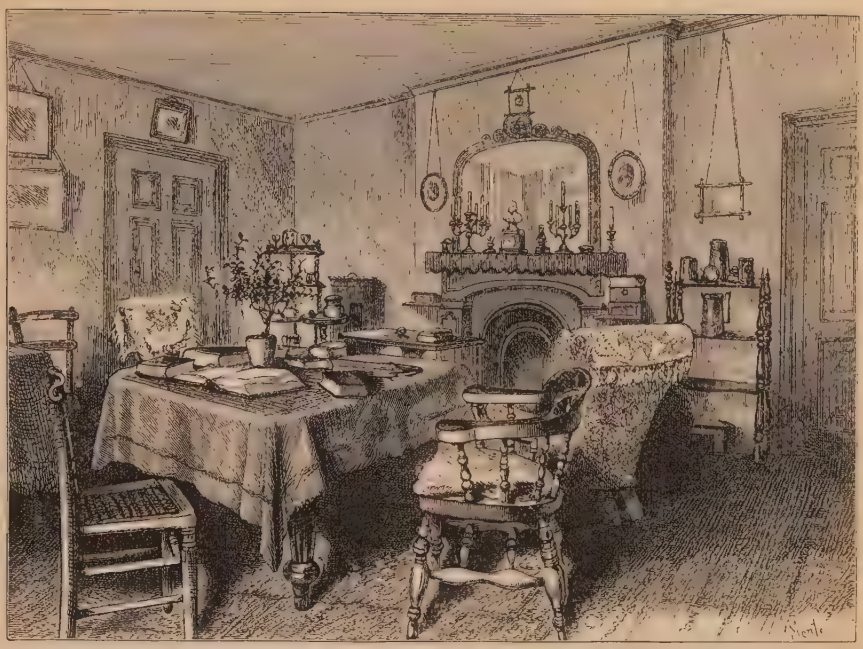
The wood is no longer visible, but about the water there can be no mistake. How, with so much meadow and various moisture around it, Oxford has managed to secure so fair a sanitary record (though this is not the very best) is a problem that may puzzle a visitor, till he discovers that the first lesson taught and mastered in the university is the art of becoming amphibious. Like the saintly baptismal duck of Attar's fable, the Oxonian leads a clean and pure life so far as water can make it so. He is an aquatic evolution. Creatures that like not water have here no habitat. There is something fluid even about Oxonian religion. Matthew Arnold must have studied out on the Isis his famous generalization about the universal "stream of tendency that makes for righteousness." That ruddy-cheeked High-Churchman you hear intoning the liturgy is the same man you saw an hour before splashing along the river-edge flannel-fleshed, bare-legged, cheering his college crew, regardless of all the pretty dames on shore waving their handkerchiefs, but presently to respond devoutly to his intonings. It were perilous to tear a black gown or a surplice in Oxford, lest some crew's colors should peep through. Thus the voyagers who settled on this marsh have for ages been turning the water into roses, such as bloom on healthy cheeks; and if the rock around them has not crumbled off into stately stems and trees, it has risen in statelier steeples and towers, which any other islanders would find it hard to match with their olive groves. These time and nature have adopted, and the eye easily follows their example; so that other natural advantages may be regarded as those least for which Oxonian law cares not—except, indeed, they be such as Shakspeare included when he personally reminded them that "nature is helped by no mean, but nature makes that mean."

There would seem to be something specially appropriate in the fact that this ancient seat of Culture should have demonstrated the power of culture by creating out of mud, marsh, and stone its perfect form and physiognomy. The harmonies to which this hundred-gated city of the modern world arose are still heard and felt. There is every where present the feeling and spirit of art and of artistic life. Masters, professors, deans, whether residing in the colleges or in separate mansions, have generally a beautiful environment; though when you look around as a scrutineer, the ornamentation is all very simple. The finest decorative touches here are such as can not be made to order, and money can not buy them. Fifteen years ago I saw in his rooms at Baliol the professor of Greek, Benjamin Jowett, who was then by *odium theologicum* compelled to do more work than any scholar in Oxford, on a stipend of £40! I then marvelled at the elegance and even beauty by which he was surrounded in a study without any thing costly; but the other day, when I had the honor of visiting the same man, now both professor of Greek and head-master of that great college, it was evident that in the finer rooms the elegance and beauty were essentially the same—the refined scholar reflected in his environment. The professors of the university, not being officers of the colleges, generally reside in detached houses, most of which appear new,

and the play of individual taste in and around them suggests a normal fullness in the professional exchequer which the catalogue of salaries does not sustain, many of these gentlemen being really underpaid. These residences, which generally have behind them a half acre of greensward perfectly trimmed, adorned with floral parterres, trees with seats beneath them, are built of deep red brick in the later Gothic style. Within is found that rare kind of order that is free from uncomfortable suggestions of geometry or mensuration. The interiors of the students' quarters often indicate familiarity with refined homes. Their rooms are considerably larger, as a rule, than the rooms of under-graduates at Harvard or Yale, and having much fewer books in them than are usual in similar rooms in America, appear like comfortable sitting-rooms rather than studies. And, finally, all these residences inside and outside the colleges have the appearance of being apartments of the city itself. That, too, is ordered like a household. The streets are nearly as clean as the college halls and quadraugles, also nearly as quiet. Not only their quaint homesteads, but their very shops, are a sympathetic constituency around the university walls and towers.

PROFESSOR BENJAMIN JOWETT, MASTER OF BALIOL COLLEGE.

If one's imagination should start out to track the architectural evolution of Oxford, every step would have its illustration. The pious pilgrims slept in groups together, and consequently the student's study is spacious. The thatched shelter under which the pilgrim-pupils shared their homely "commons" has become rich with laced architrave, coffered ceiling, and rose-window; but the young lord, the tradesman's son, and their accomplished teacher still sit there together on wooden benches, and guests are not turned empty away. Washington Irving has told the legend of the Alhambra in Spain, that it was originally a hermitage. Its pious occupant worked miracles for the king, and was asked to name his own reward. The hermit replied that his wants were simple, he merely desired to have his poor abode furnished. In the end, however, it took half the imperial treasures to "furnish" that hermitage. It has not taken less to gradually furnish the monastery which St. Frideswide founded at Oxford. It has required much more to turn the friar into a professor. Yet amid all this beauty and fine society the ancient simplicity lingers in many ways; it is easy by a few steps to pass from the nineteenth century to the thirteenth.



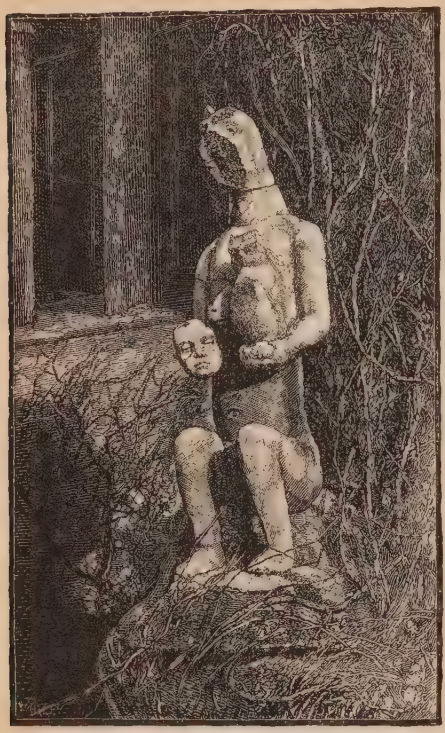
Far from "lucid" were the images which the shrine-builders of Oxford set up. An enthusiast in archæology might experience keen regrets in walking around Oxford and encountering its inscrutable—I was about to say "idols;" that is what we should call such forms if we had dug them up in India, but here we must say "symbolical figures." How one would like to "interview" the man who designed, the sculptor who executed, the statues that stand on pillars along the sides of Magdalen College quadrangle! Their date seems to be 1509, and W. Reeks—a fellow of 1671–87—tried to solve their meaning in a MS., still preserved, called "Œdipus Magdalensis." But his explanation of some of the figures when read beside them are quite as enigmatical as themselves.

The figures on the virtuous side are of comparatively easy interpretation. Beneath the two windows of the President's room are the

THE "DRAGON," IN MAGDALEN COLLEGE QUADRANGLE.

Lion and the Pelican, which clearly indicate that this high official should unite courage with that self-devoting tenderness which is fabled in the bird that feeds its young with its own blood. Then we have the stern School-master, who bears a roll of paper in one hand, and in the other a ferule. Next comes the Lawyer embracing his Client—the immediate jewel of his soul. Follows the Physician scrutinizing the contents of a bottle. The Divine is symbolized in Moses opening the tables of the Law. In unpleasant proximity to the professional group stands a Fool with his cap and bells. Samson conquering the lion; Goliath with the small stone on his forehead, much astonished; David with a short sword—succeed. Then we have a big Hippopotamus with a little one on his back, in which is discoverable the office of a Tutor to bear the undergraduate through "responsions" and "moderations." But now here come two strange forms: a plump and nude woman and a man in much the same condition, both partly animalized, and with long tails, in which our Œdipus Reeks finds symbols of sobriety and gluttony! Which means which, it seems impossible to say. Both seem to imply brazen impudence. The next is one of the queerest figures, and our old interpreter says it means Drunkenness. It is a figure of a man with three necks and heads; one of these is a humanized lion's head, another a sheep, the third (apparently) a goose. If this third were a pig's head the monstrosity might be taken to represent the rabbinical fable of drunkenness. There is a rabbinical fable to the effect that when Noah began his first work after the deluge—planting a vineyard—Satan approached and offered to be his partner in husbandry, and his offer being accepted, he (the devil) proceeded to sacrifice or slay on the vineyard successively a lion, a sheep, and a hog. Thereafter he who drank the fruit of the vine was endowed first with the lion's fierceness, next with sheepishness, and finally with the grossness of the hog. This and other rabbinical fables floated about Europe in the Middle Ages, and it is possible that the sculptor of this figure had it in his mind, but substituted a goose for the hog. But this is not the most puzzling of the figures: the next Mr. Reeks calls simply "Lycanthropy"—no doubt in despair. The head bears as much resemblance to that of a wolf as of any other animal, and that is very little; the body is male, somewhat human, and sits like a kangaroo; in one hand it holds a child's head, and beside it is an owl. The next figure is similar, but it has a frog's head; beside it is a little cow in place of an owl, and above its woman's breast is a female face—at the bottom of the neck. This probably represents the mediæval notion of the Lamia. The remaining figures are more clear: Lust is displayed in repulsive forms; there is a griffin-dragon free, and a similar one chained; and lastly we have the series completed by the mediæval Devil himself. Whatever may have been the particular significance of the various forms, there can be no doubt that as a series they were meant to impress on the youthful mind the excellence of the Virtues and horrors of the Vices. Here in Maudlen Quadrangle went on still the mighty war between Ormuzd and Ahriman, Light and Darkness, Good and Evil; and every student who passed beneath these forms had to

INTERIOR OF STUDENT'S ROOM, CHRIST-CHURCH COLLEGE.



be a soldier on one side or the other. They who here set up these figures little dreamed, perhaps, the form that struggle would assume ten centuries later, but their notion of it will probably remain after many a delusive and transient controversy has passed away, and hot theologians are succeeded by cooler and wiser teachers, who shall recognize as true comrades all who are bringing courage, love, and learning to conquer the animalism of man and chain his dragons.

I fancy it may have been after meditating on some of these monsters that young William, Duke of Gloucester, wrote in his Latin Exercise-Book (preserved in the library) certain strong similitudes for "A Tyrant." "A Tyrant is a savage hideous Beast. Imagine that you saw a certain Monster armed on all sides with 500 horns, on all sides dreadfull fatnd with humane intrails drunken with humane blood this is the fatal mischiefe whom they call A Tyrant. William. June 13th, 1700." The lad's tutor, Bishop Burnet, has made sundry corrections in the Latin, but it is to be hoped he rewarded the sentiment.

These antiquities appear ineffably curious when one sees them side by side with so many things that represent the latest improvements in physical environments. What a contrast between Lamia and the admirable Smoke-jack near by, where the fire is cooking a score of sirloins which its own smoke

"DRUNKENNESS," IN MAGDALEN QUADRANGLE.

"LYCANTHROPY," IN MAGDALEN QUADRANGLE.

turns upon their respective spits! What novelties of art, ornament, comfort, find themselves still surrounded by these funny old frames! And yet as to the Ormuzd-Ahriman battle, as to the promotion of virtue and repression of vice, it would seem that Oxford depends mainly on the ancient weapons. The statues representing the two are spiritualized, but to raise high the beautiful standard of the Good and degrade that of the Evil, is a plan not yet antiquated in the old university. Oxford is unique in the degree to which it uses the ancient Greek and Roman philosophers for moral ends. The professors study Aristotle and Plato with the students, and, instead of falling to fisticuffs over the relative merits of the two, as their predecessors did, they believe that human ferocity may be curbed by such study; therein giving a mystical interpretation to the legend of Queen's College, that its annual boar's-head feast dates from the killing of a monster boar by a student armed only with a volume of Aristotle, which he thrust down its throat. It might appear, antecedently, a hopeless undertaking to attack the animalism of Young England with volumes of Aristotle, Plato, Plutarch, Seneca, Antonine; but it is certain that the studies of these philosophers at Oxford bear far beyond their linguistic value, and this sort of culture would hardly continue to be depended on so largely were it unproductive.

In ancient times all who came to Oxford were religious people, often coming from afar and making sacrifices to obtain knowledge. Although disciplinary checks and regulations have gradually arisen, they are so few and apparently feeble that it is plain the old assumption as to the pious character of the students still largely characterizes the university. Each is treated as a seeker of knowledge and virtue. His room is as sacred from intrusion as was the monk's cell of earlier days. No master or proctor can insist on entering a student's room, whatever may be his suspicions as to proceedings inside. The extent to which this immunity is carried may be judged by the fact that every youth is allowed to order of the college stores as much wine or spirits as he desires, and his order is filled without any special limitation, and without any question being asked as to its disposal. The possibility of a young man drinking hard in his room is no more entertained than if he were still a pilgrim at the shrine of St. Frideswide. It is true that some of the colleges—and each has its own regulations—provide against "extravagance" by fixing a limit of weekly expenditure; and if the student's purchases from the college stores exceed the limit, his attention is called to it, action being taken in case of frequent repetitions of the excess. But in no case that I can discover is this limit such as could prove a restriction on drinking, wine and spirits being at co-operative prices. The student may drink French or German wines at the prices he would pay in France and Germany; a quart of brandy costs a dollar, and of whiskey eighty-four cents.

The university regulations meant to discourage dissipation and immorality are mainly directed against the seductions of the town outside college walls. The students are rigorously restrained from frequenting public-houses or saloons;* wherever they go they must wear their gowns, under penalty of fine, so that they may be recognized. As Oxford city—technically a city because it has a cathedral—exists chiefly to supply the demands of the university, the severe prohibitions of ages

* The university statutes are printed in surprising Latin, but are sufficiently explicit. *E. g.:* "Statutum est quod scholares cujuscunque conditionis a diversoriis cauponis cœnopolis ac domibus quibuscunque intra civitatem vel præcinctum universitatis in quibus vinum aut quivis alius potus aut herbe nicotiana (sive *tobacco*) ordinaria venditur abstineant; nisi ex causa necessaria et urgenti per Vice-cancellarium aut Procuratores approbanda; quodque si quis secus fecerit pro arbitrio Vice-cancellarii aut Procuratorum puniatur." Elsewhere gladiatorial combats are forbidden, along with billiards, but no offense seems so fearful as going about after sunset, or before 1 P.M., without cap and gown.

against low places of resort have had their effect in clearing the town of such. No prostitute is ever seen on the streets, and it is pretty certain that even covert immorality has been reduced to a minimum. On the other hand, the students can generally find ways of getting permission to visit other towns—it is but fourteen shillings, second-class, to London and back—and they are said to possess generally great ingenuity in cramming into a few hours the excesses which students with more opportunities spread over a week. But after all allowances are made for debaucheries elsewhere, there are good grounds for believing that the moral character of Oxford is exceptionally high, and chiefly because of the distance to which most temptations have been removed. It requires a degree of cool viciousness which happily few of these healthy youths can have, to set out deliberately upon an expedition of self-indulgence and sensuality. Impulse of the moment checked, the whole youth is checked. Solitary tippling, too, is little to the taste of the young; and their guardians quietly provide that the gathering together of under-graduates in one room shall not be pressed too far. Yet, with all this, the freedom allowed youths who have no intellectual or moral participation in the inner life of Oxford might prove perilous were it not that their animal spirits and their *ennui* find vent and relief in cricket, boating, and other sports for which such ample provision is made.

The methods of discipline and punishment at Oxford have never been quite satisfactory. The punishments consist (1) of pecuniary fines, at which wealthy students smile; (2) of rustication, or banishment from the university for a definite period, which is costly to the college; (3) expulsion. Offenses of the graver class, involving guilt cognizable by law, are dealt with by the Chancellor's Court, whose jurisdiction by virtue of ancient privilege has been acknowledged by all English courts. The Vice-Chancellor is justice of the peace for the counties of Oxford and Berks, and all cases in which a resident member of the university is concerned are first brought before him, to be dealt with summarily, or by him be remitted to the ordinary courts. But offenses against college or university regulations—such as smoking in the streets, staying out after the college gate is closed (9.15 P.M. to 10 P.M., as different colleges may prescribe), going gownless in the prescribed hours—are more difficult to deal with. The shrewd master of Baliol (Jowett) not long ago utilized an old provision, long neglected, by which a student's supplies at the Buttery might be stopped at discretion. Fancy the emotion caused in the hearty under-graduate breast and stomach when, awaiting his beef and beer and tart, he is told that his Battels (O. Eng., *bat*, to increase, and *daël*, portion) are withheld "by orders." But it only means that an interview with him is desired by the master: he only comes a little later than the rest to dinner, and has a gentle admonition to digest along with his pudding. I believe Master Jowett has saved his college and students so much trouble by this quiet, unobserved appeal to the youthful appetite that other colleges are adopting the plan. But, after all, the sovereign moral force in Oxford is the high standard of personal honor sustained from of old, as we have seen by the study of ancient philosophy, now fixed in its traditions, and felt by every member of the university in the dignity it bestows upon him. The most thoughtless youth is apt to be sobered when he finds himself generally trusted by professors to his own sense of honor, and when wherever he goes he discovers that something more is expected of an Oxonian than of other young men.

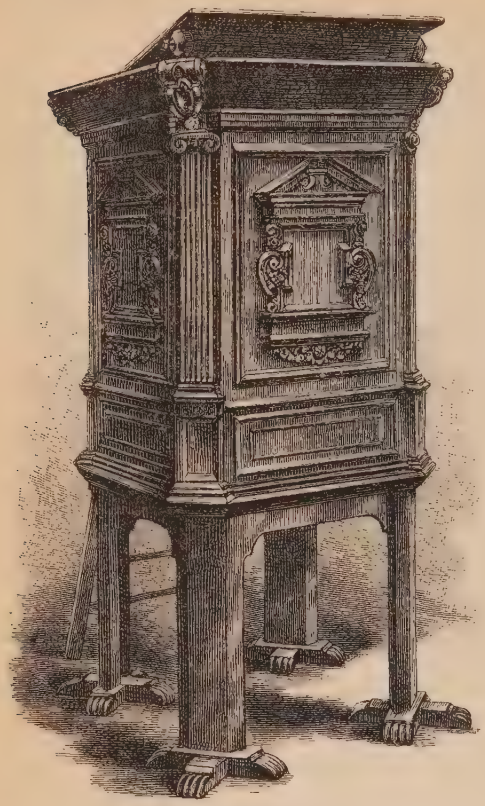
Some one has said that in England every fifty peaceful years are equal to a revolution. It may be added that such revolutions are rarely recognized by those who pass through them, and that they never go backward. But surely fifty years is a long time to allot for a revolution in this telephonic age. Perhaps it depends on the place. After reading articles about Oxford written only a quarter of a century ago, it

"THE TUTOR," IN MAGDALEN QUADRANGLE.

ENTRANCE GATE, MAGDALEN COLLEGE.

seems to me that the place must have undergone a revolution since then. About that time a very distinguished and acute American wrote home from Oxford about its conservatism; he said, "Whatever any Massachusetts town unanimously affirms, Oxford denies." Not long after the late war for the Union an eminent scholar and soldier of Massachusetts was walking along the ancient avenue of limes at Oxford, and all the antiquity of the place seemed expressed in that sentence just quoted. But just then a college band, behind the hedge, struck up "Marching through Georgia!" The soldier felt as he listened somewhat as the scholar felt soon after, in Merton Library, when, after noting the old books chained to the wall, he discovered that the last two volumes issued to a student were those of the most sweeping radical of our time. These little things are significant of large things. The ancient frame of Oxford remains from age to age, but the portrait is always changing. Of the thirty or more young Americans now at Oxford, it is probable that a moiety have been sent with the intention that in one direction or another they should imbibe such views as are now called "reactionary," and again "old-fashioned," according to the describer's attitude. Others may be sent because their parents' or their own imaginations have been fired by the "heroics" of *Tom Brown at Oxford;* while it is equally probable that a larger number are not sent because of the "prosaics" of the same book. But it is to be feared that all of these parties are conceiving of Oxford as far more stereotyped and stationary than it is, and of its influence as more uniform than it is. For one thing, that little cosmos has got too large for views of any one set to impress themselves upon it exclusively. For another thing, the antiquity about them being secure is taken for granted, and Oxonians not unfrequently exhibit an Athenian eagerness to hear some new thing. It seems but a little time since we were all reading *Tom Brown*, and it is likely that American impressions about life at this university are mainly derived from its graphic pages; but I have already said enough on a previous page to suggest to my reader the fact that the Oxford of to-day is by no means that which Thomas Hughes saw. No doubt the same faults survive to some extent, but they are no longer characteristic. The purse-proud *régime* has been reduced, the tandem-driving lords and snobs are unknown; the "liqueurs at a guinea a bottle and wine at five guineas a dozen," the startling cigars and the gambling, which were familiar to

the young gentlemen of "St. Ambrose," are now nearly as mythical as the name of that college. You may hear professors or clergymen complaining of this or that "set" in some college as "fast," but when the examples are quoted, they are likely to astonish by their moderation any one who has drawn his ideas of Oxonian fastness from *Tom Brown*. The "Town and Gown" row is a thing of the past, so is that unappeasable thirst for beer by which the youth of that time seemed to have been impelled. Although there is still such a singular degree of freedom allowed the young men in their rooms in the matter of spirits, a student who should any where be seen tipsy would lose caste entirely among his fellows; and this is true of any college in Oxford. It is impossible to name all the causes which have brought about these changes: a main one certainly is the largely increased severity of the examinations, as compared with what they were thirty years ago. Tandems can no longer drive through the "little-go." Wine parties are incompatible with "moderations." Gladstone won honors at Oxford with half the efforts that would now be required. In one sense the advantage of this increased severity may be questioned: it leaves the student little time for general reading; but morally the effect has been to do away with that unpleasant tendency to imitate London club life which was once so manifest. But there have been influences of other kinds at work also. What would the dons of the last generation, who could not tolerate Shelley's fondness for chemistry, have said could they have foreseen that ere the next had closed a Board of Studies would include in their list the works of Gibbon, Hume, Voltaire, Goethe, Lessing, Carlyle, Lyell, Mill, Darwin, Huxley, Tyndall, Hooker, Draper, Gray, and Sterry Hunt!



MERTON COLLEGE CHAPEL.

It is, however, perilous to generalize concerning Oxford, for, notwithstanding a certain unity about the place, the colleges have striking differences. One is rich, another poor; one Liberal, another Tory; and any old fellow you meet will display you their respective characteristics as if they were so many medals with legends. A slightly cynical one read them off to me very easily. One consisted of "tradesmen's sons fond of dash and stupid practical jokes;" another, "the refuge of abuses;" a third is "a boat club;" a fourth, "not exactly fast, but easy;" a fifth, "Crœsus;" and so on, some, of course, having pleasanter labels. With a sufficient number of salt grains in each case, the descriptive phrases have their truth. Sometimes the humorous judgments so passed by the students on each others' colleges have the startling effect of being echoes of their history. Thus the college said to be overfond of stupid jokes is dear old Merton; and it is odd to reflect that just there Duns Scotus devoted himself to those "subtill quiddities" which embalmed his name in the word *dunce*. The first noted man connected with Merton was Roger Bacon, astrologer; the last was Henry Manning, cardinal. Trinity College, the ancient "nursery of the monks of Durham," bears the repute of being "dull and respectable." What else should we expect from the college which expelled Landor and fostered Bampton, founder of the lectures? Baliol is sometimes called the "nest of heresies." Beside it the heretics of their time, Cranmer, Ridley, Latimer, mount guard on their monument. Near them still hovers the spirit of Shirley, which sang:

> "Only the actions of the just
> Smell sweet and blossom in the dust."

The stories of these colleges are romantic; there is an anecdote for every carved stone of them; but I must leave such antiquarian seductions. Each college had its special reason to rise, and each has put forth its strength in the great race after truth, and also, it must be confessed, after power. After I had listened to a great deal of sensible

THE WESLEY PULPIT.

persiflage about the various colleges, and then witnessed a splendid regatta on the Isis, I sat meditating in the Clarendon Hotel. The shade of Shakspeare, who, close to where I sat, used to flirt with pretty Mrs. Davenant—more anxious to win her smiles than the grand compliments of Professor Butler, who listened to his plays and set him above Terence—seemed now to re-appear and spread the scenery of the past before me. All Oxford was part of the great stream of Time, and the colleges were so many well-manned boats starting on their competition of centuries for an unknown goal! Each represents some special party, belief, tendency, of its time; and each will "bump" the other, as the phrase goes, if it can. Some oars wax weary and faint by the way, and give up their place to others; some, again, that began feebly unfold undreamed energies. Perhaps if some that started on the grand course could have foreseen just where they would have been anno 1878, their oars would all have stopped together—not another stroke! We sometimes think of those who lived and searched for truth in the centuries before the Reformation as reposing in a blissful harmony because they were not divided on the particular questions that divide us. But when that first dawn of freedom sent its morning breath over Oxford it found all the colors of subsequent controversies awaiting the signal of liberation; each floated out over its toiling crew, and so each passed on to our own time, which sees the stream lined with barges representing every variety of ideal and every degree of enthusiasm in its pursuit.

And now among the many starters in my mystical regatta, one swift boat rivets attention. It is marked "Lincoln." I asked a fellow of Baliol, "What sort of college is Lincoln?" "Small, scholarly, rather poor," was the reply. But in the historic perspective it loomed up large and rich; for there appeared to Oxford its prophet, whose warnings have never been outlived. Having just listened to a lecture by Max Müller on fetich worship, I found an even better explanation of that primitive cultus in the feeling with which I presently stood before an old oaken pulpit in an entrance hall at Lincoln. In that pulpit John Wesley preached his first sermon. It has not been used for a long time; it is not in the chapel, yet stands where it generally stood in old times, reminding us of the period when the chapel or church was for "services" before altars; preaching was only occasional, the pulpit being brought in when it was wanted. This pulpit has not been "wanted" for some time, in one sense; but it may be doubted if the Oxonians of to-day can hear from any other pulpit discourse more impressive than that which may still strike an attentive ear from that silent pulpit in the hall.

Passing up the stairway, under guidance of an accomplished fellow of Lincoln, who well represents the reverence there felt for the memory of Wesley, I entered the rooms where resided the first Methodist—"sometime fellow of Lincoln College"—and was there welcomed by a handsome young gentleman of the Church of England. Beautiful rooms they are, their large quaint windows looking out, both front and back, over velvet greensward of quiet courts bounded by wall and turret, carved by reverent art, and softened under touch of the ages. Never, perhaps, to any youth might such charmed scenery have been more emblematic of the fair outlooks and hopes that stretched before the eyes of that member of the house of Wellesley. Why should he not sit here as serenely as this clear-eyed youth who welcomes us into his neat and tasteful apartments? Bunyan, the tinker, might easily dream of his lowly and poor roof as

included in the City of Destruction, but it appears strange that the cultured John Wesley, amid all this quiet beauty and amid these picturesque walls, should groan in spirit after any city of other foundations. The few pathetic traces of him that remain in Lincoln College tell plainly how little he could find there any continuing rest. How slight in importance may have seemed to the students and professors the absences accorded to Mr. Wesley on every chapter day from 1739 to 1751! how pregnant they are in the light of history!

"*Nov.* 6, 1739. Leave of Absence was granted till the next Chapter Day to Mr. Wesley.
"Richard Hutchins, Sub-Rector."

Then there is the following entry:

"*May* 6, 1743. At a Chapter held this day, Mr. Rector took upon him to preach upon the Feast of All-Saints as usual. Mr. Wesley and Mr. Fenton were appointed by the Sub-Rector to preach, the former on the Dedication of All-Saints, and the latter on the Feast of St. Michael."

May 6, 1749, the same entry. Finally we have in John Wesley's own hand the following resignation:

"Ego Johannes Wesley, Collegii Lincolniensis, in Academia Oxoniensi Socius, quicquid mihi juris est in prædicta Societate, ejusdem Rectore et Sociis sponte ac libere resigno: Illis universis et singulis perpetuam pacem ac omnimodam in Christo felicitatem exoptans.
"Johannes Wesley.
"Londini, *Kalendis Junii, Anno Salutis Millesimo, Septingentesimo, Quinquagesimo primo.*"

After this "spontaneous" resignation of his fellowship and all its rights—"wishing them all and each perpetual peace and all happiness in Christ"—by Wesley, there follow these entries:

"*June* 21, 1751. It was ordered that the Lincolnshire Fellowship void by the Resignation of Mr. Wesley should remain void till next Chapter Day.
"Richard Hutchins, Sub-Rector."

"*May* 10, 1753. Robert Kirke, A.B., born at Northorpe, in the County of Lincoln, was unanimously elected a perpetual Fellow of Lincoln College, into a Fellowship belonging to the County of Lincoln, void by the resignation of Mr. Wesley.
"Mich. Robinson, Sub-Rector."

Lincoln College was founded expressly to wage war against the ideas of Wycliffe. Its chief literary treasure now is the MS. of Wycliffe's Bible; its chief fame is to have produced the great man of whom the "morning-star" was forerunner—John Wesley.

There is an old but still flourishing grapevine in the court-yard of Lincoln College which has a curious story. The college had become rather poor, and amid its struggles the archbishop chanced to visit it. The dean of the college was appointed to preach before him on the occasion, and selected for his text Psalms, lxxx. 14: "Return, we beseech thee, O God of hosts: look down from heaven, and behold, and visit this vine." It need hardly be said that in the discourse Lincoln College was symbolized by the vine, and its needs disclosed. The archbishop never forgot it, and remembered Lincoln handsomely in his will. On receiving the bequest this vine was planted as a memorial of the incident. How many even more telling sermons than that of the witty dean may that vine—lasting through generations

SKETCH OF DR. PUSEY.

—have sweetly preached to the youth who cherished it! I almost fancied I could see the meditative Hervey with his pupil Wesley pausing beside it to dream of the heart seeds, seeming little and lowly, that yet take deep root and climb on imperishably.

The heart of Wesley took root and climbed on at Lincoln. It was on account of marriage that he resigned his fellowship; but Sub-Rector Hutchins, whose name appears in the above entries, was a devout Methodist, and he left a kindly bequest of money to supply the poorer students of Lincoln with better dinners. This fund still does good service, and it is large enough to provide also the annual "Hutchins Dinner," which all members of the college enjoy. I was somewhat surprised to find that the college is not patronized by Methodists—or "Wesleyans," as they are called in England—there being no student there of that denomination. Unitarians and other Nonconformists favor it, and a liberal spirit prevails around the spot where a mighty movement began; such a spirit as would win the approval of the great man whose faith was so perfect that it could fearlessly set forth the holy life of Thomas Firmin, a Unitarian, and say, "I am sick of opinions; give me the life."

My belief is that the flaming out of Wesleyanism at Oxford was characteristic, that the university never had a truer son than its founder. It was really a moral move-

ment—a volcanic tongue leaping forth amid frivolity, intellectual dilettanteism, and selfishness, pretending to represent religion, sitting in the seat of Moses and Christ. And if the Tractarian movement be examined, and the moral condition of Oxford, as described by Mr. Froude in his novels, be considered, it will be found that it too was far more moral than theological. When Theodore Parker first came to England he wrote from Oxford (date October 18, 1843) to Dr. Francis, at Cambridge, United States: "Really the rise of this party is one of the most encouraging signs of the times. The old Church is not so dead as men fancied. Some are found who say to the fat bishops and easy deans, 'Go to the devil with your livings and your rents, your tithes and your distrainings; let us put life into these old forms which you are humbugging the people withal.'.....Here is Dr. Newman—gives up a rich living out of conscientious scruples! Dr. Pusey, born of one of the oldest families in the kingdom, which, at Pusey Hall, keeps a horn of gold given them by Canute—a man bred in all tenderness—rides on the outside of coaches, and submits to all manner of hard fare, to save money to give to the poor and promote education, Christianity, and the like of that. He says a man in good circumstances ought to give up a fourth part of his income for benevolent purposes—and does it."

In his study at Edgebaston Oratory, Father Newman has a picture of Oxford, beneath which he has written, in Latin, the words: "Son of man, can these bones live? Lord, Thou knowest." Father Newman left Oxford for the Church of Rome in 1845. This year—at the close of one generation from that sad parting—he visited the place again, and for the first time since he left it. I was told that while he was sitting at dinner in his college (Oriel) he asked an old friend, a clergyman, seated beside him, what changes that generation had brought to Oxford. The reply was that they were so vast that they could not be told, but the main change was "the disappearance of the ecclesiastical spirit." Which means that, in Father Newman's sense, Oxonian bones are drier now than ever. Since Tractarian breath ceased to stir them, all questions concerning the antiquarian authority of the Church and priestly powers have failed in interest. The recent expulsion of a youth from the new Puseyite college, Keble, because he turned Catholic, is enough to indicate the horror with which even High-Churchmen view any possible recurrence of ecclesiastical controversy. The question of Newman's time is nearly fossilized. The principle of Anglican supremacy in the Christian Church has been settled, and in the way which English pride—to name the lowest force—from the first, made its settlement certain. The notion that the great English Church could be induced by any antiquarian considerations to acknowledge a foreigner—and a foreigner who does not speak English—as its supreme head, is a phantasy whose indulgence suggests drill in believing things because they are impossible. There is no man that looks down more defiantly on the Catholic than the extreme High-Churchman. Rome is the Anglican's rival. The transient conflict has left its sorrowfully picturesque memorials in the famous brothers parted to extremes of right and left: a Catholic Newman, a theistic Newman; Froude, the captive of Rome, Froude, the skeptic and bitterest enemy of Rome; Matthew Arnold, whose God is a stream of tendency, and Thomas Arnold, who has lately, and for the second time, entered the Papal Church. But these all belong to the past. The Tractarian controversy has bequeathed to Oxford a conflict not about churches, but concerning the fundamental principles of faith. Rationalism and Christianity have taken up the swords, and if Belief can manage to survive the thrusts of Disbelief, it finds comparatively easy the task of adjusting itself to some existing Anglican phase of faith and worship.

The competition at Oxford just now seems to lie between the Broad or rationalistic party and the High-Church party. They are both equally active and flourishing. What, perhaps, is chiefly remarkable is the readiness with which the Anglicans, or Puseyites, take on the armor of progress in their methods, and the facility with which they adapt themselves to new needs. A striking instance of this has just come within my personal knowledge. A lady of wealth, deeply interested in the higher education of her sex, recently gave £1000 to form the nucleus of a subscription to found at Oxford a college for young women similar to that (Girton) which is doing such good work at Cambridge. Those who were intrusted with the matter naturally proceeded to consult with the Broad-Church professors and teachers of Oxford. From among these a committee of gentlemen and ladies was formed to consult about the matter. It was concluded that the monastic atmosphere still lingered in Oxford sufficiently to make it a hazardous undertaking to start there a regular female college, but that it was practicable to start some such institution in the form of a boarding-school for young ladies. Meanwhile, however, the High-Church people there heard of the scheme, and instead of preparing, as was expected, to combat it, they held a meeting and constituted a committee to take the lead in it! Throwing monastic notions of women to the winds, they sent word to the Broad-Church committee that they were

prepared to coalesce with them for the purpose of practically inaugurating female education in Oxford of a kind which would train girls for the university examinations, already opened to them; and the result was the formation of a strong committee—which is at work while I write—composed of prominent members of both parties, and agreed that the new institution shall be free from bias from either side. The teaching shall be purely secular, each party reserving to itself the right to found subsequently a school in its own interest. This determination of the High-Church scholars not to be behind the times in meeting the growing demand for female education, not to leave women to preserve in the school they are sure to have any tradition that it was gained against High-Church hostility, indicates a flexibility and courage in that wing of the Establishment for which its opponents had not given it credit, and a progressive spirit which forbids the Broad-Church to anticipate an easy victory in the future.

ORIEL COLLEGE, OXFORD.

The near prospect of this innovation upon the ancient habits of Oxford—already far advanced in the many lectures, such as those of Ruskin, Rolleston, Max Müller, and others, which have long been crowded with women—recalls the honorable historic connection of that sex with the ancient university. The corner-stone of the whole city and university was the monastery founded by Frideswide; and in the cathedral, which is her monument, the most beautiful of the windows is that which records her legend, in which she is seen taking refuge from her persecutors in a pig-sty. In December, 1141, the Empress Maude held Oxford Castle when it was besieged by King Stephen for a long time. She was forced at last to fly, making her way over the ice on foot and in a snow-storm, she and her maidens escaping detection by being clothed in white. In 1646, while Lord Arundel was defending Oxford against the Parliamentary forces, his lady defended Wardour Castle like another Maude. When Sir Edward Hungerford and his 1300 Roundheads summoned her to surrender, she replied that she "had the orders of her lord to keep the castle, and those orders she was determined to obey;" and though eventually she had to capitulate, it was on honorable terms.

Though Baliol College bears the name of John Baliol, father of a King of Scotland, the statutes of its foundation bear the seal and name of his wife Devorgilda, the date being 1282, thirteen years after her husband's death. Devorgilda carried about with her the embalmed heart of her husband in a silver casket, and no doubt it was in pursuance of his wishes that she founded the college; yet I was glad to find that the students of Baliol have named their debating club "The Devorgilda Society." Miss Hannah Brackenbury recently built a new front for Baliol, and founded scientific scholarships. Queen's College gets its name from its founder, Queen Philippa (1340), and many queens have since befriended it. Yet for many ages Oxford confined its homage so strictly to "the Virgin Mary and St. Catherine," to whom Devorgilda dedicated her college, as to take little interest in terrestrial women; and in 1779 an Oxford woman was taken by her husband to the market-place with a rope around her waist and sold to a man for a few shillings. There is still a sort of dread among many good men in Oxford lest the admission of women to the university may do away with the antique flavor of its life, and that when the Bachelor is in proximity to a Bachelette, the Arts they pursue will be of a kind not exclusively scholastic.

If ladies are admitted to studies at Oxford, one anomaly is likely to disappear, that is, the waste of educational means and force. An indication of this waste is the vacancy of the libraries, but that is only one symptom among many of the fact that Oxford is leaving undone much that it might do, while it is doing much that might as well or better be done elsewhere. If the large number of youths who come to Oxford because it is "the thing" were replaced by young women who hunger and thirst for its real advantages, one would not find so many grand institutions almost empty and idle. But no replacement is required; Oxford could as easily be educating four thousand as two. Here, for instance, is the magnificent Taylor Institution, erected at a cost of some £50,000, and with an endowment of over £2000. It has a fine art gallery, containing the original drawings of Michael Angelo and Raphael, and the "School of Athens" (which cost 3000 guineas), forty sketches by Turner, presented by John Ruskin, and fine specimens of Vandyck, Teniers, Canaletti, Hogarth, and Reynolds. It contains a spacious library, six lecture-rooms, and a fine reading-room with the leading periodicals of the world. In it, also, is the art school, with its fine collection of studies, endowed and supervised by Ruskin. This great institution is not half utilized, and more than half of those who do now use it are ladies, mostly the families of professors. In England the excess of the female over the male population in number is between 800,000 and 900,000. Until these, for whom statistics show no possible husbands, are taught and enabled to pursue some art or career which will yield them both physical and intellectual resources, a large proportion of them must still find their way, like the Oxford wife of a hundred years ago, to the market-place, though the sale of her may not be so coarse, and the price paid may often be disguised by the marriage ring and orange blossoms which too often hide the pain of bartered affections.

Social life at Oxford is by no means what it should be. The professors have often but small salaries, and the number of students is so large that the difficulty of looking after their private entertainment is enormous. The town has no theatre; the college authorities, having the right to veto any amusement, have steadily opposed the establishment of a theatre, though they encourage concerts. The students are limited to outdoor sports and such society as they can find among themselves. The Sunday is largely utilized for social intercourse; on that day they manage to breakfast and dine and take long walks in groups, and some of their debating clubs meet on Sunday evening. Their Union Reading-Room is also open and well filled on Sundays, so that they may keep up with the news of the world and periodical literature. Yet there is a want of more female society for young men, who sorely miss the charms of English homes. Some compensation, however, is found in the friendships and intimacies which these youths form with each other, leading to pleasant introductions to each other's homes, and exchanges of charming visits during the vacations. An American student told me that he and his young countrymen at Oxford were rarely without cordial invitations to the best English country residences for the vacations, and these visits to their fellow-students were made the occasion of a delightful round of dances, picnics, excursions, and all manner of festivities. It is probable that when the large additions now proposed to the professors' salaries are made, the social relations of Oxford itself will become more satisfactory; but it would be imprudent at present to whisper even in America that a female college there might possibly contribute to that end.

Like the British Constitution, the organic law of Oxford is considerably "mixed." It represents an interminable series of adaptations to changing needs and demands growing out of different social epochs. In this way it answers to many lines of social evolution. In the matter of residence every variety of circumstance is considered and met. The under-graduate may lodge in the college or in one of the halls (public or private), or may board in a lodging-house licensed by the college authorities; and this implies a large range of prices, to suit the rich and the poor. Every year a list of the licensed lodging-houses is printed, with their prices, which vary from seven to sixty-five shillings per week. The aim of the colleges is for the under-graduates, when they first enter, to reside within college gates, and for those who have been there some time to adjourn to lodgings outside, making way for the younger. After the completion of eight—in some colleges twelve—terms, an under-graduate is usually required to remove to lodgings, but all those who so reside outside may at their option dine and "battel" in college. The lodgings are subject to the same regulations as the colleges and halls. These halls, by-the-way, are institutions which have probably grown out of ancient lodging-houses, having gradually taken on some of the educational appliances of colleges. It will be readily understood, therefore, that generalizations as to the cost of residence and study at Oxford are apt to be misleading, yet I have found no reason to doubt the substantial accuracy of the following statement in the *Student's Hand-Book:* "It is a matter of experience that a student who resides within a college or hall can, with economy, obtain the degree of B.A. for a total expenditure of £300. This esti-

mate includes board, room-rent or lodging, and washing, for twelve terms of residence, tuition and miscellaneous college charges, admission, examination, and degree fees; the necessary expenses which it does not include are clothes, books, railway fares, and the cost of living in the vacations. Many students have been known to obtain their degree for less than the sum above mentioned, but this has required a more than ordinary amount of thrift and self-denial, and possibly, also, a forfeiture of some collateral advantages which university life brings."

Yet it must be added to this that there is a general and constant tendency among the colleges to adapt themselves still further to the increasing demand for their advantages resulting from extension of them to Nonconformists, by reducing the charges. And it is a notable fact that the lead in such reduction has been taken by the newest of the colleges, founded on High-Church principles. Keble College has underbid all the rest by fixing an annual charge of £81, payable in advance in three installments, this including all ordinary battels, *i. e.*, the rent of furnished rooms, board, college dues, tuition, and servants. It does not include washing, lights, or beer. A few extras, but not required, are provided at a fixed tariff, but are not allowed to exceed £3 per term. Although the three installments would imply three terms, there are really four in the year; and since twelve terms reach the B.A., it follows that the whole cost to a student there would not exceed £275 for the three years. Keble College, built by subscription as a memorial to the author of *The Christian Year*, was incorporated by royal charter (June 6, 1870), which declares it to be "founded and constituted with the especial object and intent of providing persons desirous of academical education, and willing to live economically, with a college wherein sober living and high culture of mind may be combined with Christian training based upon the principles of the Church of England." The cheapness which Keble has instituted must not be supposed to imply any discomfort. It is a magnificent building, and has excellent rooms, and though there is observable a plainness in the fare as compared with some other colleges, it is wholesome and abundant. It can hardly be doubted that its simple and definite arrangement, enabling every student or his parents to estimate precisely the expense to be incurred, will have an effect upon other colleges. It will hardly do for "Broad" or "Evangelical" colleges to allow the principles of Pusey and Liddon—and they are both on the council of Keble—to be taught less expensively than their own. There was a natural impression abroad that Keble was to be a ritualistic nest, where young men were to moult their

DR. HENRY PARR LIDDON.

Anglican feathers and presently migrate in scarlet plumage to Rome. But Keble has just had the lucky opportunity already referred to of reversing that impression: a youth who turned Roman Catholic there the other day was instantly expelled, and was taken in at Hertford College. It is likely, therefore, to become a very popular college amo ng the Church folk, and the fact that the fuller extension of education to the poor should come from that direction is, to the university, of a quietly revolutionary importance in this whole matter of expenditure. Even more important than the smallness of the special annual charge fixed by Keble College is the standard it has raised of "plain living and high thinking." For twenty-five years now there has been a silent struggle going on to lay low the standard of lavish expenditure which young "swells" of the aristocracy had set up, and snobbish parvenus raised higher, and one may hope that Keble has given it the *coup de grace* by making economy compulsory on all—the rich as well as the poor.

It may here be remarked that it is the steadfast aim of all the colleges to prevent any distinction being drawn or recognized between rich and poor in any way whatev-

er. It is remarkable that in a country where caste prevails with a strength only less than that it maintains in India, the ancient seat of learning realizes the high equality of minds which the Hindoos declared in their sacred books. The Padma (Lotus) Purana says: "Learning should be rescued from every consideration of high rank or low—a consideration which can not for a moment be compatible with instruction; and the heart should be kept free from all such infatuation." Unquestionably Oxford has its swells and snobs, but whatever they may import in that way is absolutely unrecognized by university and college law and administration. There is one example of the determination that no line shall be drawn between wealth and poverty which Harvard would do well to follow: Oxford scholarships are bestowed for knowledge alone. Such pecuniary aids to the student are thus by no means signs of his poverty, but may be and are sought as earnestly by the sons of the wealthy as by the poor. Were these scholarships and exhibitions—more than 700 in number, and bringing an aggregate of £60,000 annually to successful competitors—bestowed only for the easy qualification of poverty, or were that even considered, each would become a stigma. Many a poor but proud youth would, in such case, fear to apply for the aid he really needs, and which he may now earn by efforts which involve no loss of self-respect, but the reverse. These scholarships average about £65 annually, the tenure being generally for five years; and there is no subject of study to which a student may incline to devote himself where he will not find at least one or two, oftener many, endowments of this kind, meant to reward and assist persons like himself, so that all the competitors need not concentrate themselves upon the same prize, and the chances of success for each are generally fair enough to inspire effort. There are some anomalies still surrounding some of the fellowships, but even those that are what is called "close"—*i. e.*, open only to persons in holy orders, from a particular county, etc.—are yet independent of all considerations of either rank, wealth, or poverty.

Admission to Oxford is easy—some think too easy in some of the colleges. The applicant is examined in some Greek play, generally Euripides, or in Homer and Thucydides, in Virgil or some other of the Latin classics; must translate a short English passage into Latin prose, answer some questions on grammar, show fair familiarity with arithmetic, and know something of Euclid or algebra. But if he is found to possess special interest in and excellence in any one of these studies, he is pretty certain to be admitted to matriculation even though he be weak in the rest. And this care taken at Oxford to respect and cherish every special ability accompanies the student through all his examinations, though these, indeed, become very severe when scholarships, still more when honors, are applied for. The candidate for the degree of B.A. is allowed a "conscience clause" with regard to examination in matters of faith and religion, for which he may substitute some period of ecclesiastical history, or some scientific or philosophical work; and for examination in the Gospels he may substitute some other Greek work from a list provided by the Board of Studies. Between matriculation and "passing" lie three years and three chief examinations—1, responsions; 2, first public examination; 3, second public examination. The subjects for those who do not seek honors are divided in three groups:

A. (1) Two books, Greek and Latin, one being historical or philosophical. (2) Some period of Greek and Roman history. (3) English composition.

B. (1) English history, or a period of English literature, or a period of modern European history. (2) Political and descriptive geography. (3) French or German, including composition in the language and a period of its literature. (4) Elements of political economy. (5) A branch of law.

C. (1) Elements of geometry, including geometrical trigonometry. (2) Elements of mechanics. (3) Elements of chemistry. (4) Elements of physics.

The candidate is examined in three of these subjects, of which not more than two can be taken from any one of the groups, and of which one must be either A (1) or B (2).

If the candidate applies to be examined for honors, he is expected to have a much more matured knowledge of the class of subjects in which he claims honor. For in this case the subjects are divided into "Honor Schools:" these are "Literæ Humaniores," including Greek and Latin, their language and histories, logic, and the outlines of moral and political history. This may be passed by any one who has mastered Homer, Herodotus, Thucydides, Xenophon, Cicero, Polybius, Plutarch, Plato, Aristotle, Locke, Butler, Hume, Kant, Pausanias, Pliny, and a few such books as Bergk's *Poetæ Lyrici Græci*. But this examination will relate to the arts and antiquities and peculiarities of Greece and Rome, and involves some genuine philosophical culture, and it can not be passed by "cram." The same may be said of the honor schools of mathematics and of natural science. The examinations are not extended and cumulative, but they are by men who know thoroughly the crucial points to deal with, and one who has gained these honors would be pretty sure to possess the power to teach them. There are honor

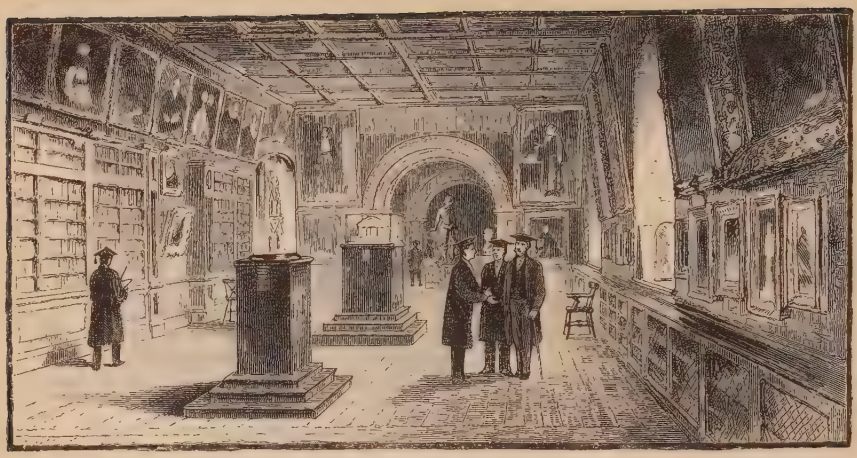
MAX MULLER.

schools of jurisprudence, modern history, and theology, but to enter further into these details here would carry me apart from my present purpose. Enough has been said to illustrate the character of Oxford to which I have before referred—its tendency to foster special abilities, and its concentration upon the work of cultivating leading minds for the world of thought and learning.

If Oxford continues that steady development of its educational resources which has gone on so vigorously ever since Parliament began to investigate its pecuniary resources, it will, at no distant day, be possible for a man to go there and learn thoroughly any thing and every thing knowable on any subject whatever. This is not quite so now, but it must be so in the end. Some persons smiled when the professorship of Chinese, filled by the learned translator of Confucius and Mencius, was established, and the under-graduates have already a legend that its one scholarship has been awarded to a youth on the ground that he was the least ignorant of the candidates—being the only one; but Dr. Legge's chair is the predecessor of others that may excite smiles for the moment, yet mean eventual fulfillment of the whole circuit of knowledge. Hitherto, if a young man became interested in the Oriental and philological and mythological studies which combine to make such men as Bopp, Von Weber, Haug, Whitney, Curtius, he must go to Germany. But at this very time the University Commissioners are establishing three new chairs—one of Zend and Persian, a second of Romance or Neo-Latin languages, a third of classical archæology. Again, now that there has been formed in London a "Folk-lore Society," it is to be hoped that scholars will arise to do for British legend and mythology what such men as Grimm, Manhardt, Wuttke, and Simrock have done for German fairy-lore, myths, and Aberglaube. In that case such will find, in addition to the three new chairs just mentioned, a professor of Celtic, Monier Williams, Max Müller, and Sayce representing every region of Sanskrit and comparative mythology, and a powerful school of Arabic, Syriac, and Chaldee, which, as I write, is being consolidated out of some

smaller professorships, one being that which Professor Chenery has just left on assuming editorship of the London *Times*.

The immense progress, activity, and enlargement of scope which have characterized Oxford in recent as compared with former years have been the result of two strong causes. The first of these is the operation of the University Tests Abolition Act. This act abolished subscription to any and all formularies of faith as a condition of admission, or taking lay degrees and lay academical or collegiate offices; freed students from obligation to attend any lectures to which they, or their parents or guardians if they were minors, should object on religious grounds; and enabled persons of all creeds, or none, to hold offices, to teach, and to establish halls or schools in connection with the university. All professorships and fellowships were thus left open to the whole nation, with certain exceptions, these being such offices or fellowships as at the time the act was passed were held under the condition that their beneficiaries should be in holy orders. This restriction was considerable, but it still left the college doors open to a very large number previously excluded. Not less important was the tendency the act inaugurated—the tendency to inclusiveness. Toleration was announced as the future fashion at Oxford. Unhappily this new fashion has just received a check. A wealthy Baring, a rigid Churchman, having offered a large sum of money to endow fellowships on condition that they should be restricted to members of the Church of England, Hertford College agreed to accept the same, and to defend the restriction on the ground that the Act of Parliament did not apply to foundations that should be made in future, but only to such as were in existence when it was passed. A Nonconformist student having sued that college to compel the examiners to examine him for one of the fellowships so restricted, the court decided against him. This has brought much wealth to Hertford College, which was previously poor, and more surprise and disappointment to the country. The London *Times* and the journals generally have been severe upon Lord Coleridge, who gave the decision, which allows the Church to build up again in the university a close system which Parliament has emphatically discredited and condemned. Such a result might have been prevented had Parliament inserted in its act the prospective word "hereafter;" but none the less has Hertford obtained its Baring fellowships by a quibble, and none the less is the disgust of the nation that its Parliamentary work should have to be done over again. For it is certain that England is resolved that its entire system of education, from the public school to the university, shall be free to all the Queen's subjects, whatever their religious opinions, and this resolution will not be reversed.



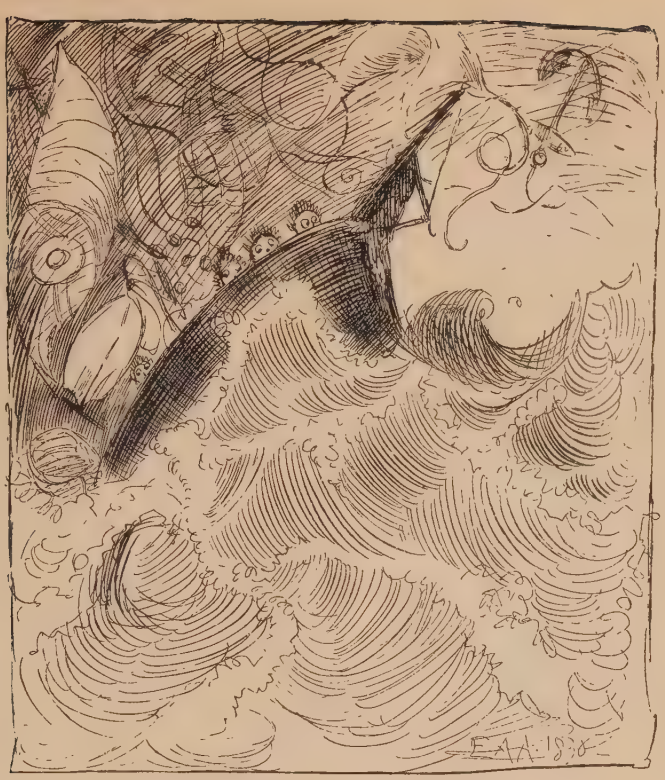
The other force which has brought about the new activity of Oxford has been the commission which Mr. Gladstone set to work (1877) to estimate the resources and income of the colleges, and report how they are used. Now Oxford University is really a mine of wealth. Some of the colleges have little, but others have vast possessions, and estates from which a vast accession of money is just about to come in. The clamor of scientific men that this money, having been bequeathed for national education, should be all utilized, and that what the colleges did not need should be utilized in promoting scientific research, set the Oxford folk to devising means for using it themselves. Thus colleges were repaired, chairs made stronger, and the entire machinery furbished up; and there being yet a large surplus, the Oxford men are making arrangements for greatly extending its usefulness. The Commissioners have just reported that the improvements they design for Oxford have two principal objects in view: (1) the due representation at Oxford of every considerable branch of knowledge; and (2) the due participation of the university itself, as distinct from its colleges, in the direction and improvement of the studies of the students. They propose to increase the stipends of nearly all the professors, some to £500, still more to £700, and others to £900. The Bodleian Library is to be improved; a Museum of Classical Art and Archæology to be established, and maintained by an annual grant of £500. A system of pensions for retired professors is proposed; open scholarships to encourage special branches of study are to be founded; and research is to be encouraged by the employment of properly qualified persons on definite work and investigations. Occasional lecturers on branches of learning not fully provided for are to be employed. There is also to be a fund created the disposal of which is to be left to the discretion of the university authorities in meeting emergencies or unforeseen wants. The great advantage to be gained by all this is that the annual income of Oxford will all be set to work, turned to culture, and nothing left to be a temptation to any body who may indulge private views concerning the proper direction of an idle surplus.

After all this has been done, a great deal will still remain to be effected before Oxford can fully and impartially fulfill its duties to the world. The scholarships are not included in the relief given to persons unconnected with the Established Church, and though, fortunately, the great majority of them are "open," too many still remain as bribes to thought, on the one hand, and stimulants to sectarian jealousy and bitter-

ness in those who find themselves deprived of such aids and rewards solely on account of conscientious convictions. Now that Dissenters are admitted, the preservation of such ancient partition walls can hardly survive much longer. The Church is quite strong enough at Oxford to dispense with them.

After all, I can not look without some misgivings upon some of the present tendencies of this great university. Unquestionably most of the changes that have supervened thus far were structural and beneficial; the methods of the university and its colleges grew up of old in obedience to definite ends, and their development has mainly been along the lines of England's highest character—the eternal parallels of Conduct and Culture. The colleges, with all their varieties of flavor, if not fruits of one garden, are flora of one clime. But this is not the clime of other universities—not even of Cambridge, the one most like it. Oxford, as we have seen, has but little apparatus for making a student behave himself if he is not so inclined; its discipline is directed chiefly to protecting itself from being compromised by any student, and for the rest it deals with its two thousand as if they were as sensitive to the admonitions of Plato and Plutarch as their predecessors were to saintly meditations. That this method has been attended with a notable success is certain. But corresponding with this there is a method of intellectual training strikingly different from any found in other seats of learning. This I have already intimated in saying that a student is very apt to "pass" if he is found to be excellent in any one branch, though he may be weak in others. Almost as much as when it was devoted to the training of monks, the finest appliances of Oxford are for those who aspire to some particular and unworldly aim. It is, indeed, not now an otherworldly aim that is specially aided, nor is it one specialty alone; but its peculiar value, as it appears to me, is for those who are consecrated to the purely intellectual life. If a young man aspires to devote himself to a chosen branch of culture for life; if he aims, with true love for his selected study, to be a historian, archæologist, philologist, comparative mythologist, literary essayist, critic, art critic, professor (especially in the Literæ Humaniores), or poet, then he will find Oxford above all other places his land of milk and honey. But he will find many universities more helpful if he seeks to be trained for success in the commonplace work of the world—the every-day tasks of money-making, bookmaking, paper-editing, preaching, legislating. That Oxford is making strenuous efforts to include the popular objects along with those more legitimately following its original aims seems plain; but whether it shall ultimately succeed in this or not, it has not yet succeeded, and still its best work is done in teaching the teachers. And for the time being it is unfortunate both for the university and multitudes of young men that the fact just stated is not more widely recognized. It has become the fashion to send young men to Oxford, for it is a doorway into good society, so that this is numerically the largest of the universities; but one may almost say it should be one of the smallest. Of the two thousand youths now at Oxford, one-third is a large proportion for whom to anticipate the highest—the unique—benefits which Oxford can supply. It is to be feared that another third is but too small a proportion for whom harm even may be apprehended from what to the others are the very excellencies of the institution.

Thomas Carlyle, in his famous rectoral oration at Edinburgh University, spoke of the changes which the art of printing had superinduced on the conditions to meet which the old universities arose in Europe. Seven centuries ago the young men sought out famous scholars to listen to their teachings, whereas for a long time such teachers may find out their students in their homes by means of books. Yet, added the Lord Rector, universities still have—and for a long time will continue to have—their high uses. And this is certainly true. The best teaching is personal, and it is not more likely to be superseded by books than high art by photography. The teaching at Oxford illustrates this remarkably. Oxford not only has its great Bodleian Library, but each college has a fine library of its own; yet in visiting four or five of these on a pleasant day I found not one reader engaged in them. Nor are many books found in students' rooms. Here are the reasons: the examinations are too severe to admit of much various reading; and the teaching which gains the best success is too intimate to be carried on by books—as a main method. In silent (written) examinations "cram" accomplishes comparatively little. The young men who make the most of Oxford, who win its unsectarian fellowships and honors, are those who by a genuine devotion to their studies have gained the friendship and intimacy of their tutors. The greatest care is taken of such. The difficulties which are not considered in books, the questions which can not be dealt with generally, the individualities of the finest minds, all render the work of the oral teacher of the highest importance, and constantly interesting to himself. The Oxford tutor is usually a highly accomplished scholar, who has himself passed through the university drill with thoroughness and success; he is young enough to enter into the feelings or even the sports of the youth he



BODLEIAN LIBRARY.

teaches, is their familiar friend, often entertained by them at their special social gatherings, and entertaining them in return. His care of his pupil is not limited to official hours, but is often special, and given with personal interest in every case where such interest is desired, or individual talent discerned.

It is obvious that where such is the general character of the teaching and learning, it can not be fully entered into by boys who go to Oxford for conventional reasons, whose ideal is the aristocratic idleness they have learned at home, and who can be stimulated to toil only by the ambition to become the chief oar of their college. To be incapable of literary enthusiasm is to be out of place at Oxford. Such youths are still school-boys, and their case is better met by colleges which assign lessons and hear recitations. At Oxford, where every young man, so far as he is attended to at all, is treated as one absorbed in the pursuit of learning, the career of many a youth brings such disappointment to his friends as was lately expressed by a parent who wrote to the *Times* newspaper that his son had got from Oxford very expensively what he might have obtained cheaply had he been apprenticed to a Thames waterman. Any Oxford tutor might have added to that complaint that the careers of such youths at Oxford are equally expensive to the university; for they are generally given too much money to spend, and, having little to do but to spend it, they set the fashion of lavish outlay, and make the average expenditure of a student at Oxford still greater than it need be, even after recent reforms.

However, Oxford is only sharing universal tendencies, and to stand still would have to go backward. Were the colleges to unite in raising the standard of examinations for matriculation, now singularly far below those of the further examinations, and also admit none beneath a fair minimum average of age, they would probably find a full compensation for diminution of numbers in the more perfect culture secured in any and every special direction.

It appears to me that the very saddest fault of the English scholar in all varieties is his mimosa-like shrinking from his due part in leading the popular mind. The men of science, philosophers, essayists, of England are brilliant enough, but they pass their time in writing to and for each other, and magnificently teach the already taught. The steady secularization of Oxford, which has been going on for thirty years, has added some fibre to the rising generation of scholars, but it is still much needed that they shall shrink less from coming face to face with the common people, over whom their influence is rarely felt. The university men and the lower classes in England are almost as much detached from each other as if they spoke in different languages; and beyond this there is a painful impression left that the cause of this is that the head has said to the hand and the foot, "I need you not." If the tendencies to cheapness and inclusiveness at Oxford, uniting with its undenominational basis—on which is slowly building its more secular character—shall bring the thinkers and authors into the bracing air of public life, shall endow them with more sympathy with the people, none need mourn over the cost of it in mere self-culture. The suffering masses of England are not to be saved from their many hells by "sweetness and light" till they who dwell in those fine elements become public souls, and their thought—their life-blood—beat from every college as from a heart to transfuse every vein of the nation and supply health to the people.

"THE BINNACLE RIZ UP AND TORE ROUND."

KNOWARE.

WE was "a-sailing and a-sailing," as the song goes, in the three-master *Maria Jane*, of Salem—a-sailing to the Mediterranean Sea with a cargo of Western lard, to be b'iled down and bottled into olive-oil. I had some notions aboard with which I reckoned to take the Eyetalian folks down, and make a dollar or so, but about two weeks out we got catched in a storm. Didn't it blow some? You better believe it did! In less 'n five minnits the ship's boom stood on its beam ends, the topmast got slewed round and tangled in the rudder chains, the binnacle riz up and tore round, and the flying-jib was keelhauled three times to leeward; they double-reefed the transoms and unshipped the jibber-jib, goin' under water ninety feet, more or less, every time. Finally they let the boats down, and every body tumbled into 'em head fust, and tumbled out again putty everlastin' quick. I was orfully seasick, so I didn't know nothing under the canopy where we was, and I wasn't no great hand anyway to tell latitude and longitude the best of times. Anyway, I was kinder slopped ashore after a while onto a sandy beach: I knew, after a spell, it was an island, but then I only knowed it was dry land. All the rest was drownded; and if it was to be, it's jest as well, it appears to me; for if somebody else had come ashore and had undertook to write travils there too, mebbe we shouldn't have told jest the same story; 'tain't often two folks do see things alike, and then the papers would have took it up and jawed back and forth about it, and called names: there'd have been a dreadful stir made every where to find out which feller lied and which didn't, and all about both on 'em. I'd have seen more'n four different stories about where I was born and brought up, who married my great-grandfather, and how her fust husband's brother told a lie, so't was certain I oughter; and I dare say some folks would ha' had the cheek to say there wa'n't no sech island as Knoware down on any map; jest as if you could strain the Atlantic ocean through a colander and pick out all the islands, like flies outen a pan of milk.

I'm glad I was alone: 'twould have saved lots of trouble in the world if there hadn't never but one man wrote history: who cares if he did lie about them old times? 'twouldn't ha' hurt nobody: and there's lots of dusty, musty, ridic'lous rubbish folks quarrel about all their days, and snatch up into big li-

brary-rooms, and pay good money for, that wouldn't have never ben round if there'd ben just one man to tell about it, and when he died another had took it up right there, and fetched it along. However, mebbe there's a Providence in it; there is in most things. There's got to be somethin' for lazy folks to do, and they may jest as well fight over them old battles as get into new ones, to my way of thinkin'.

Well, to come back, there I was: and fust I knew, a man picked me up, bundled me over his shoulder, and in a wink I was put to bed, and dosed good with hot soup and sherry wine, and warmed up with a good fire blazin' away on the hearth. There was a woman settin' by the fire, and when she see I was comin' round she up and asked if I wanted any thing, in respectable English. That tickled me. I never could see the use of forrin tongues. I thanked her polite enough, and said I'd kinder like the mornin' paper. She stared, and hollered "John!"

Well, he come in, and 'twas the very feller who fetched me up out of the water. I knew him by his all-fired red hair. I suppose I'd oughter have got up and fell on his neck, or tumbled onto my knees and said somethin' hifalutin to him; but I was real stiff; so I said "Hullo."

He larfed right out.

"You're pretty lively, ain't ye?" he said, for all the world like a Dedham man: that sounded good. I come from Dedham myself. I'd ben in the tin trade, peddlin' on't round the country quite a spell before I took to tradin' in notions.

"You better b'lieve I'm lively," sez I. "But say, look here! I want the mornin' paper."

He larfed right out again.

"No such institootions here, Sir. Ain't permitted."

"Jeerusalem! no mornin' paper in a free country?"

"Thanks be to praise, this ain't a free country," sez he; "not by a long shot. We were all dead sick of liberty, free speech, and all that eagle-o'-freedom talk afore we come here and settled. No, *Sir!* We've got a real, old-fashioned, six-foot, big, smart, respectable, cut-your-head-off-in-a-wink king; a real fatherly despot, now I tell ye!"

"I should think so!" sez I. "No mornin' paper!"

"Not a paper. No report of all the dirt and wickedness in the country comin' in to disagree with your breakfast, and lie around for the children to read and find out how they do it. No big scandal skippin' about from lie to lie like a bee on a balm patch, makin' folks talk about things they hadn't never ought to think of, and the wicked ones smack their lips over their own sort o' stuff glorified, so to speak, in print. No advertisin' lies about cure-all medicines, and cloth that's jest give away. No railroad accidents to give you the thumps jest readin' of 'em, and scare your wife to death hearin' about 'em."

"And no politics?" I put in.

"Not a darned politic, as old Joe Bowers said; we don't have 'em here. I tell you, man, we've got a king, and we have to behave ourselves."

"Dear me! dear me! and don't you never hanker for the immortal institootions of your native land, the everlastin' freedom of a democratic gover'ment, the power of the ballot-box, the people's choice of them that makes the people's laws, the liberty of speech, the free eddoocation, the voluntary church system, the—"

He broke in quite sudden, jest as though he sort o' surmised I was quotin' Squire Smiles's Fourth-o'-July oration:

"Freedom! Sho! Freedom of every body to do what they've a mind to, to lie about every body else, to gamble and spekerlate with their own money and other people's; to fall in love with other folks's wives, and shoot them that makes love to their'n; power of a ballot-box where the most has their way, not the best; and the most are an awful bad lot in a free country, I tell ye, ef they ain't elsewheres, and they pick out their own sort to make laws to suit 'em. I've seen it work. What's liberty of speech and free press but license to say and print all sorts of vile things about folks in one day's paper and take 'em back in the next, when they've done the mischief? What's public eddoocation but puttin' a power to do evil into hands that don't know no better than to up an' do it? Starvin' their bodies to swell their poor miser'ble conceited brains; onfittin' of 'em to do real work that calls for thews and sinners; spilin' their stomachs till they can't eat decent vittles, and their stomachs take revenge on the exasperatin' brains, and they grind in an' out like a set o' cog-wheels, and grind each other to achin' bits. I swan! it makes me sweat to think on't."

"Oh, keep cool!" sez I, "and fetch me a drink."

"Well," sez he, passin' his hand acrost his face, as though to clear something away, "I did get consider'ble woke up, didn't I? You see, this island is settled by a parcel o' folks from America who sort o' mistrusted that th' eagle o' freedom was showin' crow feathers; so we set up here, and things are run in a little different shape from what they was there. As soon as you get spry, I'll take ye round."

"Well, whilst I do lie here, can't you give me somethin' to read? Time hangs heavy."

"What 'll you have?"

"Oh, a real rousin' sensation novel 'll do."

John grinned, an' said, "Are by law forbidden. There's a few fust-class stories by them fellers acrost the water, and now and then one in Ameriky, but there ain't no blood-an'-thunder printed or imported here, Sir."

"But how do the women folks stand that?"

"Bless your soul! we don't teach our women to read."

"You uncivilized lot!" sez I.

"Not much; it's accordin' to reason. You don't catch our people squabblin' about women's rights, and woman suffrage, and all sorts of trash and stuff; the women stay to home and take care of their houses after the old-fashioned way. We don't have no 'monotonous existence' here; if they're dull, why, they can slap the children when they're naughty, and hug 'em when they're good. We have real live boys and girls round, I tell ye; none o' them little memoir fellers that die out of pure goodness, nor no infant prodigies. The women don't have novels, nor poetry, nor sewin'-machines, nor newspapers, so they haven't got nerves to speak of, and their hands are kept out o' mischief."

I groaned inwardly to think of the superior female I'd left to Dedham, who 'ficiated

as my wife, and had neurology, speritooalism, somethin' on the brain, and hated men. She knows Latin an' German, and plays on the pianny to kill; but we buy our bread an' things to the bakery: she don't think rich vittles is good for the human system anyhow. I think lots of Cynthy Minervy's intellect an' smartness in that line. I'm willin' to support such a ornament to the sex. I don't stay to home much, and I don't think our Freddie 'll live long: he's got a spine in his back, and lung difficulty, and stomach trouble, though he was fetched up on what she calls "strict hygienic principles"—fed on bran bread, beans, turnips, raw apples, and sech like; soused into cold water every day of his life, winter an' summer; practiced in them gymnastic tricks till it made me crawly to see him throwed onto the chandelier an' left hangin' by one little hand, set on his head in the corner, hung up by one leg to the bed post, and lots of other things to strengthen his muscles that nigh about scared him—an' me too—to death. Cynthy Minervy means to take to lecturin' when he dies; she knows how; but ef he don't die a-doin' on't, she calculates to cure him by a winch and pulley riggin' attached to his bed, which goes by clock-work, and

bein' fastened to his hair and great toes, gently but firmly hauls at him all night, so's't he's as much as an inch taller in the mornin'. She expects to straighten his back out that way, but things don't always fadge in this world, specially inventions, and you see this pullin' pulls out the muscles putty thin, and, C. M. says, "destroys the capillary attraction of the coats of the stomach from extension and attenuation." (I guess that's it. I've said it over consider'ble often.) Freddie cries some under treatment, and then she detaches him, lays him over her knee, and "reverses the mag-

REVERSING THE MAGNETIC CURRENTS.

netic currents," as they say in Boston. Mother didn't call it that, but it amounts to the same thing in the end.

I think Freddie will die, though. Perhaps he'd better; it's quite a chore for him to live. And somehow I'm weak-minded about the little feller; seems as if he'd ought to be took in somebody's arms and blessed. Cynthy Minervy don't know how; but she's a very superior woman. I expect she will make an amazin' smart lecturer.

I don't really think she'll live long in my house; I ain't up to her lofty sphere, and she 'pears to be lookin' round for a spirit mate. She talks a good deal about a pardner of the soul, a congenial mind, and all that; so, knowin' her sort, I'm prepared and resigned for what's comin'. It 'll seem kinder comfortable to get back onto my own level again, I declare for't.

But I seem to be wanderin' away from the subject. John fetched me a novel, one o' Scott's—not Commentary Scott, but another man—and I don't know when I've relished a book so much: it was full as good as Jenison Dennett or Urbanus Bobb's great works. I larfed right out the fust thing when I woke up next day, a-thinkin' how that old Antiquary got come up with about his Roman camp.

I see by daylight that John's house was dreadful comfortable and pleasant: big rooms, with soft sofys and comfortable chairs all round, warm-lookin' carpets, open fire-places, bright picturs, and lots of flowers set about. There wa'n't no real reg'lar shut-up parlor; they jest used the hull house to live in. I b'lieve in askin' what you want to know: questions is cheap; but John wouldn't talk till after breakfast. He said he'd got to get strengthened up to talk to a Dedham man that sold tin.

Land! what a breakfast we had! "My wife knows how to cook," sez he; and I guess she did. There was four childern to the table, all girls, rosy as apples, and happy as clams at high tide. They talked and larfed and ate all they wanted—good things to eat, too: juicy beefsteak, mealy potatoes, splendid bread and butter, and the best of milk.

By-'n'-by John and I went to walk. His name was John Smith: every body in his street was named John Smith. In the next street they was all Peter Gray; in another, Sam Clark.

"Why, it must make orful confusion," sez I.

"Not at all," sez John. "It's the best of ways. We want to kill out scandal, ef so be we can; and you know women is women every where, and talk they will; but it makes it pecooliar hard to fix their talk on any one sinner when there's a hunderd or more of the same name; and the women don't have no other name to the end of the chapter. My wife 'll be Mrs. John Smith till she's a widder."

"But the childern?"

"Oh, they're numbered in every family just as they come."

"But the letters?"

"We don't have any. Nobody knows how to write here but the Public Secretary. We don't have foreign mails, and we all live right here. There's a few farmers round in the country, but the P.S. stands ready to write a note for any body; then he makes a copy of it, and posts it on the town pump for three weeks. You've no idee what a sight of trouble it saves: nobody gets in a passion and says what he can't get back; nobody writes letters that get twisted to mean two things; and there ain't no old squabbles laid up on paper to rake out and fetch in evidence some future time. We go in for peace here."

As we walked abroad I see a great many pleasant-lookin' houses, but no public buildin's.

THE TOWN PUMP LETTER POSTER.

"Where's your Insane Asylum?" sez I.

"Haven't got any."

"But what do you do with your crazy folks?"

"Hang 'em."

"For mercy's sakes! you must be kep' busy," sez I, real horrified with sech talk.

"My, no. You know, in the States, when any body does any thing real bad, they prove 'em by course of law to be insane; we think an ounce o' prevention is worth ten pound of cure, so we hang 'em before they do any thing. The idee ruther keeps folks in their senses, too. As for the women, what with no tea, no novels, no readin' or writin', they don't lose their minds, as they call 'em. If they up and have the hysterics, why, there's the sea; we jest pitch 'em in at a rope's end, and pull 'em out when they've got composed. It's a sure cure."

"And where's your hospital?"

"We don't need one. We haven't got a doctor around, Sir. People don't get sick much here. If they do, we nurse 'em up at home with herbs and things, and if they can't be cured, they die; we've all got to die some time, and we think it's easier to die off nateral like than be plagued to death with drugs and doctors."

By this time I was real thirsty, so I said I wanted a drink.

"All right; here's the town pump."

"Oh, I don't mean water; a julep or a sling would be about right."

"Can't have it," sez he, as positive as thunder; "no sech in this kingdom."

"Why, you gave me sherry yesterday."

"Out o' your own flask, and you see the bottom of that."

"But what do you do in sickness?"

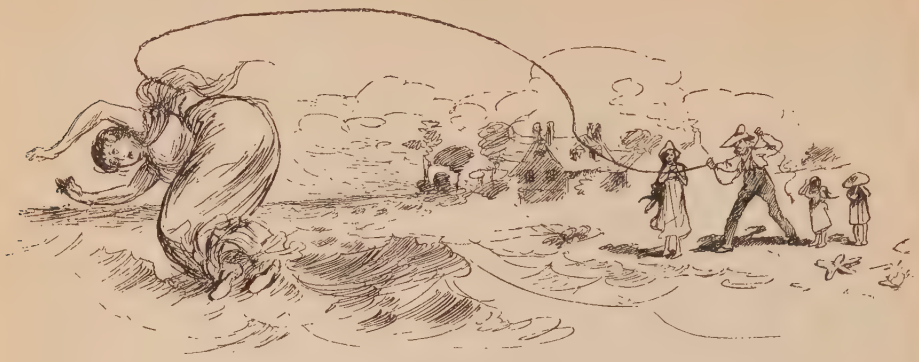
"Do without; our folks think it's a heap better to die of a decent fever or a respectable cholery than to learn the taste of liquor and live to be drunkards."

"Why, how you do talk!" sez I. "Supposin', now, one of your own childern was took sick, and you see 'em dyin' for want of a little stimulatin'?"

"They won't do it; besides, I'd ruther have 'em die of any thing than the tremens."

I see 'twa'n't no use to argue with him. When a man is sot on a thing, words is no use; so I took a drink of water and went along. The streets were clean as a new pin, and mortal still, though you could hear little folks laughin' and cacklin' in the cool gardens and pleasant housen by the side of the way.

"Where air your public schools?" sez I.



"Here," sez he, stoppin' before a long low house, like a shed some, that seemed to be fixed up with rows o' hogsheads, among which several men was steppin' round and talkin' out loud, one at a time; "there's the school."

"But I don't see no childern."

"No; you can't see through a millstone

TREATMENT OF INSANITY.

CURE FOR HYSTERICS.

no more'n the next man. We head up the boys at six year old in big barrels, and feed an' eddoocate 'em through the bung-hole till the age of twenty. They're extension barrels, so's't the boys can grow."

I *was* took aback. I was kinder riled. "What!" sez I, "all your boys in barrels! None o' them things folks lay sech stress on in teachers' conventions—no home influences, no manly sports, no everlastin' friendships, no Sunday-schools, no—" Here I sort o' give in; breath seemed to peter out. But he took up the talk:

"No, Sir! Cats and pigs and chickens live out all their days in peace here; nobody's a tyrant over mother and the girls from dawn to dark; no broken bones nor cracked skulls. Our boys don't never get drownded, blowed up with powder, tangled up in burr saws, split with hatchets, spilled off'n horses, run over in the streets, nor jammed to bits under fire-engines. We don't have boys swearin' and spittin' on every street corner; strainin' their backs a-boat-racin' and their tempers bettin'; no colleges to upset their manners and morals, and let 'em herd together like swine, and then turnin' of 'em loose on a world lyin' in wickedness, as our old parson used to call it. Nobody here's killed at base-ball, nor mangled nuther. Marbles, peanuts, and fire-crackers never pester us. We have peace."

"How delightful!" sez I, kinder involuntary.

"More'n all that, we don't never have no divorces. Them boys come out at twenty year old so orful meek and pleasant and grateful, their wives don't have no trouble with 'em at all."

"Good gracious, Smith, you don't give in to petticoat gov'ment here, do ye?"

"Well, why not? The women want somethin' to do to make 'em feel mighty; why

THE PUBLIC SCHOOL.

shouldn't they govern the men? It pleases them an' don't hurt us."

"But it's degradin' to a man. Never, Sir, would I put up with that. I will be master, I tell ye, in my own house. I will be minded, right off, in the fam'ly. Man is the nateral head of all things, and must be give up to."

I said this real fierce, and John give me the queerest look you ever see. Ef I ain't mistook he actooally winked at me. What could he mean? He patted my shoulder sorter friendly, and said,

"There! there! I know how 'tis with ye. You no need to demonstrate here; we're all used to it; it's a matter of course, as you might say. Don't say no more; I understand."

I declare for't, I scurce could guess what he *was* up to; but he went on:

"Girls, you see, don't need no schoolin'. They don't learn nothin' but house-work, sewin', takin' care of childern and sick folks, singin', and fussin' in the garden; their mas teach 'em all that."

"But where's your jail? your prison? your court-house?"

"Nowhere, thanks be to praise! If a man kills any body, we give him a spade and a bag of potatoes, and take and row him off to a desolate island, and leave him there to farm it. I tell ye, he puts to and digs! But farmin' for a livin' is capital punishment wuss'n hangin', a long sight—a real state of sin an' misery."

"I hope you've got plenty of islands," sez I, kinder sneerin'.

"Plenty for that puppus, Sir. There ain't no great of murderin' done here, for we don't allow no fire-arms of no kind around in this place."

"No guns nor pistols? How in the world do you shoot mad dogs?"

"We don't have no dogs, so there ain't no mad ones."

"No dogs! Why, don't ye know they're the faithful friend of man, as the readin'-book sez?"

"We know they bite folks and make 'em die in torters, ravin' mad. That ain't our kind of faithful friends. Besides, we have fust-rate mutton here, and that's better'n hydrophoby."

Dear me! what a cuss-tomer this feller was! He met ye at every turn jest as pat! 'Twas exasperatin'; so sez I, "Where's the bank?"

"Haw! haw!" laughed John. "That's Yankee all over. Money, Sir, the Scripter sez, is the root of all evil—"

"It don't say that, now I tell ye!" I put in, direct, glad enough to trump his trick.

"Well, it doos in my Bible."

"What 'll you bet?"

"Bet! there ain't no bettin' permitted here. I should be set to pumpin' at the town pump three hours a day for three weeks if I should bet you a peanut."

"Well! well! well! I won't stick to it; but I tell ye what Scripter *doos* say: 'The *love* o' money's the root of all evil!'"

"Oh, pshaw! what's the differ'nce? Well, we think the love on't can't be without the critter itself: so we don't have no money; therefore no banks, no notes, no checks, nor renewals, nor interest, nor nothin'."

"But how do ye buy things?"

"We change round, jest as folks used to before money was made: 'tain't always a close fit, but it's better'n all the wear an' tear of bills and credit, defaultin' and embezzlin'. I tell ye it comes hard for a feller to embezzle sheep and cows and sech: they won't pocket."

"But supposin', as you say, things don't fit? say you want suthin t'other man's got, and he don't hanker after what you've got: how about that?"

"Oh, I can go without, I guess; food an' clothin' we always manage to have a

"WUSS'N HANGIN', A LONG SIGHT."

"THE PRESIDING WIDDER SETTLES THE MATTER."

plenty; we live right along, an' don't worry about the futur'. Jest you notice the folks in the street; do they look like Dedham folks? Not much."

Sure enough they didn't. The men was easy-goin', pleasant, smilin', broad-shouldered fellers as ever you see; and the women—gracious! they was as rosy and fair-complected as a posy bed, and straighter'n bean poles; but dressed dreadful queer.

"You don't pan out no great on clothes here, do ye?" sez I, kind of smilin' like.

"Well," sez he, "we have enough to keep good and warm, and we call 'em good-lookin'."

I must own the women folks looked sort of slimpsy: folks was wearin' hoops when I left Dedham—all but Cynthy Minervy, and she had on a Bloomer rig. 'Twas handy; I don't deny but what 'twas handy; but it did look mortal curious. But she said "the needs of hygienic science, and the true nurture of the physical, demand freedom of the osseous structure and bounding space for vital pulsation, lest the divine Me be incarcerated in effete human bonds." I guess that's it; it's quite a spell sence I've seen Cynthy; she's found liberty, and I don't follow her round a sight. Well, the women here did look consider'ble like statooary females, but I didn't say so, an' he went on:

"No fashions here, Sir, I tell ye. Them kind o' gowns was ordered to begin with, and kep' right along; they can have 'em any color they're a mind to, and they can wear any kind of flowers and leaves that grow in their hair or their bunnets, and some of 'em do fix up amazing smart, now I tell ye."

"Law, yes. I know the kind; there is some women has it hard; they'll begin to prink and smirk and fix up like lightnin' from the time they're three year old till they die, even if they be old maids."

"That's another blessing in disguise we dispense with in this country," said John, a-larfin'.

"No old maids? do tell! Why, how do ye prevent it?"

"Why, it's thought best, for the sake of peace, that every body should be married; so folks keep an eye out, and when one man sees a young feller that's suitable like for his girl to marry, he goes and talks to his folks about it, private. If they're willin', he goes an' tells the king; if they ain't willin', why, that's the end on't; but if they be, the king he jest sends his head man to tell that young feller he ain't on no account to marry that particular girl; he can make love to any body else he's a mind to, but that girl is forbid. Then the head man he goes to the girl's mother an' says he's heerd that girl is makin' eyes at that young man, and the king don't approve of it, so she'd better be looking elsewheres. It's reckoning on natur', you see: there's lots of human natur' in every body. Why, the very minnit them two young folks hear how that they ain't on no account to have nothin' to do with each other, they pitch right in. I never know'd it to fail, not one time. And then, when they're ready to tie the knot, some of their pas or mas that's up to time advises of 'em to petition the king, and after a spell he gives in and they're married. Ain't that 'cute?"

"It doos beat all. But how do you come out even, I'd like to know?"

"Oh, there's mostly a chance for every

body, what with widowers; if there is any surplus, why, we colonize 'em on Garden Island, and set 'em to raising small fruits and poultry. That keeps them busy, you see; there ain't any men folks to quarrel about, nobody else's affairs to gossip over; and if a man happens to want a wife, why, he can go over there, if he gets a permit, and look about him, and the presiding widder settles the matter."

"Well! well! well! I never did see sech a place; no strong-minded females, no littery women, no votin', no log-rollin', no lobbyin'! But look a-here, how did ye start your king? It's as great a wonderment to me how they start kings as how they start yeast."

"Why, you see, there wa'n't but about thirty of us at first, all picked men and friends; and we didn't any of us want to run the thing—we was dead tired of bein' sovereign people; so we looked round a spell, here and there, and finally hit on a real smart, honest, capable fellow, with a good healthy wife, and made him an offer, and he took it up. We swore to hold him up, and have his childern come after him, and we give him power enough to keep folks straight. After we got runnin', why, some of us fixed up a ship and went back for a few more picked hands; perhaps we fetched away, take 'em big and little, fust an' last, a couple o' hunderd: we've lived here twenty year now; nobody's ben this way before you; we're out o' the tracks entirely, and we're well off and happy. I tell you, this is livin'."

"But where's your meetin'-house?"

He turned round a sharp corner, and we come to a large low house without any steeple, opened a door, and stepped right in: it was a real big room, with pleasant red carpets and kind of cream-colored walls, easy cushioned chairs standin' thick on the floor, and a kind of a readin'-desk behind a long table that had a dark red cloth on it, and some low wide white vases onto each end, fairly drippin' with flowers. There was little recesses betwixt the windows, with curtains to 'em, here and there drawed together.

"Them is for folks that want to come here daytimes and say their prayers. It's private like and still, you see, in them little alcoves, and we never keep the doors locked."

All the wall was hung with pictures; I couldn't begin to tell 'em all; but the house was bright and pleasant and sweet and warm beyond any thing I ever see. Seemed jest as if it was home. I could ha' set there all day.

"Got a good preacher?" sez I.

"We don't have preachin'. Our minister he jest reads the Bible, whatever part he thinks best; then we have singin'—every body sings—and he prays once or twice."

"Well, if he's like some folks to home, he'll do more preachin' in one prayer than 'll last ye a week. My! I've heerd Parson Styles tell the Lord as much about other folks and the 'fairs of the nation as though He was a perfect stranger to 'em."

"We don't have no sech prayin' here, for we have prayers out of a book, the best out of all the good old books, and a good many right out of the Bible. Once in a great while he reads a sermon out of somebody's printed ones, but not very frequent."

"What on airth does he do week-days?"

"Why, he goes round visitin' folks, talkin' to 'em friendly, and tryin' to straighten 'em out, or seein' to the sick. We all see he don't want for clothes and food for his family, and so that's off his mind."

"This is a curious place enough," sez I. "But I'm fairly hungry with so many idees pourin' in on me. Ain't there a place round here where you can get things to eat?"

"Yes, the bakery's over in the square."

So we come around a ways, and got to a real clean, light store in a big white buildin'. There was two or three small tables near to the windows, and as we set down a nice waiter-boy come up to 'tend to us.

"What will you have?" sez John.

"Well, a piece o' pie and cheese, I guess," sez I.

"*Pie!*" hollered John.

PAROCHIAL BUSINESS.

"PIE!" shrieked the waiter-boy.

They couldn't have looked more thunderstruck if I'd asked for prussic acid or a drink of strychnine tincture.

"Well," sez I, strivin' to speak calm, "what's to pay now? I said pie."

"Why, it's a penal offense to make a pie in this country, and a hangin' matter to eat it," sez John, in real sober earnest.

"Thunder!" sez I; "what's that for?"

"Oh, my deluded friend, don't you know that pie is at the bottom of our former country's demoralization? Don't you know that pie was the germ of the Revolution, the instigator of the war of 1812, the inspirer of the rebellion? Don't you know that pie is a concretion of 'riginal sin and actual transgression? that pie and prison are cause and effect? that this seductive but fatal viand has destroyed the American stomach and disintegrated the American brain, till the whole country is a mass of political corruption and moral decay? Don't you know pie is—"

"Oh, stop! do stop!" sez I. "I've eat pie sence I was born, and I ain't a jail-bird or a fool yet."

"But jest think what you might have been on better and hullsomer food: you might have been a Solon, an Aristides, a Homer, a George Washington."

"I'd a sight ruther be a tin peddler. Do drop pie, and give me somethin' to eat, if you've got any thing short o' corn fodder; I can't stomach that."

Well, they fetched in bread—fresh bread, jest as white and light and sweet as you want to see, a pat o' butter hard and yeller as wax, a big glass pitcher of cream, a dish of white strawberries, a basket of red cherries, and a comb of honey clear as water. I ain't goin' to go back on pie—I'd jest as soon think of sassing my grandmother—but I tell *you*, a dish of white strawberries, with a leetle mite of clover honey jest trickled round amongst 'em, and thick cream poured clean up to the top of the saucer, and sech bread crumbled in, comes putty near to bein' good eatin'.

John laughed to see me pile in.

"'Most as good as pie?" sez he.

"Pretty near," sez I, betwixt the mouthfuls.

Well, Sir, I can't have no time nor room to say more, for I ain't one that holds the pen of a ready writer—it comes hard. But ef I was to take time, I could tell vollums about that country. I had to come away, for I had settlin' up to do in Dedham; but it's my purpose to go back, wind an' weather permittin', some time or 'nother. Cynthy Minervy's gone out to Illinois for a

spell. Dedham folks do say there's ben a speritooal here lecturin', who seemed to be round consider'ble, 'long of her; and Parson Styles kinder hinted to me 't I'd better foller her up, for she sort o' let on to him that I'd up and left her, and 'twas good cause for divorce; and Illinois, ye know! But I said, sez I, "Let her went, parson. Ef Cynthy Minervy's tired o' me, why, I ain't the man to hender her bein' happy her own fashion. I sha'n't never interfere; and I'll take Freddie 'long o' me." The parson said I was a remarkable generous man, a self-denyin' feller as ever was. Parsons don't know every thing. But ef Cynthy Minervy doos git a divorce, as sure as guns I shall put for Knoware as quick as I can charter a fishin' smack.

I see I've all along dropped into Dedham kind o' talk; it come so nateral, I suppose. I've ben and traded off my Unabridged for a copper tea-kettle and Tupper's Proverbs, so that I haven't had no help about words; but then that book of Ph'losophy doos beat all, and Dedham water is death on tin kettles. And when all's said and done, them words is the best that tells what you mean to say the easiest, short bein' better than long, jest as quick blows is better'n slow ones.

Ef any body 'd like to go to Knoware along o' me, passage and outfits can be obtained at the lowest prices, very reasonable, by applyin' right off to

Mass.

AFTER DARK.

When Twilight gathers in her sheaves,
And wheeling swallows skim the flume,
The ploughman, turning homeward, leaves
His plough mid-furrow in the broom,
And through the melancholy eves
The orange drops its milk-white bloom.

The old delights that go and come
Through sorrow, in the falling dew,
Like waves that wore a wreath of foam
The darker that the waters grew,
Flow round my solitary home
At evening, when the stars are few.

So, sad and sweet as bridal tears
For broken homes, to see withdraw
The child we love, have gone the years
We climbed the frosty hills, and saw
Descend on all the frozen meres
The sunlight breaking through the thaw.

Like one who in the driving snow,
When all the untrodden paths are dim,
Hears far-off voices, faint and low,
Across the woodland calling him,
I hear the loved of long ago
Singing among the seraphim.

And as the soft, dissembling light
Falls, shadowing into dusky red,
I think how beautiful the night
With gathering stars is overspread,
Like seeds of many an old delight
Through sheaves of sorrow harvested.

LOUIS CHETLAIN.

THE RED RIVER COLONY.

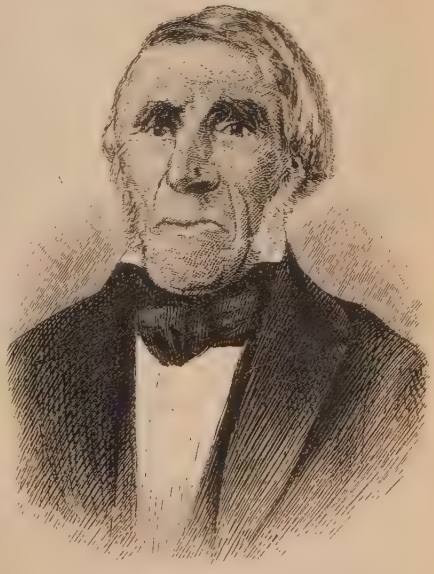
THE exhaustion of material forces by the Napoleonic wars, which at their close at Waterloo had enfeebled almost to the last gasp all the powers that had been engaged in them, had effects equally powerful upon the social conditions of Europe. In this last phase, indeed, the most deplorable results are seen. The populations which had been reduced by losses in battle and by disease were disheartened, disorganized, impoverished. Successful business enterprises, public and private, which alone can restore confidence and happiness in such a conjuncture, were impossible and unattempted. Manufacturing industries at first languished, then ceased to exist. To crown all these miseries, the untimely and excessive rains in the summer of 1816 had so damaged the crops that a general famine was apprehended. The expense and difficulty of transportation enhanced the cost of all necessaries of life. The price of grain rose to an unprecedented height, and the poorer classes suffered for the want of bread. In Switzerland the distress was greater than in any other part of Central Europe, and the people, wearied of struggles which resulted in their own impoverishment, listened eagerly to the story of a peaceful and more prosperous country beyond the sea.

A few years earlier Thomas Dundas, Earl of Selkirk, a distinguished Scotch nobleman of great wealth, had purchased from the Hudson Bay Company a large tract of land in British America, extending from

the Lake of the Woods and the Winnipeg River westward for nearly 200 miles, and from Lakes Winnipeg and Manitoba to the United States boundary, part of which tract is now embraced in the province of Manitoba, and in which are the fertile lands bordering on the Red and Assiniboine rivers. It formed a part of "Rupert Land," named in honor of Prince Rupert, or Robert, of Bavaria, a cousin of King Charles II. of England, and one of the founders and chief managers of the Hudson Bay Company. Rupert Land was somewhat indefinite in extent, embracing all that portion of British America that poured its waters into Hudson Bay, and was drained chiefly by the Great Whale, Rupert, Abbitibbe, Albany, Severn, Winnipeg, Red, Assiniboine, Saskatchewan, and Churchill rivers. In extent it was almost equal to the United States prior to its accessions after the close of the Mexican war. It was the original purpose of Lord Selkirk to settle these lands with colonists from Scotland. In the year 1811 he had succeeded in planting a large colony of Presbyterians from the north of Scotland on the Red River, near its junction with the Assiniboine. This was followed, four years later, by another but smaller colony from the same section of Scotland. In consequence of the stubborn competition and the bitter dissensions between the Hudson Bay Company and the Northwest Company of Montreal, these colonists were compelled to abandon their new homes, nearly all of them removing to Lower Canada, where they believed they could live in greater peace and security.

Lord Selkirk entertained great admiration for the character of the Swiss, and having failed in his emigration schemes with his own countrymen, turned his attention to Switzerland. He prepared and caused to be published in the French and German languages a pamphlet giving a full but somewhat exaggerated description of the new country, its climate, soil, and productions, and offered to all heads of families, or those who were unmarried and over twenty-one years of age, land free of cost, with seeds, cattle, and farming implements, all on a credit of three years. It was the policy of the British government to favor these emigration schemes, the statesmen of that day believing that the region in question could successfully be colonized and settled by way of the north route, viz., Hudson Bay, Nelson River, and Lake Winnipeg. The pamphlet alluded to was freely distributed by Lord Selkirk's agents in the French-speaking cantons of Neuchâtel, Vaud, and Geneva, and in the German-speaking canton of Berne. Many young and middle-aged men in those cantons, having become weary of the condition of affairs at home, decided to emigrate to British America under the auspices of Lord Selkirk, and formed a colony for that purpose. It was agreed to set out for America in the spring of 1821. The colony numbered over 200 persons, nearly three-fourths of whom were of French origin and speaking that language. They were Protestants in faith, and belonged to the Reformed Lutheran Church. Some of the families were descendants of the Huguenots of Eastern France; all were healthy, robust, and well fitted for the labor and privations incident to a life in a new country; most of them were liberally educated and possessed of considerable means. Among the more prominent heads of families were Monier and Rindesbacher (the seniors of the colony in age,

MAP OF HUDSON BAY AND THE TERRITORY WESTWARD.



PHILIP SCHIRMER.

and men of culture and of influence in their respective localities), Dr. Ostertag, Chetlain, and Descombes; and of the unmarried, Schirmer (afterward for a score of years the leading jeweller at Galena, Illinois), Quinche, and Langet. In the families there were, as it happened, but few children under twelve years of age, except infants in arms.

In the month of May, 1821, the preliminaries having been completed, the colonists assembled at a small village on the Rhine near Basle. Why they did not rendezvous at Basle—a city of considerable commercial importance—seems a little strange. The impression afterward prevailed among the colonists that the managers feared to take them to a large city, lest some unfavorable facts connected with the country to which they were going might come to light, especially the important circumstance that Lord Selkirk had failed to settle the country with his own countrymen. Be this as it may, two large flat-boats or barges were provided for their use at the rendezvous, and in these they floated down the Rhine, with its numerous cities and villages and its vine-clad hills and ruined castles on either hand. But with hearts elate with hope, and their imaginations filled with visions of a distant land, it may be doubted if the storied scenes of that beautiful river received from these hardy adventurers more than a passing thought. At the end of ten days they reached a small village near Rotterdam, where a stanch ship, the *Lord Wellington*, was in readiness to take them to the New World.

After setting sail their course lay north of Great Britain and just south of Greenland to Hudson Strait. Soon after their departure from Holland it was found that the quality of the food issued was greatly inferior to that promised them before their departure from Switzerland, and complaint was made to the captain of the ship—a stern but kind-hearted old seaman, who acknowledged the wrong, but claimed that he was not responsible for it, which was no doubt true. The water also was bad, and issued in insufficient quantities. Arriving at Hudson Strait, latitude 62° north, the *Lord Wellington* overtook two English ships bound for Fort York, or York Factory, situated at the mouth of the Nelson River, laden with Indian goods and supplies for the garrisons at Forts York and Douglas, and for the employés of the Hudson Bay Company. The strait was filled with floes and bergs of ice, and the ships were thereby detained over three weeks. One of the supply ships was seriously damaged and nearly lost by collision with an iceberg. Finally, with much difficulty and no little peril, Hudson Bay was entered, and after a long and tedious voyage of nearly four months they landed at Fort York. The colonists were at once embarked in bateaux, and commenced the ascent of the Nelson River. Propelling their heavy-laden boats by rowing, often against a strong current, at the end of twenty days Lake Winnipeg was reached, and here new troubles awaited them. The season was advanced, the fall storms had set in, and their progress along the west shore of the lake, 260 miles in length, was slow and laborious. After a day's hard rowing, often against head-winds,

PETER RINDESBACHER.

THE VOYAGEURS IN CAMP.

the little fleet of boats would put into some sheltered spot, where the weary voyageurs, perhaps drenched with rain or benumbed with cold, would kindle fires, and all be made as comfortable as possible for the night. In addition to these discouragements and discomforts, their supply of provisions gave out, and the few fish they were able to catch were barely sufficient to keep them from starving. At the end of three weeks, much time having been lost by reason of high winds and storms, they arrived, half famished, at the mouth of the Red River, where to their dismay they learned that the locusts or grasshoppers had passed through the country the summer before, literally destroying all the crops. With heavy hearts they proceeded up the river some thirty-five miles to Fort Douglas, situated on the west bank of the river, near the site of the present Fort Garry, then the principal trading post and head-quarters of the Hudson Bay Company. Governor Alexander M'Dowell and the other officers of the company, by their cordial welcome and earnest efforts to supply their wants and

make them comfortable, not only gladdened their hearts, but did much to make them forget the hardships of their long voyage.

It is worthy of note, in passing, that a few months before their arrival the Hudson Bay Company and the Northwest Company had settled their long-standing difficulties amicably, and merged their interests in a new corporation, retaining the name of the former company. Governor M'Dowell could not promise the colonists sufficient provisions to carry them through the approaching winter, for it was evident that the supplies received from England would be inadequate for the wants of all. After a full deliberation upon a question scarcely less momentous than that of life or death, it was resolved to send some seventy-five of the younger and more hardy of the colonists to Pembina, up the river, near the United States boundary, sixty miles distant, where it was believed the buffalo, elk, and deer were more abundant, and where jerked buffalo meat and pemmican could be obtained from the Indians of that locality. Just as the winter closed in, the party arrived at Pembina, and at once set about constructing huts and procuring fuel for the winter.

The succeeding winter was long and intensely cold, the thermometer often falling to forty-five degrees below zero, and the snow unusually deep. The colonists wintering at Pembina fared badly enough. With the advance of winter the scanty supply of provisions brought from Fort Douglas diminished rapidly, and, when exhausted, the fish, obtained with difficulty from the river through holes cut in the ice, with what buffalo meat could be bought from the Indians, was scarcely sufficient to prevent starvation. Sometimes an Indian dog was killed and eaten, and relished by most of them. The parties who occasionally ventured out with dogs and sledges obtained from the Indians to hunt for the buffalo, met with indifferent success, owing to the scarcity of the animals that winter, and lack of experience. Several of them were maimed for life by the freezing of their hands and feet. In the spring, after the snow had disappeared, the women would gather acorns and the seed-balls of the wild-rose bush that grew rank on the margin of the river, which, when cooked with a little buffalo fat, made nutritious if not palatable food, and served to relieve the hardship and monotony of the almost exclusively fish diet of the preceding winter.

Five years prior to the advent of the Swiss colony the employés of the Northwest Company, in their bitter opposition to Lord Selkirk's scheme to colonize that country with Europeans, openly resisted the settlers, and went so far as to make an armed attack on a settlement of Scotchmen near Fort Douglas, killing some twenty of them, including Governor Robert Semple, who had received his appointment as Governor of Hudson Bay Company five years previous. Lord Selkirk, on learning of the massacre, left England at once for Canada. There he obtained from the authorities a hundred or more soldiers from the "Régiment des Meurons," and a few volunteers.

FORT GARRY.

Placing himself at their head, he proceeded to the Red River Settlement, where, after seizing several of their trading posts, he restored peace and tranquillity. Two years after, the troops brought from Canada were discharged, and the greater part of them were induced by Lord Selkirk to settle in

ARMED ESCORT.

that country. Land was donated them near Fort Douglas, and cattle and other supplies furnished them on a long credit. Fortune favored these settlers, and at the time of the arrival of the Swiss colony they were generally well-to-do farmers; and had it not been for the ravages of the grasshoppers the summer before, the crops of these farmers would have furnished ample food for the new-comers during their first year's stay. These Canadian settlers, or "mennons," as they were called, were all unmarried, except a few who had taken Indian or half-breed wives. Among the colonists were several families in which were marriageable daughters, and it was natural that offers of marriage should be made by the bachelor farmers. During the winter several such marriages were consummated. The colonists, although disappointed and almost starving, were nevertheless cheerful, and disposed to make the most of the unfortunate circumstances in which they found themselves. It was deemed necessary to celebrate the nuptials in a becoming manner, and to do honor to the occasion a party would be given, to which the relatives and friends were bidden. Wedding cake was made of coarse flour obtained from wheat ground in the ordinary rotary coffee-mill, to which were added a little buffalo fat and salt. There was also the music of the violin, and the feet of the dancers kept time to the airs of Switzerland.

The health of all the colonists that winter was good, despite the severity of the winter and the insufficiency of food. The opening of spring found them ready to enter on the lands allotted them at "La Fourche," at the junction of the Red and Assiniboine rivers, and soon after the 1st of May the entire colony was again united. Lord Selkirk had died at Pau, France, the autumn before their departure from Switzerland, but the fact had been withheld from them until after their arrival at Fort Douglas. Consequently no provision had been made to supply them with seeds and farming implements, as promised them before their departure from the Old World. They were therefore compelled, with few exceptions, to use the ordinary hoe and spade in turning over the sod and in preparing the soil for planting and sowing the seeds obtained in limited quantities from the Canadian farmers. However, as the result of a hard summer's work, the women assisting the men, and the soil being remarkably productive, the crops raised, with what they obtained from the older settlers, carried them through the succeeding winter comfortably.

Early in the fall of 1821 a herd of cattle, mostly cows, arrived from the State of Missouri, in charge of a party of armed drovers, and were distributed in the spring of 1822 among the Swiss settlers. This distribution of cattle, which had been contracted for by Lord Selkirk before his death, was all

ON GUARD.—[SEE PAGE 54.]

that had been done for the colonists in fulfillment of the pledges made them before their departure from Europe. As a consequence dissatisfaction became general, and a determination was made by a large part of the colonists to depart, the first practicable moment, for the United States—a country of which they had learned much since their arrival at the Red River. On the return of the drovers in the autumn of 1821, five families begged permission to accompany them, which was granted. In the month of November the party arrived in safety at Fort St. Anthony (subsequently Fort Snelling), situated at the junction of the Mississippi and St. Peter's rivers, then in process of construction, and garrisoned by United States troops in command of Colonel Josiah Snelling of the Fifth United States Infantry. With the consent of the commanding officer, the party of emigrants remained at the fort during the succeeding winter. The next spring they settled on the military reservation near the fort, cultivated land, and sold the products to the garrison.

In the spring of 1823 thirteen more of the colonists, with their families, decided to go to the United States, with the intention of settling in the State of Missouri, of which section of the Union they had heard glowing descriptions from the party of drovers two years before. They hired some half dozen carts—all that could be obtained in the settlement—to carry their ef-

fects to the head waters of the St. Peter's (now the Minnesota) River at Lake Traverse, some 200 miles above Fort St. Anthony by the course of the river. These carts were constructed without iron, the tires being of rawhide drawn tightly around the wheel. They are still known as the Red River cart, and until the opening of the North Pacific Railroad were frequently seen at St. Paul. The Sioux Indians found on their route after entering the United States were unfriendly, if not openly hostile, and the little company were often in considerable peril. By judicious management, however, understanding as they well did the character of the Indian, they escaped open conflict. The chiefs of the roving bands encountered were generally appeased, and their apparent good-will gained by presents of ammunition, food, and trinkets. Before the end of their journey, however, the Indians succeeded in stealing a part of their cooking utensils and provisions. The inadequate number of carts, heavily laden as they were with their effects, prevented any except the older children from riding, and often a mother would walk twenty miles in a day with a babe in her arms. The men were all armed, and acted as an escort to the train. After a long and at times perilous journey of 400 miles, they reached Lake Traverse, and went into camp, the carts returning with the men to whom they belonged. Preparations were at once begun to descend the St. Peter's River. Cottonwood-trees were felled, and canoes or "dug-outs" were made, one for every two adults of the party. The work was slow and difficult for the want of proper tools. Being in a country through which roamed hunting parties of unfriendly and thieving Indians, it was necessary to keep a guard over the camp at night. That duty devolved on the women, for the men needed the sleep of night in order to be able to work by day on the canoes. An old lady, now in her seventy-ninth year, and the only surviving member of the colony, who was twenty years of age or more at the time of the departure of the colony from Switzerland, told the writer not long since, with evident pride, that she had more than once stood guard over that little camp, armed with a gun, from nine o'clock at night until sunrise the next morning. The canoes having been finished, the party launched them, and heading them down the stream, floated with the current the greater part of the time. The river, as is usual at that season of the year, was low, and some portions of it filled with shoals and sand-bars, over which they were often compelled to drag their heavy-laden crafts.

About the middle of the month of September they arrived at Fort St. Anthony, and were kindly received by the officers of the garrison, and warmly welcomed by their countrymen who had preceded them two years before. After a few weeks' rest they prepared to descend the Mississippi River to St. Louis, their destination. Two small barges or keel boats which had been used to transport supplies from St. Louis for the use of the troops were generously placed at their disposal by Colonel Snelling (who also supplied them with provisions for the voyage), and in these they leisurely floated down the river, meeting with little or no difficulty. The exposure and hardships of the summer and early fall brought on chills and fevers and other malarial diseases. Mr. Monier, the senior of the party in age, fell sick and died, and was buried near Prairie du Chien, and soon after his eldest daughter followed him. Before reaching Rock Island, Mr. Chetlain became delirious with fever, and it was decided to leave him with his wife and child at Fort Armstrong, where he was placed in the post hospital, and cared for with kindness and skill. The rest proceeded on their way, reaching St. Louis late in the month of November. Mr. Chetlain and family joined them the next spring.

On the arrival of the emigrants at St. Louis, then a city of 6000 inhabitants, they were welcomed and hospitably treated by the Chouteaus, Soulards, and Gratiots (the latter of Franco-Swiss origin), and other French-speaking citizens, who had become familiar with their peculiar history. The greater part of the emigrants leased lands near the city and cultivated them. They proved industrious, temperate, and thrifty citizens. The climate of that region, however, was evidently unfavorable for them, and the larger part fell sick. The process of acclimatization was slow and difficult, and by the end of the second summer most of them decided to remove to a cooler and more healthful climate. The opening of the lead mines of the Northwest gave the wished-for opportunity. Mr. Chetlain and a few others, with their families, joined Colonel Henry Gratiot, the newly appointed agent for the Winnebago Indians, and took passage on the steamboat *Mexico*, one of the first boats that ascended the Mississippi above the mouth of the Illinois River, for La Pointe, on Fever River, where now stands the city of Galena, arriving there the 14th day of April, 1826. Some months later Messrs. Schirmer, Langet, and others followed. In the autumn of that year the greater part of them removed to the Indian agency at Gratiot's Grove, fifteen miles northeast from La Pointe, and engaged in mining and smelting lead ore and in farming.

The spring of 1826 was noted for the great rise of water in the Mississippi and its tributaries and in the Red and Assiniboine rivers, caused by the unusual deep snow of the preceding winter, which had melted with

warm and heavy rains. The Red and Assiniboine rivers rose so high that the lands at La Fourche were completely inundated, and the settlers compelled to seek safety by flight to higher ground several miles distant, taking with them their cattle and household effects. The losses sustained by the flood were very great, and no efforts were made to repair them. Nearly all the Swiss settlers remaining at La Fourche, including a part of the Canadian settlers, having become thoroughly discouraged, decided to leave at once for the United States. Abandoning their lands, and selling their cattle and farming implements for what they could, they hired carts to transport their effects and provisions, and started in a body for Fort St. Anthony, following the route taken by the first party, three years before, to Lake Traverse, and from thence by land to their destination, arriving there early in the autumn of that year. Governor M'Dowell and the other officers of the Hudson Bay Company deeply regretted their departure, and generously supplied them with provisions for the journey free of cost, an interpreter, and an armed escort of forty-five men. A few weeks after their arrival at Fort St. Anthony they were fortunate enough to find a small steamboat that had been used to transport supplies for the troops at that point, in which they took passage for the lead mines, to which place they decided to go after they had reached Fort St. Anthony. On their arrival at La Pointe they were warmly welcomed by their countrymen who had preceded them. Some of them settled at La Pointe, while the greater part went out to the agency at Gratiot's Grove, and engaged in mining and farming.

Six years later, when the Indian troubles began which culminated in a war known as the "Black Hawk war," and volunteers were called for, nearly all the men, without regard to age, enlisted, and having been accustomed to the use of fire-arms, rendered the country of their adoption valuable service.

The descendants of these colonists are numerous, and are found scattered throughout the Northwest, the greater part being in the region of the lead mines. Most of them are thrifty farmers and stock-breeders. A few have entered the professions and trade. All, as far as is known, are temperate, industrious, and law-abiding citizens.

URANIA.

From what superior star,
Gazing, entranced, afar,
Didst thou first look on earth when earth was young?
Thou whom the singers of all days have sung,
Spirit of Song! by many names adored,
Whose deep, sweet speech, the music of the soul,
Our human utterance can not yet control,
Upon whose dazzling shrine are ceaseless offerings poured.

When first thy sun-shod feet
Pressed the new verdure, sweet
With timid violet and virgin rose;
When first thy rainbow plumage passing by,
The shepherd bards discerned, ah! rapturously
They sought thy inspiration to disclose.
With burning heart and glances raised above,
Speech overflowed in song, and all their theme was love.

Nor didst thou linger long
In vales of pastoral song.
Judea's harp thy fervid fingers strung.
The groves of palm, the sacred rivers, heard,
The cedars upon Lebanon were stirred
When David's lips immortal measures sung.
And smoke of costliest odors rose to heaven
With chorus and response by Hebrew voices given.

On Orpheus' glowing lyre
Was laid thy touch of fire;
By thine own lips on Sappho's brow was pressed
The mystic kiss which woke her soul's unrest.
Unveiled by thee, in thy most radiant mood,
The palaces that on Olympus stood,
From whose charmed portals came, at thy decree,
The gods of earth and heaven, the nymphs of air and sea.

Then was the age of gold,
When bards heroic told
Heroic legends of primeval days.
Then had the singer his full meed of praise,
For thou didst touch the laurel with thy wand,
And prince and warrior with exultant hand
Wove the bright bays around the minstrel's name.
Their valor was his theme; his song their surest fame.

Yet not by these was seen
The splendor of thy mien,
The full, unclouded glory of thy face.
These caught but glimpses of the light divine,
And, counting thee among the "sacred nine,"
Groped in the darkness for thy dwelling-place.
Milton alone o'er elder bards prevailed;
Upon the starry heights he saw thy brow unveiled.

Dearer through ages grown,
Thou wilt not leave alone
The world thy presence has made half divine;
Still countless votaries bow before thy shrine.
The Norseman's ringing ballad, the soft chime
Of Spanish lute to silver sandaled rhyme,
The hymn of freedom by the sunset sea,
Or Persia's passion lays, all sacred are to thee.

Some are content to reach
The still, inaudible speech
Of winds and woods and waters' rhythmic flow.
These know thee best in nature's whispers low,
And with the hem of thy rich garment pressed
To tuneful lips, they are supremely blest.
Others have caught a more transcendent gleam,
And greet thee on the heights of prophecy and dream.

Stay, thou resplendent one!
Not yet thy task is done,
Not yet the perfect song of ages sung!
A rose unblown it sleeps upon thy breast,
Waiting to make some later Eden blest.
Still be the halo of thy beauty flung
Over dark days, dark years, until afar
Above the New Song's birth thou smilest like a star!

FELIX MENDELSSOHN-BARTHOLDY.

MENDELSSOHN AND MOSCHELES.

WHEN Ignatz Moscheles, the musician, was a very young man, studying in Vienna, he went one day to the house of old Salieri. Beethoven had just been there; and Moscheles found, written on a sheet of paper, the following words: "The pupil Beethoven has been here." Moscheles in his diary records this fact, and that it "set him thinking"—a Beethoven acknowledge he had yet to learn of a Salieri! And at the same time he adds, with the sudden touch of sadness and regret retrospection brings: "Ah, those were happy, busy days in dear old Vienna!"

This was in 1814–16. Moscheles, the son of an estimable merchant in Prague, had received a good musical education, and had gone to Vienna to promote his interests and acquire fresh knowledge and incentive. Beethoven was in Vienna in those days. Music, if not understood, was at least fashionable. The Viennese ladies, at their soirées, would smilingly perform the great master's works, while he sat, grim and silent, listening. Moscheles marvelled at their temerity. The story of the Vienna of that time is like a series of pictures toned, tinted by associations, names, figures, which reach us warm and life-like in hue. The spirit of Haydn and Glück coming to them from yesterday with some faint echo; an evening of social converse and music from the old-fashioned harpsichord instruments; pretty women, with powdered heads and jewelled fingers, and fans and frivolity; a genius like Beethoven—divinest impulses struggling with the narrow boundaries of its surroundings—sitting in judgment on the crude performances. The quaint pianos and violins tinkle out the wonderful music; the vibrations go on, impossible to silence, though the listeners fail to catch their meaning. Here and there we see a spirit like Moscheles drawing in strength for the future, divining in these faint interpretations the possibility of the great to-morrow in the musical universe. Meanwhile, in an uncertain sort of way, Moscheles composed at this

time quartettes, symphonies, variations, and his youthful ardor gained new stimulus every day. He was associated with Meyerbeer and Hummel at that time. Later he visited London and Paris, and formed his first English ties; but it was when the "happy, busy" days in Vienna were at an end that the friendship, later so celebrated, and from its outset so beautiful, began.

Moscheles had already acquired some fame when he visited Berlin in 1824. Literary and musical associations clustered about half a dozen centres in that city, with a slight affectation possibly, but much that was soundly artistic and genuine. The famous Frau Rahel von Hengen gave receptions; in one or two households fine musical instincts were developing; two young people, the son and daughter of M. Abram Mendelssohn-Bartholdy, attracted great attention from their marvellous musical genius. Zelter, the arrogant, wonderful master who guided so many impulses stirring in the Berlinese coterie, was their teacher, and Moscheles was speedily introduced to them. Felix, the boy, was fifteen; the girl, Fanny, was a few years his senior, her genius being scarcely less remarkable than her brother's, though he had composed quantities of music, had conducted an orchestra, and was now puzzling his young brain about the best theme for an opera. Moscheles was taken to the house of the father of these young people—a gentleman of distinction, cultivated, refined, and wealthy. It was a visit of singular, pregnant import. Felix and Fanny Mendelssohn were playing when the young maestro was ushered in; and in those first notes Moscheles read the possibilities of the boy's future, the career manhood was to develop, the legacy that was to be lavished widely upon all generations to come. They were performing one of Felix's own compositions, and there were visible no traces of crudeness, nor lack of every sentiment necessary for expression. Moscheles played himself for them. The young Felix was enchanted, and Moscheles was speedily introduced to all the household.

"This is a family," he writes, "the like of which I have never seen. Felix is a phenomenon. What are all prodigies as compared with him?.....His elder sister Fanny is also extraordinarily gifted..... Both parents give one the impression of being people of the highest refinement .....I attested my conscientious conviction that Felix would ultimately become a great master—that I had not the slightest doubt of his genius."

How little Moscheles guessed at the full meaning of his prophecy, or how much mutual happiness was to ensue from this first meeting! During his stay in Berlin he was constantly with Felix, who united to his boyish gayety of spirits a fund of thoughtful intelligence, which put him even then upon a level with older men. His education had been strictly supervised by his father; and he and his sisters, to whom he was passionately attached, had pursued their classical studies together. Every possible advantage that wealth and consideration could procure had been lavished upon them. Added to this was an atmosphere of tenderness and love such as few families possess. What wonder that the hospitable fireside of the Mendelssohns was the centre around which all that was refined and artistic in Berlin assembled? There were half a dozen intimate associates of the young Mendelssohns, from all of whom, by chance records, letters, or even connected "Recollections," we gain impressions of what the circle and its centre, Felix, must have been. There was Edward Devrient, the young tenor at the Royal Opera, not only a singer of uncommon merit, but a man of general cultivation and a fineness and gentleness of nature which drew Felix to him at once. Though some years his senior, and a young married man, they became almost inseparable companions. To Devrient the painter Hensel confided his love for Fanny Mendelssohn. Hensel, though devoid of musical ear, was one of the coterie. Edward Rietz, the violinist—a sensitive, retiring young man—joined them when music was the order of the hour. Sometimes old Zelter condescended to growl at them, or with them. Poets, artists, men of various professions, and the most brilliant literary women in Berlin flocked to the house of M. Mendelssohn; while Felix, in the flush of boyish favor and popularity, with a wide capacity for friendship, a high-strung, intensely nervous organization, and something in his nature which magnetized all who came within his presence, turned to Devrient, Hiller, and, above all, to Moscheles, for the companionship he craved, and which in the latter case outlived every change of chance or time, lingering to the very moment of his early death, and ennobling and developing the natures of both men. Moscheles brought his calm, analytical judgment to bear upon the almost boyish impulsiveness of the younger man. The one shadow upon Felix's loving, tender nature was his tendency to nervous irritability, evident only on rare occasions; but this was never manifested toward Moscheles, whose attitude was always that of loving preceptor as well as friend. It was a friendship brotherly in love and masterful in comprehension and endurance. It would have been impossible for Moscheles to have written the *Midsummer Night's Dream* music; but what critic could better have discerned its subtlest beauties? When Felix would bring Fanny his music, wet from his pen, he used to long for Moscheles to see and criticise it

as well. Beyond all the pettinesses which so often cramp the boundaries of friendship, their love and sympathy lasted unbroken to the end.

The great event of this period for Moscheles was his marriage. Journeying from Berlin to Hamburg, he played gloriously one night at the Apollo-Saal. In the audience was a Miss Charlotte Embden, a young lady of rare musical culture, and distinguished for her refined loveliness of character. She listened, enraptured by the genius of the young musician, who came fresh from such incentive and tuition as association with Beethoven, Weber, Hummel, Zelter, could give. Soon after he was presented to her, and there was no doubt from the outset of their entire congeniality. In three months she became his wife, and the entry upon his wedding day in his diary bears testimony to the character of the man as well as to that of the bride he had chosen, and may be taken as prophetic of the happiness to come. "My *Ehrentag* [day of honor]. With the fullest sense of happiness, with purity of heart and intention, and full of gratitude to the Almighty, I entered this holy state, and pray God to bless me."

IGNATZ MOSCHELES.

Singularly alike in many of the exterior circumstances of life and their effect upon inner happiness, he and Mendelssohn were destined to an ideal joy in their married lives. It is to "Charlotte," the loving friend, the appreciative listener, the wise counsellor, we find Moscheles always turning. Her interest in his public career was only second to that which made her watch tenderly over his domestic happiness. There was that even balance of public and private triumph in his life which was, perhaps, the secret of his calm, gentle, and persevering nature. The Moscheleses settled in London, where he began his round of concerts, lessons, receptions, etc. Music was gaining a new stimulus in England. It was not so very long a time since the art was meagre and undeveloped, and, according to Pepys, music to which the "king [Charles II.] could beat tune" was the only kind tolerated. And when young John Jenkins came home from the Continent, full of ideas and vanities, he scoffed at the King's Chapel music, though Pepys thought his royal master's mode of "keeping tune" indicated a most appreciative sense of the science of the art as well as its growth. It was only in 1703 that at Lincoln's Inn Theatre a Mrs. Champion performed "a piece on the harpsichord for a benefit." How long ago, judging by the strides made in "benefits," "harpsichords," and "pieces!" yet it is only the other day in point of time, and many are now living who can remember when a queer little rambling "piece" on a tinkling, jingling piano-forte was considered "charming," and "quite a musical treat." At Drury Lane, in those old days we have just quoted, Dr. Pepusch used to "preside over the harpsichord;" at that time Handel, a mere boy, was in Germany. The old days of Schütz, who has been called the "Father of German Oratorio," do not seem so very remote when we consider that Keiser, to whom the origin of German opera is really due, was his immediate successor, and it was in Keiser's orchestra the young

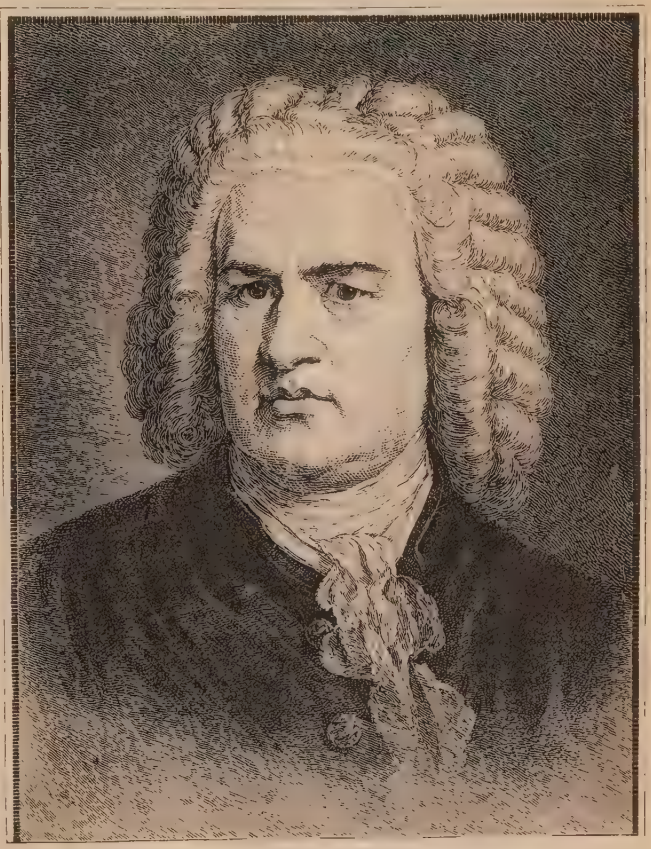
Handel was content to serve an apprenticeship as an obscure fiddler. The arrival of Handel in England gave the necessary stimulus to dramatic music and composition; but efforts were so crude, and musical taste so governed by fashion and faction, that what wonder poor old Handel, never too amiable, lost patience, wept angry, bitter tears, and cried out to many an orchestra fiddling away with languid indifference: "Vot the devil do you Engleesh *call* music?"

GEORG FRIEDRICH HANDEL.

In the early days of Moscheles's life in England musical instincts were very slow, and the condition of matters somewhat chaotic. In Germany the school of profound classical writers was growing steadily. Italy and France, although they absorbed much of the lighter element in operatic music, had not monopolized melody. Ballad music was popular in England then, as it is now, though the songs most in vogue were descriptive, and accompanied in a rather too exaggerated style. It was not quite the pretty, quaint day of "She wore a wreath of roses," about which hangs a charm, difficult of analysis, but felt with the first touch of that old-time ballad music; but tenors sang songs descriptive of storms at sea, and sopranos warbled away at the pretty though rather meaningless "concert music" written for them, and which they sang to fashionable but scarcely musically cultivated audiences. Classical music was attempted, but it may justly be said of Moscheles that he introduced it in its true meaning to England. Coming fresh from the heart of Germany, his musical feeling deepened by his earliest and constant association with the great masters of the day, he brought with him a knowledge and education which authorized the success and reception which he found. His compositions were full of traces of the school of Beethoven, though characterized often by a flow of melody and brightness which was from the nature of the man.

In 1826 poor Weber—Carl Maria von Weber—came to London and conducted his own operas, *Euryanthe* and *Der Freischütz*, at Drury Lane. Mrs. Kemble Butler speaks of the furor over Weber at that time. Audience

CARL MARIA VON WEBER.



and orchestra used to greet him tumultuously. He was a strange man—kindly, affectionate, but sad and of a nervous temperament, of which there are many traces even in his clearest, most brilliant compositions. When he came to London in the spring of 1826 he went frequently to the Moscheleses'. They were living then at 77 Norton Street, where they had already begun to gather about them a circle, which widened later, including all the most distinguished men and women in the musical and literary world. One day Weber went to dine with them. He was in wretched health. When he arrived it was with difficulty that he mounted the stairs to the drawing-room, but later he roused himself, and became the "most delightful and genial" of the guests at Moscheles's hospitable board. His public triumphs crowded one upon the other; strangely exultant chords struck before the last note was sounded. While Weber was daily growing weaker and weaker, concerts and applause and the excitement of the season went on. One day only there was a failure at a concert, and this led to some thoughts of going home.

On the 4th of June Moscheles wrote: "When I visited the great man to-day he talked very confidently of his return to Germany, but the frequen attacks of a dreadful convulsive cough, which left him completely prostrated, filled our minds with the utmost anxiety.....He hoped to see me again to-morrow. I never suspected that I was looking on him for the last time as a living man." Weber, though really alarmingly ill, would not allow any one to remain with him at night, and used, on retiring, to lock the door of his room. He was staying with Sir George Smart, and early on the 5th of June Moscheles was summoned thither. Sir George told him that Weber had retired as usual; that they had been to his room, vainly knocking for admission. So, with some other friends, the door was broken open. "The noise did not disturb the sleeper," says Moscheles. "It was the sleep of death. His head, resting on his left arm, was lying quietly on his pillow..... Any attempt to describe the depth of my sorrow would be profanation. I thought Weber a composer quite *sui generis*—one who had the imperishable glory of leading back to our German music a public vacillating between Mozart, Beethoven, and Rossini." Weber's funeral was conducted with sad solemnity on June 21, when he was buried in the Catholic chapel at Moorfields.

When Moscheles returned to Berlin in 1826, a new musical surprise was prepared for him. Felix had passed beyond all limits of boyishness in composition. When Moscheles went to him he produced a MS., which he and Fanny played in duet. It was the since world-famous overture to the *Midsummer Night's Dream*. He had failed with an operetta, had experienced some wholesome criticism, and in a burst of genius not destined to be transient had produced the work which is of all others the permanent association with his name. "The Mendelssohn," wrote the loving Devrient later, "we possess and cherish dates from this composition." His idiom is completely characterized in this work. Later efforts seem a broadening out of the foundation laid in these days. The mind of the master developed with that first rush of musical impulse, and the Mendelssohn whose pen rested on

the triumphal score of the *Elijah* was only the Mendelssohn whose boyish genius broke forth in the overture to Shakspeare's poem, in a wider, completer sense.

The charmed circle which lent its tender sympathy to Felix and his friend still continued unbroken. On Sunday evenings an assembly met always at the Mendelssohns'. Devrient and his charming wife still were intimate with Felix and Fanny, and a great desire now arose to revive Bach's splendid Passion music. Mendelssohn and Devrient combined to resurrect it, but Zelter was the great obstacle to success. Devrient gives an amusing picture of their visit to the old tyrant to enlist his sympathies, without which nothing from chorus or orchestra could be hoped. Much had to be done which was real labor, but this they felt they could carry through if Zelter's approval was obtained. From one of his quaint caprices Mendelssohn insisted that he and Devrient should be dressed precisely alike when they called at old Zelter's; and accordingly two young men in "blue coats, white waistcoats, black neck-ties, black trousers, and chamois-leather gloves" started out, Theresa Devrient having given them a cup of her delicious chocolate, for which Felix had a childish fondness. It was one hundred years since the notes of the Passion music had last died away. Mendelssohn's gay spirits were subdued, as they went down the Opern-Platz, by this reflection. He stood still, and exclaimed: "To think that it should be an actor and a Jew that give back to the people the greatest of Christian works!"* Zelter was found in a cloud of smoke, from which he emerged with gruff greeting to the young musicians. Devrient unfolded their plan. Zelter stormed at the idea, and growing positively abusive, Mendelssohn tried to draw Devrient from the room. But Edward luckily understood the old maestro too well. After indulging his rage at their audacity—to think *they*, "two young donkeys," could interest Berlin in that buried music!—the old man gave way, and actually promised assistance. So the rehearsals began. The principal opera-singers were ready to help; an orchestra and chorus were provided, and for the first time Mendelssohn's rare faculty as a conductor was shown. Edward Rietz assisted in the conducting; Devrient sang the part of Christ; Zelter lent his grave, dignified presence; while Felix, his whole soul lifted into exultation by the spirit of the great composer, held together the great mass of singers, instruments, musicians, the magnetism of his presence and leadership affecting them all with one common impulse. Zelter's remonstrances were silenced. The music, after a few rehearsals, was pronounced revived. Edward Rietz was singularly capable of

SEBASTIAN BACH.

* Mendelssohn was educated a Christian. He referred to his ancestry.

emotion. When the performance finally took place, a transcendent power seemed to possess him. Von Schätzel sang the aria "Ebarme Dich!" to his obligato accompaniment. Mendelssohn's face lighted with an earnest glow before them. The immense audience were thrilled into an enthusiasm rarely experienced before. When Devrient's part came—"I sang," he says, "with my whole soul and voice, and believed that the thrills of devotion which ran through my veins were also felt by the rapt hearers."

Not only those engaged in the great work, but later critics, have averred that to this successful endeavor of the two young men we owe the later permanent interest in the music of Sebastian Bach.

"Since the doors of that musical house were closed," writes Chorley, in the *Athenæum*, speaking of the Moscheleses', "there has been nothing of the kind in this city except during the short time Adelaide Kemble was on the operatic stage."

Social relaxations were always welcomed by Moscheles, in spite of his numerous daily lessons and increasing work of composition. In the evening, when friends came in informally, he would sometimes have to sit by, correcting proof, revising MS., etc., but always cheerful, interested, and attentive. The generous, cordial hospitality of the Moscheleses was felt far and wide, claimed by many distinguished as well as obscure friends. Heine the poet spent much of his time during his English visit with them. Sometimes Sontag would come to them, dining *en famille*, or making one of their evening guests, when she not only sung, but charmed all by her grace and the loveliness of her mind and person. At the opera her box was always at the Moscheleses' service. "To-day," writes Moscheles, "I was present at the full-dress rehearsal of *Il Barbiere*. She enchanted every one with her Rosina." Again: "The Duke of Devonshire danced with her at his own ball, where her beauty and grace made a great sensation."

Once when she could not sing at Moscheles's benefit, because of the tyranny of a director, she gave out that she was hoarse, and went to the concert with Madame Moscheles, and when Moscheles spoke of it she answered, sweetly, but "S'fettl immer noch S'fettl."

All London went mad over the beautiful prima donna. Musical notes of that day are full of enthusiasm, but in private with such friends as the Moscheleses, on an occasion when she met Walter Scott at their house, for example, her sweetness and beauty were seen to best advantage. Paganini, with his wonderful dark face and strange air; Lablache, the inimitable basso; Schröder-Devrient, the prima donna; Klingeman; Meyerbeer—all these names recur frequently as guests at the Moscheleses', while the master's hand and brain are rarely idle; compositions were produced rapidly; every day his playing was growing more and more famous. A noted critic of that day, recalling later Moscheles's playing, speaks of it as surpassing in technique any thing he had ever heard, his wonderful execution, the certainty with which he passed from one interval to another, the nicety in expression, so that the ear was never shocked or rudely jarred, and, above all, the depth of feeling with which he treated the music of his beloved ones—Beethoven, Handel, Bach. He seemed to feel that a special legacy was left him to make their works better known, appreciated with a truer *heart feeling*.

One day Mendelssohn arrived in London, going directly to the Moscheleses, in No. 3 Chester Place, Regent's Park, where they lived. He was welcomed royally, and after dinner the young musician produced his new music, six *Lieder ohne Worte*—music now so famous. Touched for the first time by the young master's hand, what wonder that Moscheles, impressed by its spirit and life, its tenderness and deep feeling, said that in it he read the germ of his friend's immortality! Mendelssohn staid only a short time in London, but he created a profound sensation, and his name and music spread widely through public and private circles. He came to the Moscheleses' morning, noon, and night, his boyish good spirits infecting all the household, just as his music vibrated to their deepest heart pulsations. We have a good picture of him in these light-hearted days of twenty—a young man of middle height, rather slender in build, but with a free quick step which denoted his fine muscular development—a young man who could ride and walk and swim, and handle a foil as easily as he could play the "Spring Song" which has come down to us full of his soul's deepest meaning. In feature he showed slightly his Oriental descent; in the brow and eyes, the cut of the mouth and chin, the deep thoughtfulness of his character was shown. His laugh was peculiarly sweet. The tones of his voice, said one, writing of them when they were echoes only, "were a little hesitating at times, but had in them a touch like the voice of a dear friend." There was felt by all who approached him his peculiar magnetic power; no one who knew or even talked with him could resist it. And it was this personal fascination which, added to his fine appreciative sense, made him so wonderful a conductor. Even in these days of unclouded good spirits he was full of excitability, but against this evil in a man of genius he had an ever-ready balance. He could sleep at any time—a long dreamless rest of twelve hours frequently succeeding any prolonged mental effort, and thus the overstimulated brain was pre-

served and calm restored. During this London visit he went out constantly, making friends and admirers every where. Devrient, in the calmer Berlin atmosphere, was a little anxious for him, and wrote in half-serious remonstrance. He feared he would lose sight of the loftier purpose of his art in the glitter of fashionable London drawing-rooms.

"What would you say to me," wrote Mendelssohn, in half-jesting annoyance, "if I were to implore you not to be carried away by the glitter of Spontini, but to remain true to good music..... Life and art are not to be separated; and if you have no fears of my going over to Rossini and to John Bull, you must also have none that the life here is dragging me down.....Upon my word, Devrient, when I improve or deteriorate I shall let you know by express.....You wish, my dear friend, that I should make some noise and *éclat* here. For the sake of my future prospects, I am glad to tell you that I have already done so. The English receive me, and are kind and pleasant with me. For this year music is nearly over, the season is drawing to an end; but for conscience' sake I am going in a few days to play Beethoven's concerto in E flat. Musicians think it impracticable, and say the public will eat me; but I don't think so, and shall play it. On the same day my *Midsummer Night's Dream* is to be given..... Write soon, and love me."

SIGISMOND THALBERG.

Moscheles's pleasure in the young man's society was intense, and Mendelssohn as usual looked to him in every way for sympathy and counsel. It was certainly a very happy period of mutual intercourse.

"Mendelssohn came in," writes Moscheles. ".....We had such a morning of music!" Think of what it must have been to *have* Mendelssohn "come in," to *have* a "morning" of his music! These were pleasant days, and there was a great charm about a musician's life even in that period of slow understandings and applause that was not always appreciation. Great people were to be seen daily in unconscious London. Fancy crossing Piccadilly and meeting Mendelssohn and Moscheles and Thalberg coming with rolls of music in their hands from the Philharmonic rehearsal! The Philharmonic had not reached the Ninth Symphony, but their instincts were quickening. Somewhere in busy London a young man was preparing the future of the *Elijah*. Moscheles used to talk hopefully to his dear Felix of the to-morrow even in England, and in the circle at Chester Place all musical impressions and influences were cordially, earnestly received. The two friends would come home from rehearsal to find Malibran waiting, ready, as she used to say, to sing "jusqu'a l'extinction de la voix." She was always a welcome visitor, delighting even the little children of the household.

Mendelssohn performed at the Philharmonic Concert, playing the *Midsummer Night's Dream*. The audience were more than enthusiastic. Many years later one who was a boy in that company recorded how crowds flocked into the anterooms to see the young musician. He was standing a little apart—the dreaminess of his gaze intensified by the emotion he had gone through in playing. The little boy, who had listened in awe and wonder, now found himself abashed in the presence of the master. Sir George Smart presented him, and Mendelssohn gave his usual sweet, cordial greeting.

"Is this to be a musical boy?" asked Mendelssohn. The child said no. "Ah," replied the young master, with a quick sigh, "so much the better for him *here*," touching his brow as he spoke. With all the buoyancy and freedom of his spirit, somewhat of the shadow of his death seemed to lie upon him.

The Berlin coterie was agreeably widened by Fanny Mendelssohn's marriage to the distinguished painter Hensel. When Felix returned from his sensational London visit he found the Devrients in the "Garden-house" on the Mendelssohn grounds, and Fanny Hensel and her husband occupying a suite of apartments in the family abode. It was a charming arrangement for Felix, whose time was divided between his work and social intercourse with his beloved friends, and the friendly harmony which prevailed was expressed in an operetta he and Fanny composed together to celebrate the silver wedding day of their beloved parents. The affair was to be purely domestic, very few outsiders being admitted; the Devrients, of course, shared in the work, and the rehearsals were provocative of much pleasure and amusement, particularly as Hensel's part was very ridiculous. Owing to his having no musical ear, Felix had written a part for him which was entirely on one note, and the amateur troupe were thrown into convulsions of laughter even during the rehearsals by his somewhat gloomy monotone. An evidence of Felix's excitability occurred during the preparation of this fête. It suddenly became known that Devrient would have to sing at court the very evening of the performance. All Felix's joy was damped. It seemed to him cruel and unreasonably exacting. He stormed and raged on hearing of it; his father finally interfering, with a firm command to him to go to his room. He obeyed, and found a refuge in his never-failing consolation of a prolonged sleep, and the next day his calm sweetness of temper was restored. Devrient managed, on the night in question, to leave court early enough for the operetta, which proved a decided success—Felix leading in the orchestra, all parts being charmingly sung except poor Hensel's, who started off upon a wrong note, carried it through thus, although the right one was shown, whispered, sung at him, while Felix's laughter became so unrestrained he was forced to bend down over the score to conceal it.

The extreme delicacy of Mendelssohn's nature was shown in his refusal to publish the little work, which he felt purely a home association; connected as it was with those so dear to him, he could not give it to the world. As usual his search for an operatic libretto continued; but a fatality seemed to attend all efforts in this direction, though his ambition and interest remained unchanged, even while he vented his dramatic fervor and impulse in such oratorios as *Elijah* and *St. Paul*.

These were charming days with the Hensels and Devrients. They used to read aloud Jean Paul and Hebel; they painted together; Felix wrote music to Devrient's verses, and Theresa sang for them while they worked. Sometimes they were absorbed in chess or French declamation; happily there was great versatility in the little coterie, and the very interchange of political opinions had its interest from the strong individuality of all the party. Meanwhile Mendelssohn worked at the Reformation Symphony. The peculiar joyousness of parts of this great work seems like an expression of the young master's happy life at the time. The dewy freshness which in the scherzo is like the sudden sweetness of May blossoms, the look of green fields when a summer rain has lightly touched them and the sun unveils itself, seems to be as an utterance of the tranquil, busy life, the mood which found its reflection not only in his work at the time, but in the very faces clustered about him. Hensel was working on his portraits in pencil, and Mendelssohn delighted in walking up and down, talking to him while he worked. He was fond of talking and walking together. There was a sort of covered gallery outside the house; he and Devrient used to walk there together when it rained. Once, when his younger sister, Rebecca, was taken ill, as he was about to start for the Continent, Devrient spent an hour in this fashion trying to reason Felix out of his superstitious fears at leaving her. "He poured himself out," says Devrient, "in almost infantile lamentations." The result was that Felix caught the disease himself, but both recovered speedily.

The Continental tour was productive of much pleasure and instruction for Felix, and for the circle at home in the charming letters since published in book form. He wrote Devrient constant little notes, characteristic in their tenderness and simplicity:

"Write me a long letter," he says to him, from Vienna, "four sheets, with gossip, pictures, and notes; in fact, chat with me. I

should think you sometimes longed to do so; it is not a thing one longs for singly, and I do so very often. Let me know what and how you are singing, how your white morning jacket is, and whether you are painting.....In a word, say good-day to me. Am I strange because I am far away? I certainly am far away, and it is a long while since we saw each other. When I sing any thing out of the *Heimkehr*, it sounds sadly like a remembrance of the past.....In the choral you will receive as soon as it is done you will find an aria for your voice. Have the goodness to sing it in a state of anguish. .....I have become so lazy with my pen, and write so badly, that I may be forgiven, but you know what I mean. When the head is giddy with thinking of the Styrian Hills, Venice, 'The Assumption of the Virgin,' by Titian, etc., writing and many other things are forgotten. The main things, however, are not; and so good-night."

Later, in answering some half-jesting observation of Devrient's as to his indifference to fame, he writes:

"If it had been the will of God that at twenty-two I should be famous, then famous I most likely should be.....I compose as little with a view to becoming famous as of becoming a Kapellmeister.....I look upon it as my duty to compose just how and what my heart indites, and to leave the *effect* to Him who takes heed of greater and better things. As time goes on, I think more deeply and sincerely of that."

ROBERT SCHUMANN.

Meanwhile he writes tenderly to the Moscheleses in London. Music was progressing pleasantly for the master there, and new stars were added to the social artistic firmament. Paganini had been making a great sensation. The Philharmonics had included Moscheles as a director, and concerts were being constantly given in which he took leading parts, but his chief happiness was with his wife and children. On his wife's birthday he always had the habit of beginning some special composition. So his work had the enduring association with her beloved name and presence. When his son was born, great rejoicing was felt among sympathetic friends like the Mendelssohns. The boy was named Felix,* and the godfather wrote in characteristic strain, congratulating and appreciating the honor done

* Now an artist of distinction.

him. He drew a sketch of a chaotic-looking collection of musical instruments supposed to be performing in the boy's honor. Later, when Mendelssohn came to London, there was a christening fête, for which Mendelssohn wrote the cradle song. Neukomm and Barry Cornwall were of the party, and wrote verses appropriate to the occasion. During the same visit Mendelssohn and Moscheles appeared constantly together in concerts, the fame of the former steadily increasing; but it was in Moscheles's happy home circle the sweetness and charm of his character were shown to best advantage. He delighted in taking the children off for a holiday. They would go to the Zoo together, his enjoyment dependent upon theirs; or sometimes when he came to Chester Place freighted with the heavy cares of orchestra or piano concerts, he would cheerfully give an hour to improvising for their benefit on nursery themes, or amuse them with all manner of childish nonsense and joking. Occasionally a weariness overcame him in the midst of his work, when he would go to Mrs. Moscheles for womanly sympathy and counsel. She used to make him lie down quietly upon the sofa in a darkened room, or would sit talking to him upon indifferent topics—current questions of interest which had no bearing on the baton or piano. Mendelssohn's ever-active, earnest mind found room for innumerable interests, and beneath the boyish gayety and apparent carelessness of spirits was a calm, enduring Christian faith—a desire to make his life the complete whole designed by a Higher Will than his own.

Moscheles accompanied Mendelssohn when he returned to the Continent. The latter had just undertaken the direction of the Gewandhaus concerts in Leipsic, where, in 1843, he founded the Conservatory since so famous. From Leipsic Moscheles wrote back tender greetings, descriptions, etc., to the loving friend at home who was ever present in his thoughts. "I begin the day," he says once, "as I like best, by asking after you and the children. Is Emily composing? Serena learning an epic poem by heart? Felix storming a fortress somewhere?" Mendelssohn used to scribble off postscripts to Moscheles's letters. "Let me slip in," he writes, "between the envelope and wafer." He was full of friendly jests with those whom he loved. Chorley, I think it was, said he had a way of smiling gently as he jested, giving the words, though full of fun, a touch of loving endearment. He had a fashion of stroking Devrient's shoulder, and pronouncing his name with a little tender drawl. These familiar gestures, tones, and words seem to recur to those whom he loved, and who lost him, with a sharp pang of regret, showing how intensely he influenced them while he was among them.

During this tour the two friends used to go often to the Wiecks', where there were impromptu musical parties, "Papa Wieck," as he was called, sitting in somewhat arrogant judgment. Clara Wieck, later the famous Madame Schumann, was a mere girl then, but her playing enchanted the "two M.'s." At that time a timid, retiring young man, with a large face, absorbed and melancholy in expression, used to be one of the little circle. We think instinctively of the tenderness of summer-time, the gentle fall of rain, the pulsation of some sad heart, when the music he has left us fills the air. He was not quite understood then, except by so appreciative a coterie. It was later that the name of Robert Schumann was widely known, when he left it to the woman who was his devoted wife.

"I went with Felix to the rehearsal," writes Moscheles. "His admirable conducting, speeches, observation—in fact, his general behavior to the orchestra—filled me with affection and respect."

It is said that even in that highly colored romance *Charles Auchester*, where the part of Seraphael is intended for Mendelssohn, his power as a conductor and his magnetic influence over the orchestra are not exaggerated.

The death of the elder Mendelssohn turned Felix's thoughts into a graver channel. His future seemed to shape itself with more of definite purpose. His grief was intense; but happily Fanny Hensel's presence was a balm to him, for her marriage had in no way alienated her from their common sympathies and tastes. She appreciated, as did Felix, what they had lost in so loving and sympathetic a parent. "Do you remember," she wrote Mr. Moscheles, "how Felix, one autumn evening you spent with us, played the exquisite adagio in F sharp major, from one of Haydn's quartettes? My father had a special love for Haydn's music. The movement was new to him, and so powerfully affected him he wept as he listened.....My anxiety for Felix is at an end; he has collected all his energies, and deep though his sorrow be, it is natural.....He must recover if he wishes to live up to his father's standard, as he never failed to do while they were together."

Felix, somewhat out of health, joined his friend Ferdinand Hiller in Frankfort, and there his fate awaited him. He was introduced to a charming family, that of M. Souchay, whose widowed daughter, Madame Jeaurenaud, and her daughter Cécile were living with him. The household combined those gifts which appealed to Mendelssohn's keenest artistic and æsthetic sense. Moreover, Mlle. Jeaurenaud was exceedingly beautiful, and lovely in disposition. In person she was slender and gracefully formed, with a complexion of dazzling fairness, the pink color in her cheeks varying with every pass-

MADAME CLARA SCHUMANN.

ing emotion. Her eyes, Devrient, Moscheles, Hiller, declare, were beautiful—of a "sapphire blue"—while her nose, slightly inclined to *retroussé*, and the arch of her pretty mouth, gave an irresistible piquancy to her expression. Fastidious as was Felix's taste, oversensitive as he was in regard to his ideal of woman, he succumbed at once to Mlle. Jeaurenaud's fascinations. Hiller says his infatuation was remarkable from the outset. The good-natured friend was greatly interested in Felix's outpourings. He used to go to Hiller's rooms, unable even to give his mind to music while his heart was so full of Cécile. Singularly enough, the *haut ton* of Frankfort regarded his attentions with rather disdainful criticism, Mendelssohn's fame and genius scarcely compensating in their eyes for Mlle. Jeaurenaud's patrician birth. His untouched fancy was completely captivated, his affection full of ardor and romance. The acquaintance ripened quickly; but such was the strength of his character that he subjected himself to a severe test of absence before he allowed himself to declare his affection, wishing to profess a nobler sentiment than infatuation. Meanwhile his oratorio of *St. Paul* had been given with magnificent success. Mendelssohn was twenty-eight years of age, and already crowned by every public honor, every private happiness save the one in store for him. Fortune surely favored him in destiny. On his return to Frankfort, Mlle. Jeaurenaud accepted his love, and the engagement met with hearty congratulations on all sides. The marriage took place in 1837. It was a very pretty wedding. The extraordinary fascination of the young couple was never forgotten by those present. Ferdinand Hiller composed a marriage choral, and when bride and groom returned from the church, a band of young girls in white were stationed on either side of the entrance to M. Souchay's house, singing the joyous notes of greeting. Mendelssohn and his youthful bride were touched extremely by this tender tribute of Hiller's friendship and genius.

They went away for their honey-moon to a quaint little German town, Freiburg-im-Breisgau, whence Mendelssohn wrote in exultant strain to Moscheles, Devrient, Hiller, and his own home circle. Under the new inspiration of his wedded happiness he wrote his music to the Forty-second Psalm. What more beautiful expression of the deep

peace and thankfulness within him could he have uttered?

"You know," he wrote Devrient, "that I am here with my wife, my dear Cécile, and that it is our wedding tour, that we are already an old married couple of six weeks' standing. There is so much to say and to tell that I don't know how to make a beginning. Picture to yourself. I can only say that I am too happy, too glad; and yet not at all beside myself, as I should have expected to be, but calm and accustomed, as though it could not be otherwise.....But," he adds, tenderly, "you should know my Cécile .....No journey that we can make will ever be more lovely and happy than this one."

Cécile drew and painted skillfully, and during their journey in Arcadia the young couple kept a journal which is full of illustrations of her pen or pencil. Later they came back to a home in Leipsic, whence Felix wrote enthusiastically to Hiller and Moscheles.

"Just tell me," he says to the former on one occasion, "if I ought not to be satisfied, living with Cécile in a new, comfortable house, with an open view over the gardens and the fields and the city towers, feeling so serenely happy, so calmly joyful."

A recent critic has complained that Mendelssohn's letters bear slight testimony to the all-absorbing character of his love for Cécile; but to those in whom he confided the tenderer sentiments of his life he certainly wrote with all the freedom of a young lover.

Happily these youthful transports were lasting. Devrient says they had often pictured what kind of wife their "spoiled favorite" would choose. When they saw her they realized that Felix had received the highest gift of companionship on earth. She was quiet and gentle in manner, but observant and thoughtful for the happiness of all around her. Her beauty gained new character as the time passed on. When the first flush of girlish loveliness had passed, the high-bred, noble type seemed only dignified, and the tenderness of her eyes, her smile, the sweet tones of her voice, the ever-ready greeting and kindly outstretched hand, were all recalled with sad fondness by those who had shared the hospitality of Mendelssohn's happy home. No marriage could have been more congenial in every way. Beautiful and gentle as Cécile had appeared to him in the May-flower days of his love, she proved all and more than his dearest hopes.

The spirit of the man, the reverential, exalted character of his mind, showed itself in all his domestic relations. He was his wife's lover to the day of his death; but beyond this was a feeling of chivalrous devotion, a touch of a spirit almost mediæval in character, which makes us understand how he could write those tender, soft-breathing "Lieder," and at the same time lift the voice of his humanity up to the Divine in such works as *Elijah* and *St. Paul.*

When Mendelssohn next visited London he had, of course, much to tell the Moscheleses of his wife. He was unchanged in his frank, honest friendliness.

"Our dear Mendelssohn," wrote Mrs. Moscheles at the time—"I can call him by no other name—arrived at 4 P.M. on the 8th. At 7 he was with us, the same hearty, cheerful, delightful old friend as ever. In a word, he is a model man. At dinner and the whole evening we talked over memories of by-gone, happy hours, and then he drew Moscheles to the piano.....Chorley and Klingeman came to dinner, and in the evening little Felix enjoyed such a game of romps with his famous godpapa.....We did not go to the evening concert, but sat at home chatting with Mendelssohn, who had much to tell us about his wife. The portrait he showed us makes her very pretty, and according to him she must be an angel."

"I see him," Moscheles wrote at the same time, "in various characters, as a brother, son, lover, but chiefly as a fiery musical enthusiast who appears but dimly conscious to what a height he has already attained. He knows so well how to adapt himself to this commonplace world.....While Birmingham prided herself on bringing out his newest work [*St. Paul*], he still found time to make a pen-and-ink drawing of Birmingham for our children.....In the evening I walked home with him. Our chat was so delightful.....Yesterday at an early hour the town-hall again looked imposing. The second part of the performance was devoted to Mendelssohn. He was received with ringing cheers, but seemed all anxiety to make his bow to the public and get the whole thing over.....His conducting of the band in this performance of the 'Lobgesang' effected a marvellous unity and precision, and one of the chorals of this glorious work told so powerfully that the whole audience rose involuntarily from their seats."

Chorley joined Mendelssohn and Moscheles when they departed for the Continent, Chorley's habitual gravity and reserve thawing completely under the genial influence of the "two M.'s." He was the well-known critic of the *Athenæum*—a quiet, observant man, not altogether happy in temperament, but full of kindliness for those whom he felt to be his friends. In spite of his wholesale condemnation of such writers as Schumann, his musical perceptions were usually keen, and his criticism good enough to be desired or feared. He admired intensely these two friends. In later years he could hardly speak of what Mendelssohn had been to him. On this trip they all

made merry over every trifling adventure. Once, in a railway carriage, they discovered a fourth traveller sound asleep.

"What shall we do with him when he wakes up?" exclaimed Moscheles.

"Kill him; that's the only way," said Mendelssohn, with mock tragedy.

Upon this the sleeper started up. A momentary confusion ensued, terminated by Moscheles saying, in an easy conversational way, "And afterward she said she never would have that man for a husband;" at which Chorley and Mendelssohn laughed uproariously, and the stranger appeared to think he had awakened just at the conclusion of an entertaining anecdote; but from that hour the sentence passed as a proverb among the party. In any conversational dilemma Mendelssohn used to say, "And afterward she said, etc."

LUDWIG VON BEETHOVEN.

In the winter of 1838 Mendelssohn's domestic happiness was made complete by the birth of a son.

"I feel *so* happy," he wrote Hiller, "and yet not a bit *philisterhaft*. You may laugh as much as you like; I don't care. It is too delightful and lovely to see a wee, little fellow like that, who has brought his mother's blue eyes and snub-nose into the world with him, and knows her so well that he laughs whenever she comes into the room.....In a few days we go to Berlin, so that Cécile may get to know my youngest sister [Rebecca] and the whole family." And from Berlin, where Cécile and her boy were welcomed with all tenderness, he wrote: "Our family life here has been most pleasant. Yesterday evening, when I went over to tea and found them all assembled, I read them a good deal out of your letter.....We were together that way every evening, talking politics, arguing, or making music, and it was so nice and pleasant." As usual, Fanny Hensel's presence and sympathy were an unspeakable delight to him Her "musicals" on Sunday mornings were quite famous. Felix used to play sometimes. Cécile's beauty and lovely character added a special charm to the gatherings. Devrient could hardly sufficiently express his enjoyment of Felix's domestic happiness. One evening, at a social concert organized by Mendelssohn in Liszt's honor, an hour was occupied by the young couple in entertaining their friends, a dainty colla-

tion having been provided. One who was present, writing to a friend, described Madame Mendelssohn moving about among her guests in a dress of pure white silk, looking as "beautiful as an angel." The eyes of her husband followed her with proud admiration; occasionally she would return his glance with a pretty blush and her ineffably sweet smile.

In London Moscheles had been making an effort to produce Beethoven's great Ninth Symphony. Though we could not have our fair battlements of to-day if such as he had not laid the corner-stones, there must always be a regret that his work was often a dreary effort from lack of sympathy. When he wanted to produce the Ninth Symphony there was a general outcry at the Philharmonic. In 1824 an attempt had been made, but it had failed dismally. Moscheles's energy and ambition knew no bounds. He was determined to produce the great work, and in a proper manner. After labor such as only a musician and a man of his calibre would go through, the concert and the symphony were at last announced. "Imagine my excitement," he wrote, "before and during the concert.....All the newspapers are in raptures, and unanimously insist on its remaining a fixture in the répertoire, and being performed on a grander scale either in Exeter Hall or at the Birmingham Festival."

The newspapers of that day announced and criticised in a manner somewhat different from the elaborate programmes and careful critiques of the American and English press of to-day. Here is an advertisement of one of Moscheles's concerts:

"Mr. Moscheles has the honor to announce that his morning concert will take place on Wednesday, May 11 [1836], when he will be assisted by Mme. Giulia Grisi, Mme. Caradori-Allan, Miss C. Novello, Miss Masson, Sig. Lablache, Mr. Balfe, and Mr. Parry, Jun. Mr. T. Wright will perform a Fantasia on the Harp. Mr. Moscheles will play his new MS. Concerto Pathétique, composed expressly for the occasion, a posthumous Concerto by Bach, and an extempore Fantasia. Together with Mr. Sudri's elucidation of his newly invented universal musical language. Leader, Mr. F. Cramer. Conductor, Sir George Smart."

And again, there is the concert criticism, interesting from comparison with those of to-day:

"Mr. Moscheles's Concert.—Mendelssohn's new overture of the 'Calm and Prosperous Voyage' opened the concert. This was succeeded by the 'Ave Maria' of Cherubini, by Miss Clara Novello, with clarionet obligato by Mr. Willman, both sung and played in a manner which few if any musicians could surpass. A manuscript concerto pathétique by Mr. Moscheles followed—a charming composition. Miss Clara Novello supplied Miss Masson's place (for whom an apology was made) in a duet with Balfe. Lablache sang the 'Largo Alfactotum.' Mr. Wright was much and deservedly applauded for his performance of a fantasia on the harp, and Madame De Beriot (Malibran) for the five-hundredth time delighted her hearers by executing some extraordinary passages of difficulty and compass in a song from the *Inez di Castro* by Persiani. Between the first and second acts Mr. Sudri exhibited his plan for a new universal language, with examples. We were, however, so far removed from the performers that we could not catch his explanations. He will repeat his scheme on Monday at Mr. Sedlazek's concert. The Chev. Neukomm's popular Septetto Concertante opened the second act, and which was delightfully played by Messrs. Sedlazek, Willman, G. Cooke, etc. One great charm of the concert was the production of a MS. posthumous concerto by Sebastian Bach, a composition of wonderful accomplishment and elegance [!]....No one could have played the piece in finer style. Madame De Beriot and Lablache made capital fun with Donizetti's 'O quarvate che figura'....We presume the following pieces concluded the programme: a duet by Messrs. Moscheles and De Beriot, the 'Tarantella' by Lablache, and an instrumental finale by Mozart. The room was crowded with high fashion. Mr. F. Cramer led; Sir George Smart conducted."

Mendelssohn had made no satisfactory step toward an opera, but in 1846 he completed the *Elijah*, and it was performed at Birmingham, Mendelssohn coming over for the presentation. It was a brilliant triumph; eleven numbers had to be repeated; the applause was positively stormy, and the Moscheleses shared in the exultant enthusiasm. During the course of this festival Mendelssohn gave fresh evidence of his wonderful genius. At one of the concerts the orchestral parts of a certain movement were found wanting. It was discovered an hour in advance of the time set for the performance of the piece, and Mendelssohn quietly went into an adjoining room, composed the recitative, scored and copied all the parts himself, and these were played while the ink was yet wet, the audience being equally ignorant of the emergency and his prompt rescue.

Mendelssohn, now established at the Leipsic Conservatory, after repeated efforts induced Moscheles to leave England permanently, and accept a chair in his company. Much as it was to Moscheles to be with him, he found it difficult enough to leave his beloved English public. Not only were they his friends, but in his twenty-one years among them he had had the happiness of elevating and instructing them—of giving fresh impetus and zeal to their work. There was, however, no sensational farewell. Such a one would have been contrary to Moscheles's instinctive delicacy; but at his last concert the emotion shown and felt was genuine, and the master was completely overcome. But Germany was, after all, "father-land," and turning eyes and steps toward Leipsic meant toward the most beloved of his associates.

They reached Leipsic in October, and were met by Felix and Cécile, who had already prepared their house for them in Gerhardt Garden.* Every thing was delightfully arranged. They had supper at the Mendelssohns', and witnessed the charming circle over which Cécile presided with such dig-

* A historic site.

nity and grace. Speaking of his first outlook, Moscheles wrote: "It has begun, with God's help, under the best auspices; and if you ask who is the mainspring of our present happiness, we say, Mendelssohn, and always Mendelssohn—my more than brother."

The work at the Gewandhaus and Conservatorium was speedily organized, and for our two professors was responsible but not exhausting; though Mendelssohn's busy brain, alas! was never idle. Mendelssohn headed the list of professors at the Conservatory, while Moscheles was down as head of the department for piano-forte playing and composition. David, Plaidy, Brendel, etc., were among the number. The greatest zeal and earnestness were thrown into the work. With what lingering pleasure we read all records of those Leipsic days! The coterie included the Schumanns, Davids, Schencks, Joachim (the prototype of Charles Auchester), the celebrated violinist, and many obscurer presences who lent their charm and appreciation to the little circle. The Moscheleses and Mendelssohns in quartette used to be constantly together. After an arduous day's work at the Conservatorium, or in preparation for a Gewandhaus concert, the two professors would start out for a long walk, and talk about many things. Devrient, who paid them a flying visit about this time, fancied Mendelssohn was altered —grown older and more care-worn than his years and occupation warranted. But at that time Moscheles seems to have found his companionship fresh and interesting as ever. They used to come back to one drawing-room or the other, and have happy twilight hours of converse or music. Mendelssohn used to play in a half-desultory fashion at such times fragments of the "Lieder," dreamy improvisations of their favorite themes. Sometimes, when David or Joachim would come in with their violins, he played magnificently, the "Kreuzer" ringing out upon the air, the vibrations widening, the andante softening with a tremulous thrill, which those who listened never could forget. Once, when Moscheles and Felix were improvising on two pianos, Mendelssohn seemed, he says, to grow like one inspired.

The home lives of both men were pictures of tranquil content. Family festivals used to be celebrated with a spirit of childish gayety and pleasure. On Mendelssohn's birthday the coterie arranged a delightful entertainment—a burlesque charade on "Gewandhaus," in which Joachim, in grotesque costume, performed a "hare-brained impromptu on the G string," Moscheles enacted the part of a stout German cook, and the whole ended in a concert *à la Jullien*, the orchestra being of toy instruments, Joachim performing wildly on a miniature violin. "Mendelssohn," says Moscheles, "was sitting on a large straw arm-chair, which creaked under his weight as he rocked to and fro, and the room echoed with his peals of laughter."

Impromptu supper parties used to be given among them. Devrient says the Mendelssohns lived at that time in "opulent comfort; the calm, beautiful Cécile, surrounded by her bright, pretty children, whose individual developments announced themselves at an early age." Cécile, when acting as hostess or friend, was charming as ever, and lent a sort of ideal grace to her husband's fireside. He was, as ever, watchful of her comfort and her happiness. Happily she was a woman of rare appreciative qualities. In their wives Mendelssohn and Moscheles found truest companionship, and the quartette certainly combined singular gifts of mind and nature.

In the spring Felix and Cécile went away to Frankfort and Dresden, and then Mendelssohn left his wife to go over to England and superintend the performance of the *Elijah*. Suddenly, while there, the great blow of his life fell upon him. Fanny Hensel had been superintending a rehearsal of some of her own music for a "Sunday morning;" suddenly she felt her hands giving way upon the keys of her beloved instrument, and she stood up, asking a friend to take her place. She hurried into an adjoining room, where she fomented her hands in hot vinegar. Feeling better, she paused to listen to the chorus which came from the other room. It was the "Walpurgis Night." "How beautiful it sounds!" she exclaimed, and almost in uttering the words lost consciousness, and in a short time breathed her last.

The blow fell upon Felix with the swiftness of lightning. Those who were with him when the news was brought say that he uttered a heart-rending cry of anguish they never could forget. Much of his life seemed to go out with that of the beloved sister whose companionship and sympathy had been life-long. He rejoined his family in Frankfort, and they went on to Switzerland, where he forced himself to be calm, and resumed work. Stricken as he was, the natural sweetness and activity of the man's nature roused him to some outward show of calm and interest in life. His work was redoubled, but though a cheerful intercourse was renewed with his friends, the shadow hung upon him. At times he labored with feverish zeal, and Cécile, who watched him with daily increasing anxiety, would tenderly remonstrate. "I have work to finish," he once said to her, with his gentle smile; "the time for me to rest will soon be here."

One night there was a large reunion of friends to hear Mendelssohn play. Madame Schumann was among the crowd of intense listeners. Mendelssohn began Beethoven's

great F Minor Sonata (Appassionata). His whole being was fired with emotion. Never had he seemed so to gain inspiration, forgetting all around him. On finishing the andante he gave the final chord, like a passionate cry to those who listened, but suddenly moving his hands, he rose and crossed to the corner to Madame Schumann. "Finish," he whispered; "I can not." His look, his air, were so impressive she mechanically obeyed. Meanwhile the listeners sat spell-bound, the vibrations of Mendelssohn's playing ringing in their ears.

There is a tragic pathos about the story of this last year, although with his friends, with the Moscheleses, to whom as ever he went daily, he seemed at times light-hearted and happy as in the days divided from the present by his one great grief. A presentiment had always hung over him that he could not long survive his sister Fanny. Moscheles and his wife and Cécile tried to shut out from their eyes and hearts the fact that he was daily losing his hold upon life. But indeed the fair hours of that happy friendship begun in such youthful days were fast drawing to a close. His conscientiousness in his work never lessened; the smallest effort was marked with his usual ambition toward perfection. It is marvellous how, in the midst of wealth and luxury, he never failed in his daily work, believing his gifts were divinely ordained—to be worked out for the honor and glory of the Giver.

To Devrient he wrote last in the summer of 1846, ending his letter with characteristic tenderness:

"Thanks, thanks, thou true, good, faithful friend! Thy FELIX."

Early in October the quartette had many happy hours together, in spite of Felix's failing strength. "Delightful afternoon at the Mendelssohns'," Moscheles records. "Had much friendly talk about art matters. He played me his last quartette, *all* four movements in F minor. The passionate character of the whole and the mournful key seem to me an expression of his deeply agitated state of mind; he is still suffering and in sorrow for the loss of his sister. He also showed me some of her MSS."

A day or two later the two friends went out for a long walk together; they talked earnestly, happily, for the last time alone. They traversed half the town, not heeding time in their friendly, sympathetic converse, though it was raining steadily. In the evening a congenial party united at Mendelssohn's. Rietz was there, and he and Felix played for an hour. On the 9th of October he came as a guest to Moscheles for the last time. Although so much of the fine physique, the master-mind, remained untouched, they could not but note the changes growing hourly upon him. Mrs. Moscheles watched his somewhat languid step as he crossed the garden, and when he came in she asked him, anxiously, how he felt. He smiled, but answered: "How do I feel? Well, rather shady."

Moscheles insisted on their going out to walk, and so they started—Charlotte, Felix Moscheles, and the "two M.'s." Mendelssohn's spirits revived in the bracing air; he talked quite brightly, telling them more details of his English visit, especially his morning with the Queen, when she sang for him, and then took him through the royal nurseries, explaining all the domestic arrangements of the palace. And then he told them of the birthday gifts he had in store for Cécile, among them his and Klingeman's Scotch diary, which he had been illustrating and having bound to present to Cécile on her coming anniversary. The friends parted, much cheered and invigorated. Mendelssohn on his way home called at the house of his friend Frau Frege, one of their kindred spirits, a lady who had agreed to sing in the next performance of the *Elijah*.

"You must help me put together a book of songs," he said to her, going in. "The Härtels are pressing me so to publish it."

They arranged them from the loose sheets on the piano, and Frau Frege sang them for him. He was deeply moved, and began talking to her about Fanny. He had been to Berlin. "I can't tell you," he said, "how melancholy Fanny's unchanged rooms made me. But," he added, "I have so much to be thankful to God for. Cécile is so well."

He made Madame Frege sing over many of the songs. They decided to exclude the "Spring Song" from this book, as lacking in sufficiently serious an element for the rest. When they had talked them over, he said, "If you are not tired, let us try over the last quartette of the *Elijah*." But the twilight was deepening; and Madame Frege found the piano and music in such closing shadows she could not read, and so left Felix to go for lights. Coming back, she found him, pale and cold, upon the sofa. With difficulty he made his way home, where at seven o'clock Cécile found him very ill. By morning all Leipsic was filled with anxiety. Moscheles's condition of fear and suspense was intense; and only when, after a few days, Mendelssohn rallied, and talked hopefully of conducting again the *Elijah*, he breathed freely. On the 25th Mendelssohn wrote, with forced cheerfulness, to his brother Paul:

"Write me a couple of lines soon again" (he says), "and be sure you agree to come. My love to you all, and continue your love for FELIX."

But on the morning of the 30th Paul was summoned hastily. The valley of the shadow was closing out all earthly sounds and interests: Mendelssohn was dying.

How tender, how gentle, was the love be-

tween Moscheles and Felix since those sweet boyish days we can never better understand than now, when the parting was at hand. Retrospection makes so tragic a background for such final moments, when every look, or word, or tone becomes the last with which one feels his memory may be stored! Day and night Moscheles watched beside him, but no human ministration could avail. All musical proceedings were silenced. A grand concert had been in preparation, but who could be found to touch one note while the master was passing silently into eternity? In Moscheles's diary we find him breaking out into a passionate prayer to the Almighty that the life so precious to him may be spared. The evening of the same day finds him, with Charlotte and Cécile and others, at Felix's bedside. There was no consciousness. The friends—the beloved wife—knelt, watching the light gradually fade in that "peaceful, seraphic" countenance they had seen touched by every passing cloud or joy. It was a little after nine o'clock when, without a sign, saying only, in answer to Cécile's inquiry, he was "tired, very tired," the end came.

Moscheles tells us that he knelt some time in prayer beside the form of his beloved Felix. What an hour, what a struggle, for the generous-hearted friend! What tender memories must have risen in the shadow of that long farewell!

Devrient had been waiting in Dresden for news of Felix's recovery. Instead of this, Clara Schumann came to him in tears, and with a fatal letter in her hand. Among all who had known and loved him every personal concern was forgotten in the sorrow, the desolation, of his death. When Devrient reached Leipsic the town seemed dumb with anguish. He went at once to the saddened household to look upon his friend in his tranquil sleep.

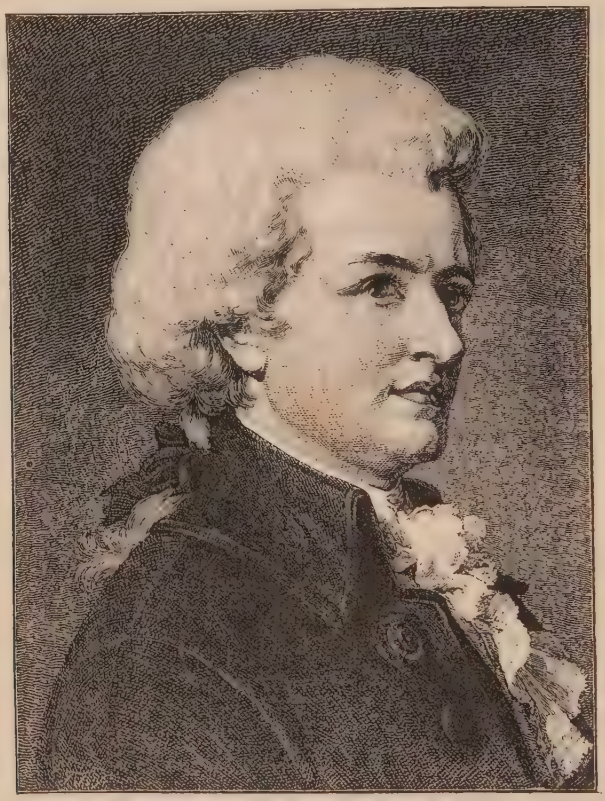
When he was dead they laid him upon what seemed to be a bank of flowers. Palm branches were strewn about the bier; the fairest white blossoms lay scattered where he slept. All look of care had vanished from his face, recalling the singular beauty of his boyish days—the days which poor Devrient thought so full of joyousness and song, when Mendelssohn's genius and presence were like a happy holiday to them all. His laugh, the tones of his sweet, endearing voice, the touch of his now quiet hands upon the keys—all silenced. "The span of time in my remembrance," writes this tender friend, "incloses the whole happy youth in one perfect and indelible thought."

Cécile talked to him the following day of his old-time friendship with Felix. She was calm with the dead calmness of grief that can not find its way to tears. During the day a throng of people visited the dead master. The offering of Leipsic, palm branches, covered his pall. "It looked," says Devrient, "like an 'Isle of Peace.'"

The funeral procession led all through the town, past windows and squares full of sorrowing people. In the church of the university the burial services were read, the music being from *Antigone*, and the choral "Jesus, meine Juversicht," and choruses from *St. Paul*, and from the Passion music of Bach, which he had so nobly helped to revive. Did it not recall to Devrient the happy summer day when the two young men, in their gay dress, made their way to Zelter's house? Had not the intervening years been one prolonged effort to do the noblest in the work allotted to him, to fulfill the grand design of his Creator?

When nearly all had left the church Cécile approached the coffin, and took her last farewell in a long, silent prayer.

Moscheles's earnest nature is shown in his persevering at the Conservatory, with no outward show of listlessness in the enterprise, after the death of his beloved colleague. "He invited me," wrote Moscheles, "to take part in an institution that was so dear to him. To have labored there *with him* would have been a daily joy and satisfaction; to work on there *without* him is my duty, which I regard as a sacred trust committed by him to my keeping. I must now work for us both." And again: "In spirit, though not in presence, Mendelssohn is with us throughout this dreary winter. The constant visits to Cécile and the dear children, the reading over of his beautiful letters to us both, the perusal of his music from the *Kinderstücke* Clara learns, to the duets I play with Serena, and his great works which I study myself—such are the consolations which he has bequeathed to sorrowing friends."



In spite of wars and political disasters, Moscheles's public and domestic life went on evenly. The Gewandhaus concerts were enriched by the music of Clara Schumann and her husband. Moscheles's spirit knew no daunting; his interest in pupils and work continued unabated. The hospitable fireside at which his wife was such a sweet presiding genius welcomed friends and newcomers as of yore. New developments were interesting the musical world.

Back into the shadowy past were the days when the young Moscheles visited Salieri and played on his tinkling little instrument, when Felix performed the minuet from *Don Giovanni* for Goethe's tea-drinking friends. Zelter tells this story of Felix's first triumph at the piano. One night Goethe had assembled a party of musical and literary people for tea and criticism and social converse. Zelter was to bring one of his most promising pupils to perform; and presently the door opened, and there appeared the gruff old master and a little boy of eleven, with

what Sir Julius Benedict says was a "supernaturally beautiful" face—fair and refined in outline, yet with the flush of good health and gay spirits on it. Germany was full of Goethe's greatness, and the little boy stood in some wondering shyness before the great man. Goethe, however, tenderly stroked his hair and bade him play.

too boldly adventurous spirits he writes: "My chief objection to the innovators is that they aspire to go *beyond* Beethoven, and altogether dethrone Mozart and Haydn, hitherto acknowledged key-stones to the foundation of music."

One day, "at the old house, 3 Leipsigerstrasse," in Berlin, he records a day with

JOHANNES WOLFGANG AMADEUS MOZART.

"What shall it be?" said Goethe, indulgently.

"Shall I play you the loveliest thing in all the world?" cried the little boy, with childish enthusiasm. And the elder genius assenting, Felix Mendelssohn is seated before the piano, wax lights are placed on either side of him, the beautiful boyish brow, the clustering brown curls, the eyes, even then full of thoughtful lustre, are touched by the glow of light, and the minuet from *Don Giovanni* fills the air.

Now *Lohengrin* was exciting the minds of the musically inclined; Liszt was famous; Rubinstein, a young man, was beginning to excite admiration and attention, his face and hair recalling to Moscheles those of his beloved Beethoven. All strides forward Moscheles cordially encouraged, but of some

Cécile Mendelssohn and the children. Felix's widow was living in calm retirement, nobly devoting herself to her children, trying, as she told Devrient, to make them worthy of their father. She asked Moscheles to play on Felix's piano—the Erard which had so often responded to the master's touch. He played many things for her, and at last touched the delicate arpeggios of the "Spring Song," which brings Mendelssohn in his tenderest mood so suddenly to life. "It was too much," says Moscheles, "for poor Cécile."

In September of 1853 Hiller called at the house of Madame Jeaurenaud, in Frankfort, to see Cécile, who was with her mother. He rang the bell, which, he says, pathetically, so often answered to his touch in happy days. Madame Jeaurenaud her-

self admitted him. "Oh, Mr. Hiller," she cried out, "is it you? I have just lost my daughter."

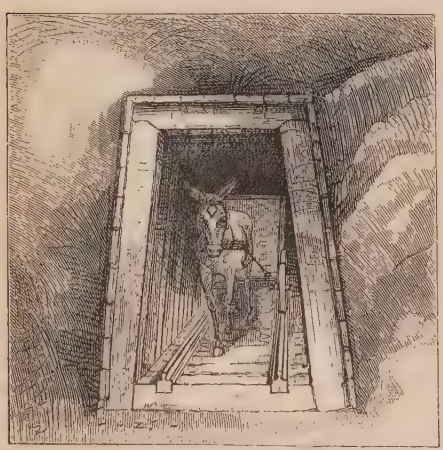
The death of Cécile Mendelssohn seemed to end one phase in the life of Moscheles, to make one period a complete tender memory. Music was still his deepest enthusiasm; but in these later years are happy, peaceful pictures of the musician surrounded by his friends, his wife and children. One night he had a strange dream of Beethoven. A few days later there was a final effort at the Gewandhaus, and before another week had passed away, on the 10th of March, 1870, having, we may say truly, fought his good fight, finished his course, death came.

Writing of the end of such lives as Mendelssohn's and Moscheles's, how can we, who live among their echoes, say *finis?* Spring and summer time come back crowded with pictures which the music they have left us brings to mind. There is the cheerful house in Chester Place; the hospitable rooms at Leipsic. The windows are open wide; June sunshine fills the air. Mendelssohn has come in with a new "Lied." Charlotte, Cécile, the genial host Moscheles, stand about; the music goes on; life, youth, association stretching out in those tender chords, making to themselves an immortality in whose glory we of to-day stand with reverence and love. What scenes, what days, of "happy, idle work!" The records reach us with a sort of awe, that, out of so much fortune and prosperous circumstance, the Divine ordinances, the tasks so difficult to accomplish, were all fulfilled, and a widespread, growing legacy lavished on the world. From one generation to the other, from one master to the other, such work goes on, joining hands, speaking from heart to heart of diviner impulses, harmonies more perfect, battlements more fair—when the Day breaks, and the last great meanings of the art become our own.

SILVER.

WHEN, in 1850, adventurous explorers in Nevada found among the barren, stony mountains masses of gray quartz with brown veins shot through the stones, they passed them by in ignorant neglect. They looked for gold, and the stones were only a hinderance in their work. They threw them aside unheeded, and toiled on in their search for the only treasure they knew. Even in these later and seemingly wiser days prospecters looking for gold have thrown away as useless black ores of lead, thinking them of no value, when they were worth more than all the grains of golden dust they could find. They knew nothing of the strange loves of the precious metals, and, content with the little gold they could find, left greater wealth in wasteful heaps upon the naked hill-sides.

It seems a law in nature that the most useful shall be the last found, the most valuable the most neglected till its worth be known. Coal was only a stone of the fields till intelligence discovered its brotherhood with the diamond. Flakes of gold and scraps of native silver were found before history began, and by the time traditions crystallized into history these metals were in use as coins and ornaments, yet their recovery in great quantities is wholly a modern experience. Of the two, silver is the more widely distributed and the more useful. It mingles and combines with nearly every element, and yet, with all its wide affinities and ready loves for things common and unclean, silver is wife of its lover gold. In spite of its universal appearance in every imaginable shape and form, it has truly a noble soul.

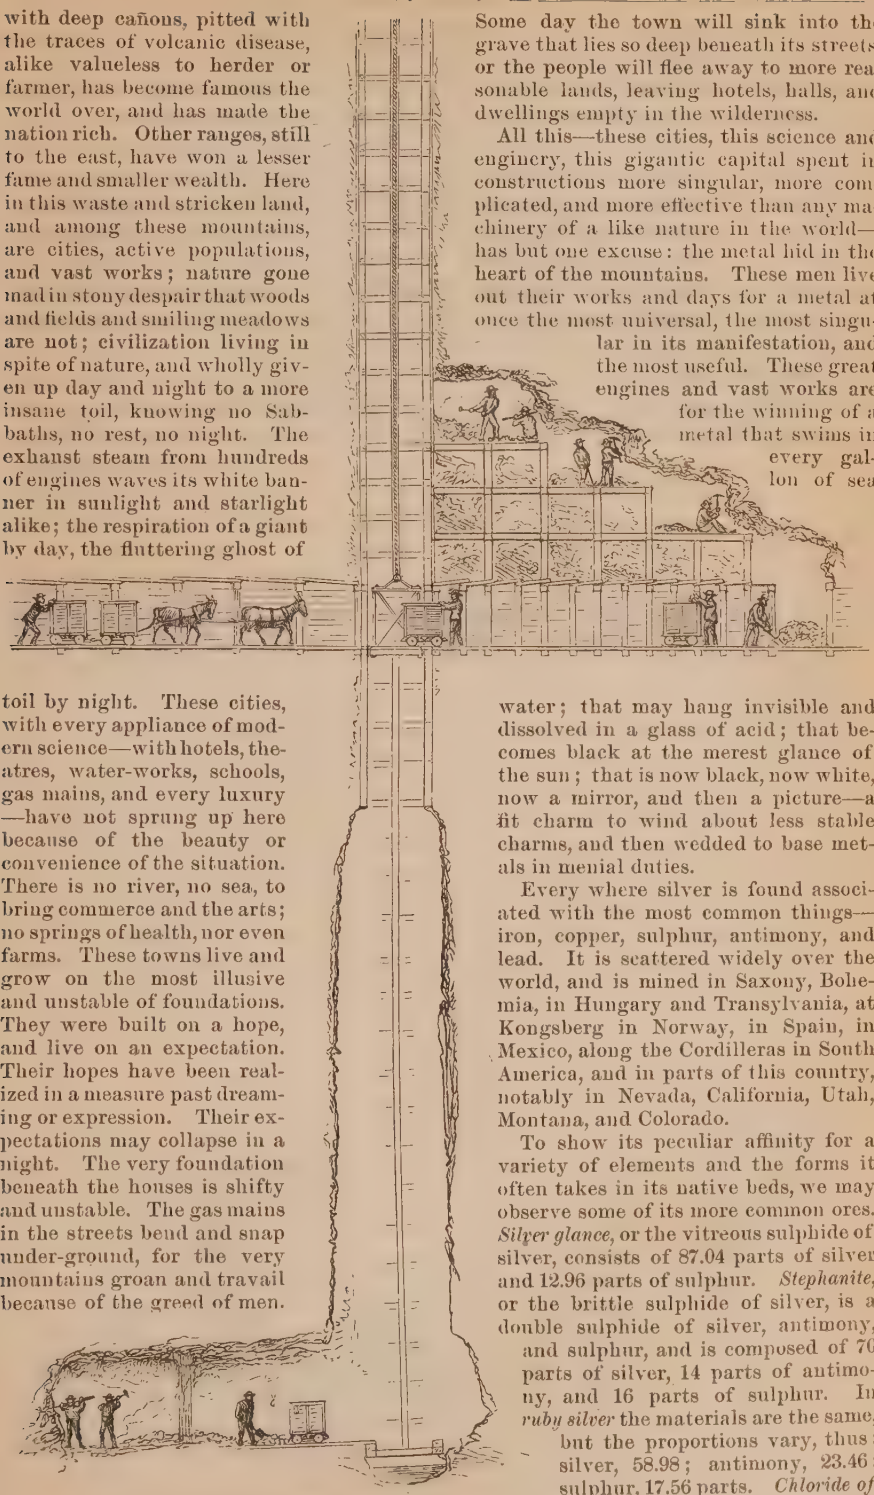


A TON OF SILVER.

The search for silver has in its story something deeply pathetic and melancholy. The history of its winning has been marked by wars, by slavery, cruel tasks, and immense disasters to whole states and nations. It shines, white and brilliant, on the table, but it has cost the blood of whole peoples.

OLD METHOD OF CRUSHING THE ORE.

Small wonder that it will turn black in the face in pure sunshine, for thinking of its price. It is only now that science and humane skill have come to its aid that silver mining is more than a grievous burden. Useful as silver has been in the arts and trades, it may still be doubted if, in a broad and humanitarian sense, it has been worth the price that has been paid for it up to the beginning of this century, or the price still paid for it in some countries. Certainly those countries that have had the most of it have been the most unhappy, and are to this day bearing the burden of its possession. Generations of slaves have died in toil, that the silver mines of old Europe might be worked. Mexico and South America have been ruined by ceaseless civil wars for the sole right to gather their wealth of silver. The greed for silver has compelled whole peoples to toil in the midst of dangers that the modern miner would resent as inhuman selfishness. To break out the stubborn rocks hundreds of feet below the ground with the most wretched tools and in insufficient light; to load the ores in bags and baskets on the backs of men and women, and to bear them up rough timbers rudely hacked into the semblance of a ladder; to be in constant danger of falling walls and rising water; to bear grievous burdens from place to place among cold mountains; to break up the stones with the hands, and mix the crushed ores with the naked feet—these things have been the lot of the silver winner. Silver is called a precious metal: at least it has cost blood and tears, and these are precious.

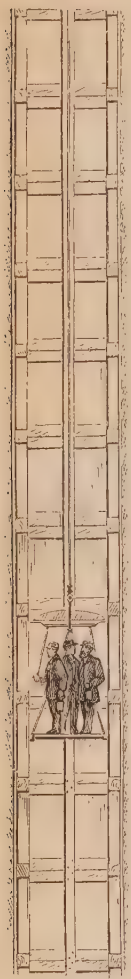


A TIMBERED GALLERY.

The Sierra Nevada Mountains, extending nearly north and south through Mexico and part of California and Nevada, look eastward over a vast basin, a waste and hungry land, treeless, stony, rumpled up here and there into mountain folds, or stretched out into naked plains and ghastly sinks, glistening with sand or white alkali. These mountains that stand in parallel rows, rough and fantastic in shape, stare in blank vacancy at the intense blue sky, and over the plains whirl spirals of alkali dust, uncanny ghosts in the bright sunshine.

One of these mountain ranges, looking west to the snow-capped Sierras, with their zones of black pines, and gazing at the glistening deserts on the east, split and torn

with deep cañons, pitted with the traces of volcanic disease, alike valueless to herder or farmer, has become famous the world over, and has made the nation rich. Other ranges, still to the east, have won a lesser fame and smaller wealth. Here in this waste and stricken land, and among these mountains, are cities, active populations, and vast works; nature gone mad in stony despair that woods and fields and smiling meadows are not; civilization living in spite of nature, and wholly given up day and night to a more insane toil, knowing no Sabbaths, no rest, no night. The exhaust steam from hundreds of engines waves its white banner in sunlight and starlight alike; the respiration of a giant by day, the fluttering ghost of toil by night. These cities, with every appliance of modern science—with hotels, theatres, water-works, schools, gas mains, and every luxury—have not sprung up here because of the beauty or convenience of the situation. There is no river, no sea, to bring commerce and the arts; no springs of health, nor even farms. These towns live and grow on the most illusive and unstable of foundations. They were built on a hope, and live on an expectation. Their hopes have been realized in a measure past dreaming or expression. Their expectations may collapse in a night. The very foundation beneath the houses is shifty and unstable. The gas mains in the streets bend and snap under-ground, for the very mountains groan and travail because of the greed of men.



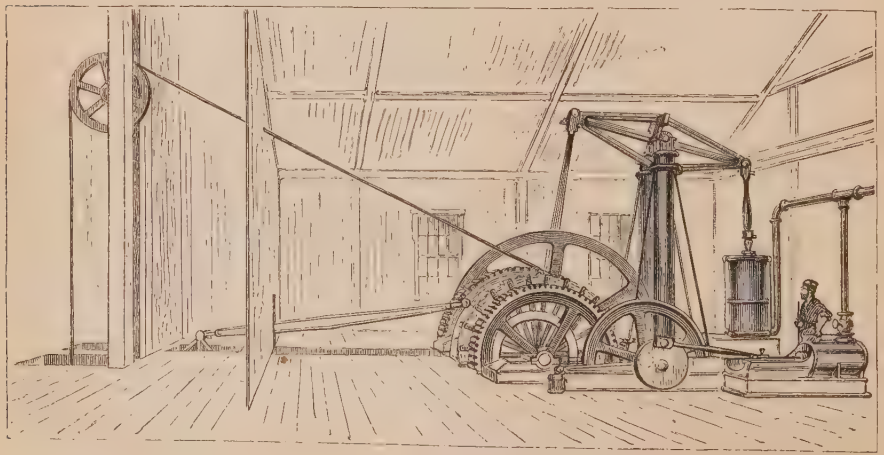
IDEAL SECTION OF A MINE.

Some day the town will sink into the grave that lies so deep beneath its streets, or the people will flee away to more reasonable lands, leaving hotels, halls, and dwellings empty in the wilderness.

All this—these cities, this science and enginery, this gigantic capital spent in constructions more singular, more complicated, and more effective than any machinery of a like nature in the world—has but one excuse: the metal hid in the heart of the mountains. These men live out their works and days for a metal at once the most universal, the most singular in its manifestation, and the most useful. These great engines and vast works are for the winning of a metal that swims in every gallon of sea water; that may hang invisible and dissolved in a glass of acid; that becomes black at the merest glance of the sun; that is now black, now white, now a mirror, and then a picture—a fit charm to wind about less stable charms, and then wedded to base metals in menial duties.

Every where silver is found associated with the most common things—iron, copper, sulphur, antimony, and lead. It is scattered widely over the world, and is mined in Saxony, Bohemia, in Hungary and Transylvania, at Kongsberg in Norway, in Spain, in Mexico, along the Cordilleras in South America, and in parts of this country, notably in Nevada, California, Utah, Montana, and Colorado.

To show its peculiar affinity for a variety of elements and the forms it often takes in its native beds, we may observe some of its more common ores. *Silver glance*, or the vitreous sulphide of silver, consists of 87.04 parts of silver and 12.96 parts of sulphur. *Stephanite*, or the brittle sulphide of silver, is a double sulphide of silver, antimony, and sulphur, and is composed of 70 parts of silver, 14 parts of antimony, and 16 parts of sulphur. In *ruby silver* the materials are the same, but the proportions vary, thus: silver, 58.98; antimony, 23.46; sulphur, 17.56 parts. *Chloride of silver*, or *horn silver*, consists of



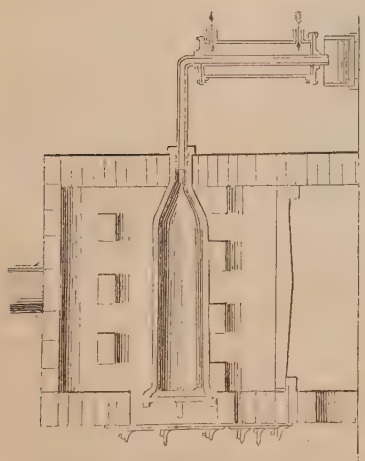
THE SHAFT.

75.33 parts of silver, 24.67 parts of chlorine. Besides these are other combinations of silver with other materials in greater or less degree, as in galena; but these are only called ores of silver when the silver, as in these ores, is largely in excess. Sea water contains silver; but so little is there in a gallon that it is unworthy of notice save as a curious fact showing the wide diffusion of the metal, for only when the combination contains enough silver to make it worth while to extract it from the matter with which it is united can the combined materials be called an ore.

Besides the ores of silver, are the native alloys, combinations of silver with gold or lead. Gold and silver are often combined in natural alloys, or silver with lead in close wedded unions, so that they may be called lead with silver and gold, or silver with gold. To examine and define these alloys is the work of the geologist. The ignorant prospecter wandering over the mountain-sides knew nothing of these things, and it was the geologist and metallurgist who discovered our wealth, and made the nation rich.

Silver, whether appearing in combination with sulphur, antimony, or chlorine, or alloyed with gold or lead, is said to "occur" in veins ("surely there is a vein for the silver")—deep fissures varying in width from mere films between the rocks to vast lodes, yards wide and thousands of feet long. Here brown and yellow, there black and bluish-black or red, rarely appearing in its metallic color, so that it is not surprising that ignorant prospecters seeking for gold threw the black stuff aside in unthinking wastefulness, neglecting tons of silver for a few ounces of gold. These veins, where the sulphides and chlorides of silver are scattered through the stony mass of the lode, have every imaginable pitch downward into the earth. The ores may be oxidized and stained at the surface, while below they may be in their native colors. The staining on the surface may trace the top of the mass; below, all is a blind guess. There is nothing to be done but to bore into the vein to find its path below.

Having found something concerning the position of the ore vein, the next step is to sink a shaft—a huge hole sunk vertically into the mountain. The ground about the top of the shaft may be rich in ores, but it must not be touched, as it is needed for a roof over the mine, and as a reserve when the treasure below is exhausted. Perhaps the boring has shown that the vein is near the side of the mountain, and that the shortest road to the lower masses of ore will be found by opening a tunnel horizontally into the hill-side. The most common method is to sink a shaft on or near the vein, and this decided upon, the immense outlay of labor and money begins. First, there must be power—a battery of steam-boilers brought at vast expense from distant cities into the wilderness. Then follow engines for hoisting and pumping, for sawing lumber and turning ventilating fans. There must be houses and shops,

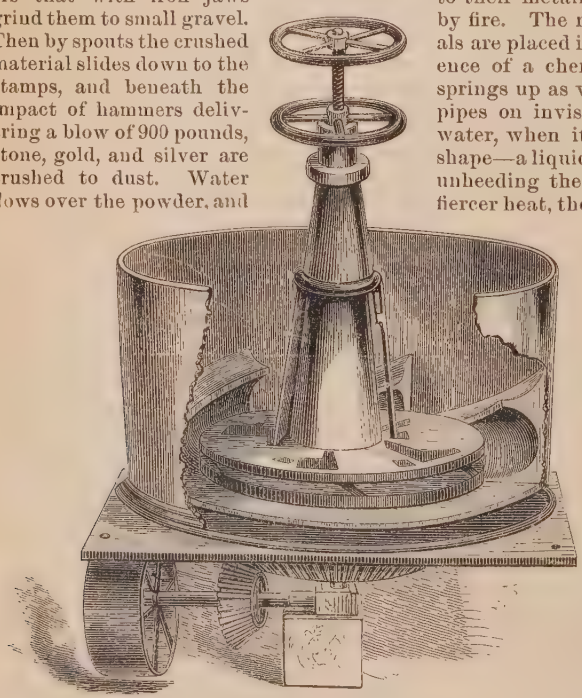


HOISTING AND PUMPING ENGINES.

mills and offices, furnaces, retorts, store-houses for chemicals, and homes for man and beast—in short, a town. There are often no trees in all the land, and distant mountains must be stripped of timber, and railroads must be laid to move it, that huge beams and logs be ready to line the shafts and deep galleries below. There must be gathered engineers, miners, carpenters, track-layers, surveyors, and clerks, and all these must be sheltered from the weather while at work. A comprehensive plan of the mining plant must be drawn, showing the position of the shaft, the engines, pumps, timber-yards, railways, counting-rooms, and mills—in brief, there must be a city in the wilderness.

TUNNELLING WITH A "POWER" DRILL.

The shaft having been sunk to the required depth, be it 500, 1000, or 1500 feet, and securely lined with timbers, the next step is to extend level galleries through the rock into what seem the most promising ores. Every yard of the passages must be propped with timbers, or the loosened rocks will fall in and block the way; tracks are laid along the levels, and on either side must be ways for the ever-flowing water. Then comes the winning, the digging out of the ore. This work is pushed upward from one level to another, the miner throwing the loosened material downward through wooden spouts or directly into the cars on the tracks below. Every variety of rock—now soft and powdery, like crushed sugar, and now so flinty that it must be blasted out with powder—is met: useless clays, barren rock, and rich ores mingled in endless confusion, and each must be separated, the ore sent up to daylight, and the waste material left to fill up the empty galleries below. The miner digs out a cave by tearing down the rocks above him, and immediately behind him come the carpenters with immense timbers already squared and fitted, so that a gigantic frame or house, piled floor above floor, may be erected to keep the two sides of the outraged vein from falling together in revengeful ruin. Intricate galleries, inclined planes from level to level, and complicated constructions fill all the space robbed of the ore, till whole forests are sunk in the ground. In narrower veins the miner abandons the empty cave to its fate, the mountain closes in on his work, the timbers sink into dusty powder under the awful pressure, and the startled land above gapes and yawns in mysterious seams and strange sinkings, as if its heart had broken. Even while the miner works, the mountain groans in pain. There are sighs and gasps, cries from the dumb rocks cheated of their treasures. If he stops and listens, the deep protest of the mountain against his theft will fill his ears with terrible sounds, and should he linger after the work is done, the eager rocks would grind him to dust, as they do the abandoned timbers. The treasure won, the caves fall in, more levels are run out, more caves are made, only to fall in at last, when the tale of the mine is told.



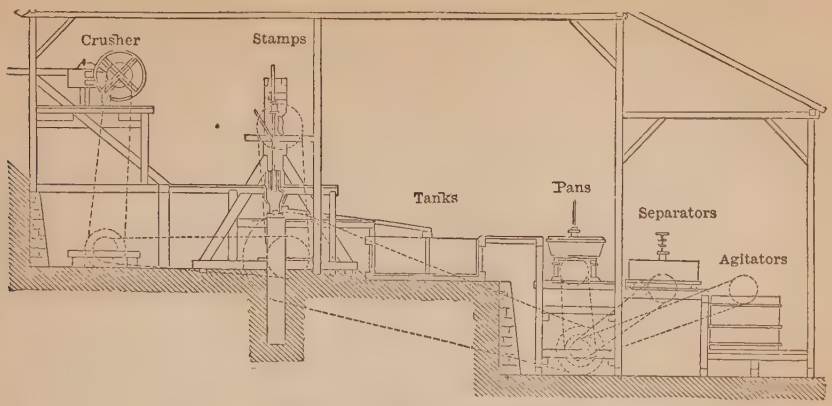
SECTION OF RETORT FURNACE.

The character of the ore and the rocks in which it may be bedded vary greatly, but the system of mining is essentially the same every where. The shaft with its various compartments, the winding engine, the pumping engines, the tram-way system above and below, and the ventila-

ting appliances must be employed in every case, and they must be at once safe, efficient, and economic. The cost of a mining plant is enormous, and unless it is the best of the kind, unless it saves labor and lives, it will never pay, even if the mine be a bonanza. The cheap and wasteful methods, neglectful alike of time, labor, and human life, so long in use, and still employed in some countries, will not answer for this country. Improved elevators, with every appliance for securing speed and safety, the most perfect ventilation, ample light, and even ice-water for thirsty laborers, are all good investments. The life below is, at best, full of toil and danger. It is but just that the barbaric methods of other times should give place to the more humane practice of Nevada.

Having with infinite labor won the ore from the lower deeps, then comes the wrenching apart of the metals, the divorce of silver from its base union with sulphur, lead, antimony, and useless stone. The character and value of the ores and alloys determine the process that must be employed, and may serve to illustrate the great variety of forms which silver may assume. Suppose it is an ore of silver containing a percentage of gold: the cars containing the mingled stone and metals rise swiftly in the shaft and roll out on a platform at the top of the silver mill, and are there dumped into bins or spouts leading directly to the stone-crushers that with iron jaws grind them to small gravel. Then by spouts the crushed material slides down to the stamps, and beneath the impact of hammers delivering a blow of 900 pounds, stone, gold, and silver are crushed to dust. Water flows over the powder, and sweeps it away in a stream heavy with the white sediment. The water, with the crushed material in mechanical suspension, flows into huge tanks, there to settle, so that the surplus water may be drawn off, leaving the suspended matter to gather in white slime in the tanks. The next step in the process is the grinding and amalgamating in circular tanks. Iron pans with movable bottoms revolve swiftly by steam-power, and grind the slime to still finer powder. Quicksilver, salt, and sulphate of copper are added to the slime as it is grinding. Hot steam comes to add heat and turmoil to the boiling mass, and the strange loves of the metals begin. The silver and gold part with their original forms, and in chemic union with the mercury are lost to sight and touch. Then the white sirup-like material flows on downward to other tanks, there to settle and cool, the water to flow away, taking with it the light flour-like quartz, the mingled metals to sink to the bottom by their own gravity. At last the product may be gathered up in canvas bags, and, on submitting these to pressure, a portion of the quicksilver trickles through the fabric in silvery tears—literally a "quick" or live metal. The rest, still stubbornly clinging to its treasures, remains behind: a curious pasty mass, resembling neither gold, silver, nor mercury.

How can we win back the silver and gold to their metallic state? Let them be torn by fire. The mingled quicksilver and metals are placed in retorts, and under the influence of a cherry-red heat the quicksilver springs up as vapor and flies away through pipes on invisible wings, till it meets cold water, when it freezes again to its normal shape—a liquid metal. The precious metals, unheeding the fire, remain behind till, in a fiercer heat, they flow together in solid bars.

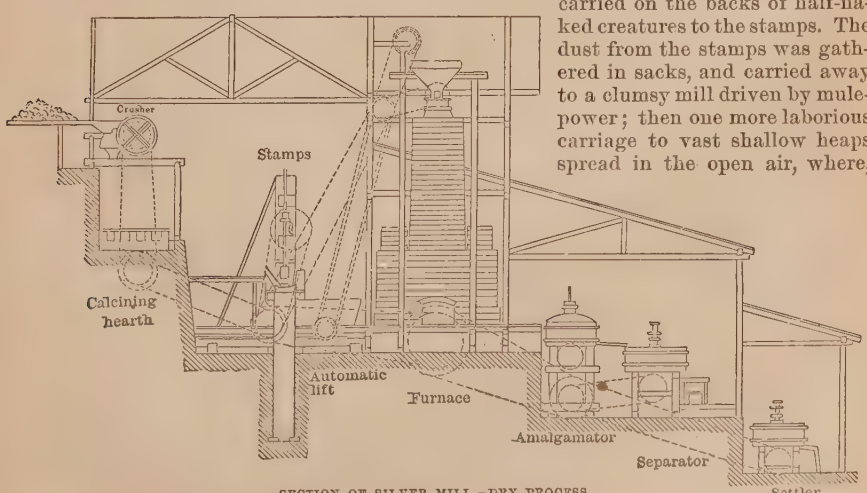


AMALGAMATING PAN.

The figure at top of next page is an ideal section of a silver mill where ores and alloys are treated by this process, and shows the position of the crushing machinery, the stamps, the amalgamating and settling pans, and all the steps of the process up to the retorting of the quicksilver.

The figure on this page gives one of the amalgamating pans, and aptly shows the perfection of the machinery employed in this work.

This process, as it uses water, is known as the "wet process." Other ores and alloys containing sulphur demand the use of fire to drive out the sulphur, and the



SECTION OF SILVER MILL—WET PROCESS.

figure below gives a section of a silver mill using what is called the "dry process."

Here the crude ore is given to the crusher (shown at the left), where it is reduced to a coarse gravel. It then falls through the floor to the kilns below, where, over the brick flues, it is gently roasted; salt is at the same time added, and, when properly roasted, the mingled salt and ores are raked away to the automatic feeders that supply it to the stamps. The fine dust that comes from the stamps is raised by the elevators to the top of the furnace, or stack, and is there sifted downward through the upspringing flames, and at last raked out below in a new form. Sometimes, in place of the upright stack, a revolving furnace is employed, but in either case the object is the same. In the furnace or stack appears one of those mystic divorces and remarriages which the elements so readily assume when provoked by fire. The sulphur wedded to the silver seeks the salt. The chlorine that, joined to the sodium, made the salt, deserts its lover, and seeks the more precious silver. The double parting and remarriage is consummated in a salt of silver or chlorate of silver, while sulphate of soda represents the other pair. Both pass out of the fire that has separated and reunited them in new bonds, and in the amalgamating pans the silver loses itself in a new embrace with the mercury, and the baser couple are cast out—a degenerate pair, fit only to be trodden under foot of men. At last, in the retort, fire again separates the silver from the mercury, and it resumes the virgin shape that it had before the mountains were brought forth.

In contrast with all this science, this use of enormous capital in power and machinery, are the wasteful and cruel methods of the past. When from a rude hole in the ground the ores were brought up in sacks on the backs of men and women, convicts under the stress of ever-loaded cannon, or slaves in fear of the lash, broke up the ore by hand with rude hammers in the remorseless sunshine or freezing wind from the mountains. Then, in bags, the broken material was again carried on the backs of half-naked creatures to the stamps. The dust from the stamps was gathered in sacks, and carried away to a clumsy mill driven by mule-power; then one more laborious carriage to vast shallow heaps spread in the open air, where,

SECTION OF SILVER MILL—DRY PROCESS.

after salt, magistral, and quicksilver had been added, mules blinded for the work, or men with naked feet, tramped over the crushed ore day after day for weeks, till the silver had united with the mercury. At last the slow process came to an end, and with still greater toil the amalgam was washed in tubs to free it from the useless quartz; then came the straining in canvas bags to extract the free quicksilver, and the amalgam was ready for the retort. This was merely a "capella," or bell of iron, that with much labor was placed over a heap of the amalgam. About the capella was built a brick furnace in which a fire could be maintained, and the mercury, vaporized in the heat, trickled down the inside of the bell into a basin of water, where it was condensed, leaving the silver in a frosty, glistening mass under the capella. If our improved processes with all the aids of science and skill still let slip a large percentage of the metals, how wasteful was this older process, not only in precious metals, but in time, labor, and human lives!

The records of the United States Patent-office show more than two hundred patented "processes" for recovering silver and gold from their ores and alloys. These that have been briefly described are among the most important. In separating silver from its alloys of lead or gold still other methods are employed, equally intricate and equally expensive. When silver is wedded to lead, the smelting-works must be employed. Fluxes must be mingled with the alloy, that, when fire comes to test them, new forms shall arise. The useless oxides and sulphides unite with the flux to make glassy slags, and the lead and silver form a metallic combination, the lead greedily absorbing every grain and speck of silver scattered through the crushed ore, and gathering it in a mass below the slag. Then comes one of those strange partings that even the ancient poets caught up as brilliant metaphors. The mingled lead and silver are placed on a porous bed of bone ash called a "cupel," where fire and air may play upon them; and in the rosy glow the baser lead steals away in ruddy shame, leaving its silver heart behind. As the lead oxidizes it sinks into the porous cupel on which it rests, till suddenly the mass "brightens," grows brilliant in prismatic colors, and the silver shines more glorious in native purity.

Another divorce of the alloys shows a sharper trial and more poetic parting, as when gold and silver beaten by hammers into a sheet are plunged in boiling acid. The silver dissolves in the limpid acid—seeks apparent extinction in the embrace of its fiercer lover; and the gold, resisting the onset of the acid, remains behind, a colder virgin, torn, distracted, but absolutely pure. The acid, clear and limpid, holds the silver fast till in new reactions the silver escapes and re-appears, first as a filmy dust, and finally as solid metal.

Mexico, British Columbia, and the United States produced in 1877 precious metals to the value of $98,421,754. Of this grand total our share was $95,811,563. The sole and only sources of wealth are the ground and the sea. In the immense activities of our commerce and manufactures it often happens that we forget that it is the fisherman, the farmer, and the miner who create wealth. These millions, won with such magnificent skill from the treasure-house of the mountains, are new millions. The nation is so much the richer, so much the better able to pay its debts, and to buy books, the products of the arts, and all goodly things which the older nations may have to sell. All the people share in these fresh millions. The first hands that hold the prizes may excite envy by reason of their foolish pride; but a higher power holds them in derision, for they are but the wardens of the people's wealth, and in the feebler hands of their children's children it slips away with the nimble speed of quicksilver. In pride they call themselves the "bonanza kings," but their sons and grandsons scatter their wealth among the people, where it belongs. These millions, won so splendidly, are quickly spent. The mines are God's dower to the nation. Let us see that it be wisely used.

THE CHILDREN!

The children! ah, the children!
Your innocent, joyous ones;
Your daughters, with souls of sunshine;
Your buoyant and laughing sons.

Look long in their happy faces,
Drink love from their sparkling eyes,
For the wonderful charm of childhood,
How soon it withers and dies!

A few fast-vanishing summers,
A season or twain of frost,
And you suddenly ask, bewildered,
"What is it my heart hath lost?"

Perchance you see by the hearth-stone
Some Juno, stately and proud,
Or a Hebe, whose softly ambushed eyes
Flash out from the golden cloud

Of lavish and beautiful tresses
That, wantonly floating, stray
O'er the white of a throat and bosom
More fair than blossoms in May.

And perchance you mark their brothers—
Young heroes who spurn the sod
With the fervor of antique knighthood,
And the air of a Grecian god.

But where, ah, where are the children,
Your household fairies of yore?
Alack! they are dead, and their grace has fled
For ever and evermore!

THE RETURN OF THE NATIVE.

BOOK FIFTH.

Contains the natural effects of the foregoing misadventure, namely, contrition in one quarter; in another, an awakening to harrowing discoveries; hasty action thereupon; and what ensued before milder intentions could take effect.

CHAPTER V.

AN OLD MOVE INADVERTENTLY REPEATED.

CHARLEY'S attentions to his former mistress were unbounded. The only solace to his own trouble lay in his attempts to relieve hers. Hour after hour he considered her wants: he thought of her presence there with a sort of gratitude, and, while uttering imprecations on the cause of her unhappiness, in some measure blessed the result. Perhaps she would always remain there, he thought, and then he would be as happy as he had been before. His dread was lest she should think fit to return to Alderworth, and in that dread his eyes, with all the inquisitiveness of affection, frequently sought her face when she was not observing him, as he would have watched the head of a stock-dove to learn if it contemplated flight. Having once really succored her, and possibly preserved her from the rashest of acts, he mentally assumed in addition a guardian's responsibility for her welfare.

For this reason he busily endeavored to provide her with pleasant distractions, bringing home curious objects which he found in the heath, such as white trumpet-shaped mosses, red-headed lichens, stone arrow-heads used by the old tribes on Egdon, and faceted crystals from the hollows of flints. These he deposited on the premises in such positions that she should see them as if by accident.

A week passed, Eustacia never going out of the house. Then she walked into the inclosed plot and looked through her grandfather's spy-glass as she had been in the habit of doing before her marriage. One day she saw, at a place where the high-road crossed the distant valley, a heavily laden wagon passing along. It was piled with household furniture. She looked again and again, and recognized it to be her own. In the evening her grandfather came in-doors with a rumor that Yeobright had removed that day from Alderworth to the old house at Blooms End.

On another occasion when reconnoitring thus she beheld two female figures walking in the vale. The day was fine and clear, and the persons being not more than half a mile off, she could see their every detail with the telescope. The woman walking in front carried a white bundle in her arms, from one end of which hung a long appendage of drapery; and when the walkers turned, so that the sun fell more directly upon them, Eustacia could see that the object was a baby. She called Charley, and asked him if he knew who they were, though she well guessed.

"Mrs. Wildeve and the nurse-girl," said Charley.

"The nurse is carrying the baby?" said Eustacia.

"No, 'tis Mrs. Wildeve carrying that," he answered, "and the nurse walks behind, carrying nothing."

The lad was in good spirits that day, for the fifth of November had again come round, and he was planning yet another scheme to divert her from her too absorbing thoughts. For two successive years his mistress had seemed to take pleasure in lighting a bonfire on the bank overlooking the valley; but this year she had apparently quite forgotten the day and the customary deed. He was careful not to remind her, and went on with his secret preparations for a cheerful surprise, the more zealously that he had been absent last time and unable to assist. At every vacant minute he hastened to gather furze stumps, thorn-tree roots, and other solid materials from the adjacent slopes, hiding them from cursory view.

The evening came, and Eustacia was still seemingly unconscious of the anniversary. She had gone in-doors after her survey through the glass, and had not been visible since. As soon as it was quite dark Charley began to build the bonfire, choosing precisely that spot on the bank which Eustacia had chosen at previous times.

When all the surrounding bonfires had burst into existence Charley kindled his, and arranged its fuel so that it should not require tending for some time. He then went back to the house, and lingered round the door and windows till she should by some means or other learn of his achievement, and come out to witness it. But the shutters were closed, the door remained shut, and no heed whatever seemed to be taken of his performance. Not liking to call her, he went back and replenished the fire, continuing to do this for more than half an hour. It was not till his stock of fuel had greatly diminished that he went to the back-door and sent in to beg that Mrs. Yeobright would open the window-shutters and see the sight outside.

Eustacia, who had been sitting listlessly in the parlor, started up at the intelligence,

and flung open the shutters. Facing her on the bank blazed the fire, which at once sent a ruddy glare into the room where she was, and overpowered the candles.

"Well done, Charley!" said Captain Drew, from the chimney-corner. "But I hope it is not my wood that he's burning. . . . Ah, it was this time last year that I met with that man Venn, bringing home Thomasin Yeobright—to be sure it was! Well, who would have thought that girl's troubles would have ended so well? What a snipe you were in that matter, Eustacia! Has your husband written to you yet?"

"No," said Eustacia, looking vaguely through the window at the fire, which just then so much engaged her mind that she did not resent her grandfather's blunt opinion. She could see Charley's form on the bank, shovelling and stirring the fire; and there flashed upon her imagination some other form which that fire might call up.

She left the room, put on her garden bonnet and cloak, and went out. Reaching the bank, she looked over with a mild curiosity, when Charley said to her, with a pleased sense of himself, "I made it o' purpose for you, ma'am."

"Thank you," she said, hastily. "But I wish you to put it out now."

"It will soon burn down," said Charley, rather disappointed. "Is it not a pity to knock it out?"

"I don't know," she musingly answered.

They stood in silence, broken only by the crackling of the flames, till Charley, perceiving that she did not want to talk to him, moved reluctantly away.

Eustacia remained within the bank, looking at the fire, intending to go in-doors, yet lingering still. Had she not by her situation been inclined to hold in indifference all things honored of the gods and of men, she would probably have come away. But her state was so hopeless that she could play with it. To have lost is less disturbing than to wonder if we may possibly have won; and Eustacia could now, like other people at such a stage, take a standing-point outside herself, observe herself as a disinterested spectator, and think what a sport for Heaven this woman Eustacia was.

While she stood she heard a sound. It was the splash of a stone in the pond.

Had Eustacia received the stone full in the bosom, her heart could not have given a more decided thump. She had thought of the possibility of such a signal in answer to that which had been unwittingly given by Charley, but she had not expected it yet. How prompt Wildeve was! Yet how could he think her capable of deliberately wishing to renew their assignations now? An impulse to leave the spot, a desire to stay, struggled within her; and the desire held its own. More than that it did not do, for she refrained even from ascending the bank and looking over. She remained motionless, not disturbing a muscle of her face or raising her eyes; for were she to turn up her face, the fire on the bank would shine upon it, and Wildeve might be looking down.

There was a second splash into the pond.

Why did he stay so long without advancing and looking over? Curiosity had its way: she ascended one or two of the earth steps in the bank, and glanced out.

Wildeve was before her. He had come forward after throwing the last pebble, and the fire now shone into each of their faces from the bank stretching breast-high between them.

"I did not light it!" cried Eustacia, quickly. "It was lit without my knowledge. Don't, don't come over to me."

"Why have you been living here all these days without telling me? You have left your home. I fear I am something to blame in this."

"I did not let in his mother; that's how it is."

"You do not deserve what you have got, Eustacia. You are in great misery; I see it in your eyes, your mouth, and all over you. My poor, poor girl!" He stepped over the bank. "You are beyond every thing unhappy."

"No, no! not exactly—"

"It has been pushed too far—it is killing you; I do think it."

Her usually quiet breathing had grown quicker with his words. "I—I—" she began, and then burst into quivering sobs, shaken to the heart by the unexpected voice of pity—a sentiment whose existence in relation to herself she had almost forgotten.

This outbreak of weeping took Eustacia herself so much by surprise that she could not leave off, and she turned aside from him in some shame, though turning hid nothing from him. She sobbed on desperately; then the outpour lessened, and she became quieter. Wildeve had stood without speaking.

"Are you not ashamed of me, who used never to be a crying animal?" she asked, in a weak whisper, as she wiped her eyes. "Why didn't you go away? I wish you had not seen quite all that; it reveals too much by half."

"You might have wished it because it makes me as sad as you," he said, with emotion and with deference. "As for revealing, the word is impossible between us two."

"I did not send for you—don't forget it, Damon; I am in pain, but I did not send for you."

"Never mind—I came. Oh, Eustacia, forgive me for the harm I have done you in these two past years! I see more and more that I have been your ruin."

"Not you. This place I live in."

"Ah, your generosity may naturally make you say that. But I am the culprit. I should either have done more, or nothing at all."

"In what way?"

"I ought never to have hunted you out; or, having done it, I ought to have persisted in marrying you. But of course I have no right to talk of that now. I will only ask this: Can I do any thing for you? Is there any thing on the face of the earth that a man can do to make you happier than you are at present? If there is, I will do it. You may command me, Eustacia, to the limit of my influence; and don't forget that I am richer now. Surely something can be done to save you from this! Such a rare plant in such a wild place it grieves me to see. Do you want any thing bought? Do you want to go any where? Do you want to escape the place altogether? Only say it, and I'll do any thing to put an end to those tears, which but for me would never have been at all."

"We are each married to another person," she said, faintly; "and assistance from you, however correct, would have an evil sound."

"Well, there's no preventing slanderers from having their fill at any time; but as there will be no evil in it, you need not be afraid. I believe I am now a sobered man, and whatever I may feel, I promise you on my word of honor never to speak to you about—what might have been. Thomasin is helplessly dependent on me now, and I know my duty to her quite as well as I know my duty to you as a woman unfairly treated. I will assist you without prejudice to her. What shall I assist you in?"

"In getting away from here."

"Where do you wish to go?"

"I have a place in my mind. If you could help me as far as Budmouth, I can do all the rest. Steamers sail from there. Yes," she pleaded, earnestly; "help me to get to Budmouth Harbor without my grandfather's or my husband's knowledge, and I can do all the rest."

"Will it be safe to leave you there alone?"

"Yes, yes. I know Budmouth well."

"Then let me know when you wish to go. We shall be at our present house till December; after that we remove to Southerton. Command me in any thing till that time."

"I will think of this," she said, hurriedly. "Whether I can honestly make use of you as a friend—that is what I must ask myself. If I wish to go, and decide to accept your assistance, I will signal to you some evening at eight o'clock punctually, and this will mean that you are to be ready with a horse and trap at twelve o'clock the same night to drive me to Budmouth Harbor in time for the morning boat."

"I will look out every night at eight, and no signal shall escape me."

"Now please go away. I can only meet you once more under any circumstances, and that will be if I decide on this escape. After that I shall never see you again; and you must do your best to forget an unhappy exile. Go—I can not bear it longer. Go—go."

Wildeve slowly went up the steps, and descended on the other side; and as he walked he glanced back, till the bank blotted out her form from his further view.

CHAPTER VI.

THOMASIN ARGUES WITH HER COUSIN, AND HE WRITES A LETTER.

Yeobright was at this time at Blooms End, hoping that Eustacia would return to him. The removal of furniture had been accomplished only that day, though Clym had lived in the old house for more than a week. He had spent the time in working about the premises, sweeping leaves from the garden paths, cutting dead stalks from the flower beds, and nailing up creepers which had been displaced by the autumn winds. He took no particular pleasure in these deeds, but they formed a screen between himself and despair. Moreover, it had become a religion with him to preserve in good condition all that had lapsed from his mother's hands to his own.

During these operations he was constantly on the watch for Eustacia. That there should be no mistake about her knowing where to find him, he had ordered a notice board to be affixed to the garden gate at Alderworth, signifying in white letters whither he had removed. When a leaf floated to the earth he turned his head, thinking it might be her footfall. A bird searching for worms in the mould of the flower beds sounded like her hand on the latch of the gate; and at dusk, when soft strange ventriloquisms come from holes in the ground, hollow stalks, curled dead leaves, and other crannies wherein breezes, worms, and insects can work their will, he fancied that they were Eustacia, standing without and breathing wishes of reconciliation.

Up to this time he had persevered in his resolve not to invite her back. At the same time the severity with which he had treated her lulled the sharpness of his regret for his mother, and awoke some of his old solicitude for his mother's supplanter. Harsh feelings produce harsh usage, and this by reaction quenches the sentiments that gave it birth. The more he reflected, the more he softened. But to look upon his wife as innocence in distress was impossi-

ble, though he could ask himself whether he had given her quite time enough—if he had not come a little too suddenly upon her on that sombre morning.

Now that the first flush of his anger had paled, he was disinclined to ascribe to her more than an indiscreet friendship with Wildeve, for there had not appeared in her manner the signs of dishonor; so that the absolutely dark character of her deed could scarcely be maintained after making such an admission as this.

On the evening of the fifth of November his thoughts of Eustacia were intense. Echoes from those past times when they had exchanged tender words all the day long came like the diffused murmur of a seashore left a mile behind. "Surely," he said, "she might have brought herself to communicate with me before now."

Instead of remaining at home that night, he determined to go and see Thomasin and her husband. If he found opportunity, he would allude to the chief cause of the separation between Eustacia and himself, keeping silence on the fact that there was a third person in the house when his mother was turned away. If it proved that Wildeve was innocently there, he would doubtless openly mention it. If he were there with unjust intentions, Wildeve, being a man of quick feeling, might possibly say something to reveal the extent to which Eustacia was compromised.

But on reaching his cousin's house he found that only Thomasin was at home, Wildeve being at that time on his way toward the bonfire unwittingly lit by Charley at Mistover. Thomasin, then as always, was glad to see Clym, and took him to inspect the sleeping baby, carefully screening the candle-light from the infant's eyes with her hand.

"Tamsin, have you heard that Eustacia is not with me now?" he said, when they had sat down again.

"No," said Thomasin, alarmed.

"And not that I have left Alderworth?"

"No. I never hear tidings from Alderworth unless you bring them. What is the matter?"

Clym in a disturbed voice related to her his visit to Susan Nunsuch's boy, the revelation he had made, and what had resulted from his charging Eustacia with having willfully and heartlessly done the deed. He suppressed all mention of Wildeve's presence with her.

"All this, and I not knowing it!" murmured Thomasin, in an awe-struck tone. "Terrible! What could have made her—oh, Eustacia! And when you found it out you went in hot haste to her? Were you too cruel?—or is she really so wicked as she seems?"

"Can a man be too cruel to his mother's enemy?"

"I can fancy so."

"Very well, then—I'll admit that he can. But now what is to be done?"

"Make it up again—if a quarrel so deadly can ever be made up. I almost wish you had not told me. But do try to be reconciled. There are ways, after all, if you both wish to."

"I don't know that we do both wish to make it up," said Clym. "If she had wished it, would she not have sent to me by this time?"

"You seem to wish to, and yet you have not sent to her."

"True; but I have been tossed to and fro in doubt if I ought, after such strong provocation. To see me now, Thomasin, gives you no idea of what I have been; of what depths I have descended to in these few last days. Oh, it was a bitter shame to shut out my mother like that! Can I ever forget it, or even agree to see her again?"

"She might not have known that any thing serious would come of it, and perhaps she did not mean to keep aunt out altogether."

"She says herself that she did not. But the fact remains that keep her out she did."

"Believe her sorry, and send for her."

"How if she will not come?"

"It will prove her guilty, by showing that it is her habit to nourish enmity. But I do not think that for a moment."

"I will do this: I will wait a day or two longer—not longer than two days certainly—and if she does not send to me in that time, I will indeed send to her. I thought to have seen Wildeve here to-night. Is he from home?"

Thomasin blushed a little. "No," she said; "he is merely gone out for a walk."

"Why didn't he take you with him—the evening is fine? You want fresh air as well as he."

"Oh, I don't care for going any where; besides, there is baby."

"Yes, yes. Well, I have been thinking whether I should not consult your husband about this as well as you," said Clym, steadily.

"I fancy I would not," she quickly answered. "It can do no good."

Her cousin looked her in the face. No doubt Thomasin was ignorant that her husband had any share in the events of that tragical afternoon; but her countenance seemed to signify that she concealed some suspicion or thought of the reputed tender relations between Wildeve and Eustacia in days gone by.

Clym, however, could make nothing of it, and he rose to depart more in doubt than when he came.

"You will write to her in a day or two?" said the young woman, earnestly. "I do so hope the wretched separation may come to an end."

"I will," said Clym: "I don't rejoice in my present state at all."

And he left her, and climbed the hills to Blooms End. Before going to bed he sat down and wrote the following letter:

"My dear Wife Eustacia,—I must obey my heart without consulting my reason too closely. Will you come back to me? Do so, and the past shall never be mentioned. I was too severe; but, oh, Eustacia, the provocation! You don't know, you never will know, what those words of anger cost me which you drew down upon yourself. All that an honest man can promise you I promise now, which is that from me you shall never suffer any thing on this score again. After all the vows we have made, Eustacia, I think we had better pass the remainder of our lives in trying to keep them. Come to me, then, even if you reproach me. I have thought of your sufferings that morning on which I parted from you; I know they were genuine, and they are as much as you ought to bear. Our love must still continue. Such hearts as ours would never have been given us but to be concerned with each other. I could not ask you back at first, Eustacia, for I was unable to persuade myself that he who was with you was not there as a lover. But if you will come, and explain distracting appearances, I do not question that you can show your honesty to me. Why have you not come before? Do you think I will not listen to you? Surely not, when you remember the kisses and vows we exchanged under the summer moon. Return, then, and you shall be warmly welcomed. I can no longer think of you to your prejudice; I am but too much absorbed in justifying you.

"Your husband as ever, Clym."

"There," he said, as he laid it in his desk, "that's a good thing done. If she does not come before to-morrow night, I will send it to her."

Meanwhile at the house he had just left Thomasin sat sighing uneasily. Fidelity to her husband had that evening induced her to conceal all suspicion that Wildeve's interest in Eustacia had not ended with his marriage. But she knew nothing positive; and though Clym was her well-beloved cousin, there was one nearer to her still.

When, a little later, Wildeve returned from his walk to Mistover, Thomasin said, "Damon, where have you been? I was getting quite frightened, and thought you had fallen into the river. I dislike being in the house by myself."

"Frightened?" he said, touching her cheek as if she were some domestic animal. "Why, I thought nothing could frighten you. It is that you are getting proud, I am sure, and don't like living here since we have risen above our business. Well, it is a tedious matter this getting a new house; but I couldn't have set about it sooner, unless our ten thousand pounds had been a hundred thousand, when we could have afforded to despise caution."

"No, I don't mind waiting. I would rather stay here twelve months longer than run any risk with baby. But I don't like your vanishing so in the evenings. There's something on your mind—I know there is, Damon. You go about so gloomily, and look at the heath as if it were somebody's jail instead of a nice wild place to walk in."

He looked toward her with pitying surprise. "What, do you like Egdon Heath?" he said.

"I like what I was born near to; I admire its grim old face."

"Pooh, my dear. You don't know what you like."

"I am sure I do. There's only one thing unpleasant about Egdon."

"What's that?"

"You never take me with you when you walk there. Why do you wander so much in it yourself if you so dislike it?"

The inquiry, though a simple one, was plainly disconcerting, and he sat down before replying. "I don't think you often see me there. Give an instance."

"I will," she answered, triumphantly. "When you went out this evening, I thought that as baby was asleep I would see where you were going to so mysteriously without telling me. So I ran out, and followed behind you. You stopped at the place where the road forks, looked round at the bonfires, and then said, 'Damn it, I'll go!' And you went quickly up the left-hand road. Then I stood and watched you."

Wildeve frowned, afterward saying, with a forced smile, "Well, what wonderful discovery did you make?"

"There, now you are angry, and we won't talk of this any more." She went across to him, sat on a footstool, and looked up in his face.

"Nonsense!" he said; "that's how you always back out. We will go on with it now we have begun. What did you next see?—I particularly want to know."

"Don't be like that, Damon," she murmured. "I didn't see any thing. You vanished out of sight, and then I looked round at the bonfires and came in."

"Perhaps this is not the only time you have dogged my steps. Are you trying to find out something bad about me?"

"Not at all. I have never done such a thing before, and I shouldn't have done it now if words had not sometimes been dropped about you."

"What *do* you mean?" he impatiently asked.

"They say—they say you used to go to Alderworth in the evenings, and it puts into my mind what I have heard about—"

Wildeve turned angrily, and stood up in front of her. "Now," he said, flourishing his hand in the air, "just out with it, madam. I demand to know what remarks you have heard."

"Well, I heard that you used to be very fond of Eustacia—nothing more than that, though told more in a bit-by-bit way. You ought not to be angry."

He observed that her eyes were brimming with tears. "Well," he said, "there is nothing new in that, and of course I don't mean to be rough toward you, so you need not cry. Now don't let us speak of the subject any more."

And no more was said, Thomasin being glad enough of a reason for not mentioning Clym's visit to her that evening, and his story.

CHAPTER VII.

A NIGHT WHICH BROUGHT NO REST.

Having resolved on flight, Eustacia at times seemed anxious that something should happen to thwart her own intention. The only event that could really change her position was the appearance of Clym. The glory which had encircled him as her lover was departed now; yet some good simple quality of his would occasionally return to her memory, and stir a momentary throb of hope that he would again present himself before her. But, calmly considered, it was not likely that such a severance as now existed would ever close up: she would have to live on as a painful object, isolated, and out of place. She had used to think of the heath alone as an uncongenial environment; she felt it now of the whole world.

Toward evening her determination to go away again revived. About four o'clock she packed up anew the few small articles she had brought in her flight from Alderworth, and also some belonging to her which had been left there: the whole formed a bundle not too large to be carried in her hand for a distance of a mile or two. The scene without grew darker; mud-colored clouds bellied downward from the sky like vast hammocks slung across it, and with the increase of night a stormy wind arose; but as yet there was no rain.

Eustacia could not rest in-doors, having nothing more to do, and she wandered to and fro on the hill, not far from the house that she was soon to leave. In these desultory ramblings she passed the cottage of Susan Nunsuch, a little lower down than her grandfather's. The door was ajar, and a ribbon of bright fire-light fell across the ground without. As Eustacia crossed the fire-beams she appeared for an instant as distinct as a figure in a phantasmagoria—a creature of light surrounded by an area of darkness: the moment passed, and she was absorbed in night again.

A woman who was sitting inside the cottage had seen and recognized her in that momentary irradiation. This was Susan herself, occupied in preparing a posset for her little boy, who, often ailing, was now seriously unwell. Susan dropped the spoon, shook her fist at the vanished figure, and then proceeded with her work in a musing, absent way.

At eight o'clock, the hour at which Eustacia had promised to signal to Wildeve, if ever she signaled at all, she looked around the premises to learn if the coast was clear, went to the furze rick, and pulled thence a long-stemmed bough of that fuel. This she carried to the corner of the bank, and, glancing behind to see if the shutters were all closed, she struck a light and kindled the furze. When it was thoroughly ablaze Eustacia took it by the stem, and waved it in the air above her head till it had burned itself out.

She was gratified, if gratification were possible to such a mood, by seeing a similar light in the vicinity of Wildeve's residence a minute or two later. Having agreed to keep watch at this hour every night in case she should require assistance, this promptness proved how strictly he had held to his word. Four hours after the present time—that is, at midnight—he was to be ready to drive her to Budmouth as pre-arranged.

Eustacia returned to the house. Supper having been got over, she retired early, and sat in her room waiting for the time to go by. The night being dark and threatening, Captain Drew had not strolled out to gossip in any cottage, or to call at the inn, as was sometimes his custom on these long autumn nights; and he sat sipping grog alone down stairs. About ten o'clock there was a knock at the door. When the servant opened it, the rays of the candle fell upon the form of Fairway.

"I was a-forced to go to Lower Mistover to-night," he said, "and Mr. Yeobright asked me to leave this here on my way; but, faith, I put it in the lining of my hat, and thought no more about it till I got back and was hasping my gate before going to bed. So I have run back with it at once."

He handed in a letter, and went his way. The girl brought it to the captain, who found that it was directed to Eustacia. He turned it over and over, and fancied that the writing was her husband's, though he could not be sure. However, he decided to let her have it at once if possible, and took it up stairs for that purpose; but on reaching the door of her room and looking in at the key-hole, he found there was no light

within, the fact being that Eustacia, without undressing, had flung herself upon the bed, to rest and gather a little strength for her coming journey. Her grandfather concluded from what he saw that he ought not to disturb her, and descending again to the parlor, he placed the letter on the mantelpiece, to give it her in the morning.

At eleven o'clock he went to bed himself, smoked some time in his bedroom, put out his light at half past eleven, and then, as was his invariable custom, pulled up the blind before getting into bed, that he might see which way the wind blew on opening his eyes in the morning, his bedroom window commanding a view of the flag-staff and vane. Just as he had lain down he was surprised to observe the white pole of the staff flash into existence like a streak of phosphorus drawn downward across the shade of night without. Only one explanation met this—a light had been suddenly thrown upon the pole from the direction of the house. As every body had retired to rest, the old man felt it necessary to get out of bed, open the window softly, and look to the right and left. Eustacia's bedroom was lighted up, and it was the shine from her window which had lighted the pole. Wondering what had aroused her, he remained undecided at the window, and was thinking of fetching the letter to slip it under her door, when he heard a slight brushing of garments on the partition dividing his room from the passage.

The captain concluded that Eustacia was rather unwell, and would have dismissed the matter as not remarkable, had he not also heard her distinctly weeping.

"She is thinking of that husband of hers," he said to himself. "Ah, the silly goose! she had no business to marry him. I wonder if that letter is really his?"

He arose, threw his boat-cloak round him, opened the door, and said, "Eustacia!" There was no answer. "Eustacia!" he repeated, louder, "there is a letter on the mantel-piece for you."

But no response was made to this statement save an imaginary one from the wind, which seemed to gnaw at the corners of the house, and the stroke of a few drops of rain upon the windows.

He went into the passage, and stood waiting nearly five minutes. Still she did not return. He went back for a light, and prepared to follow her, but first he looked into her bedroom. There, on the outside of the quilt, was the impression of her form, showing that the bed had not been opened; and, what was more significant, she had not taken her candlestick down stairs. He was now thoroughly alarmed, and hastily putting on his clothes, he descended to the front-door, which he himself had bolted and locked. It was now unfastened. There was no longer any doubt that Eustacia had left the house at this midnight hour; and whither could she have gone? To follow her was almost impossible. Had the dwelling stood in an ordinary road, two persons setting out, one in each direction, might have made sure of overtaking her; but it was a hopeless task to seek for any body on a heath in the dark, the practicable directions for flight across it from any point being as numerous as the meridians radiating from the pole. Perplexed what to do, he looked into the parlor, and was vexed to find that the letter still lay there untouched.

At half past eleven, finding that the house was silent, Eustacia lit her candle, put on some warm outer wrappings, took her bag in her hand, and descended the staircase. When she got into the outer air she found that it had begun to rain, and as she stood pausing at the door it increased, threatening to come on heavily. But having committed herself to this line of action, there was no retreating for bad weather, since Wildeve had been communicated with, and was probably even then waiting for her. The gloom of the night was funereal; all nature seemed clothed in crape. The spiky points of the fir-trees behind the house rose into the sky like the turrets and pinnacles of an abbey. Nothing below the horizon was visible save a light which was still burning in the cottage of Susan Nunsuch.

Eustacia opened her umbrella and went out from the inclosure by the steps over the bank, after which she was beyond all danger of being perceived. Skirting the pool, she followed the path toward Blackbarrow, occasionally stumbling over twisted furze roots, tufts of rushes, or oozing lumps of fleshy fungi, which at this season lay scattered about the heath like the rotting liver and lungs of some colossal animal. The moon and stars were closed up by cloud and rain, the density amounting to a lunar and sidereal extinction. It was a night which led the traveller's thoughts instinctively to dwell on nocturnal scenes of disaster in the chronicles of the world, and on all that is terrible and dark in history and legend—the last plague of Egypt, the destruction of Sennacherib's host, the agony in Gethsemane.

Eustacia at length reached Blackbarrow, and stood still there to think. Never was harmony more perfect than that between the chaos of her mind and the chaos of the world without. A sudden recollection had flashed on her this moment: she had not money enough for undertaking a long journey. Amid the fluctuating sentiments of the day her unpractical mind had not dwelt on the necessity of being well provided, and now that she thoroughly realized the conditions, she sighed bitterly, and ceased to stand

erect, gradually crouching down under the umbrella as if she were drawn into the barrow by a hand from beneath. Could it be that she was to remain a captive still? Money: she had never felt its value before. Even to efface herself from the country, means were required. To ask Wildeve for pecuniary aid was impossible for a woman with the shadow of pride left in her: his assistance in driving her to Budmouth had become almost distasteful to her during the last few hours, and was of the nature of humiliation. Had he not eagerly offered to do it, she could never have employed him.

Any one who had stood by now would have pitied her, not so much on account of her exposure to weather, and isolation from all of humanity except the mouldered remains inside the barrow, but for that other form of misery which was denoted by the slightly rocking movement that her feelings imparted to her person. Extreme unhappiness weighed visibly upon her. Between the drippings of the rain from her umbrella to her mantle, from her mantle to the heather, from the heather to the earth, very similar sounds could be heard coming from her lips; and the tearfulness of the outer scene was repeated upon her face. The wings of her soul were broken by the cruel obstructiveness of all about her; and even had she seen herself in a promising way of getting to Budmouth, entering a coaster, and sailing to some northern or western port, she would have been but little more buoyant, so fearfully malignant were other things. She uttered words aloud. When a woman in such a situation, neither old, deaf, crazed, nor whimsical, takes upon herself to sob and soliloquize aloud, there is something grievous the matter.

"I can't go! I can't go!" she moaned. "No money: I can't go! And if I could, what comfort to me? I must drag on next year as I have dragged on this year, and the year after that as before. How I have tried and tried to be a splendid woman, and how destiny has been against me! . . . . I do not deserve my lot!" she cried, in a frenzy of bitter revolt. "Oh, the cruelty of putting me into this bad, ignorant, stupid world! I was capable of much; but I have been injured and blighted and crushed by things beyond my control. Oh, what wicked meanness it is of Heaven to devise such tortures for me, who have done no harm to Heaven at all!"

The distant light which Eustacia cursorily observed in leaving the house came, as she had divined, from the cottage window of Susan Nunsuch. What Eustacia did not divine was the occupation of the woman within at that moment. Susan's sight of her passing figure earlier in the evening, not five minutes after the sick boy's exclamation, "Mother, I do feel so bad," persuaded the matron that an evil influence was certainly exercised by Eustacia's propinquity.

On this account Susan did not go to bed as soon as the evening's work was over, as she would have done at ordinary times. To counteract the malign spell which she imagined poor Eustacia to be working, the boy's mother busied herself with a ghastly invention of superstition, calculated to bring powerlessness, atrophy, and annihilation on any human being against whom it was directed. It was a practice well known on Egdon at that date, and one that is not quite extinct at the present day.

She passed with her candle into an inner room where, among other utensils, were two large brown pans, containing together perhaps a hundred-weight of liquid honey, the produce of the bees during the foregoing summer. On a shelf over the pans was a smooth and solid yellow mass of a hemispherical form, consisting of bees-wax from the same take of honey. Susan took down the lump, and cutting off several thin slices heaped them in an iron ladle, with which she returned to the living-room, and placed the vessel in the hot ashes of the fire-place. As soon as the wax had softened to the plasticity of dough she kneaded the pieces together. And now her face became more intent. She began moulding the wax; and it was evident from her manner of manipulation that she was endeavoring to give it some preconceived form. The form was human.

By warming and kneading, cutting and twisting, dismembering and rejoining the incipient image, she had in about a quarter of an hour produced a shape which tolerably well resembled a woman, and was about six inches high. She laid it on the table to get cold and hard. Meanwhile she had taken the candle and gone up stairs to where the little boy was lying.

"Did you notice, my dear, what Mrs. Eustacia wore this afternoon besides the dark dress?"

"A red ribbon round her neck."

"Any thing else?"

"No—except sandal shoes."

"A red ribbon and sandal shoes," she said to herself.

Mrs. Nunsuch went and searched till she found a fragment of the narrowest red ribbon, which she took down stairs and tied round the neck of the image. Then fetching ink and a quill from the rickety bureau by the window, she blackened the feet of the image to the extent presumably covered by shoes; and on the instep of each foot marked cross lines in the shape taken by the sandal strings of those days. Finally she tied a bit of black thread round the upper part of the head, in faint resemblance to a fillet worn for confining the hair.

Susan held the object at arms-length, and contemplated it with a satisfaction in which there was no smile. To any body acquainted with the inhabitants of Egdon Heath the image would have suggested Eustacia Yeobright.

From her work-basket in the window-seat the woman took a paper of pins, of the old long and yellow sort, whose heads were made to come off at their first usage. These she began to thrust into the image in all directions, with apparently excruciating energy. Probably as many as fifty were thus inserted, some into the head of the wax model, some into the shoulders, some into the trunk, some upward through the soles of the feet, till the figure was completely permeated with pins.

She turned to the fire. It had been of turf, and though the high heap of ashes which turf fires produce was somewhat dark and dead on the outside, upon raking it abroad with the shovel the inside of the mass showed a glow of red heat. She took a few pieces of fresh turf from the chimney-corner, and built them together over the glow, upon which the fire brightened. Seizing with the tongs the image that she had made of Eustacia, she held it in the heat, and watched it as it began to waste slowly away. And while she stood thus engaged, there came from between her lips a murmur of words.

It was a strange jargon — the Lord's prayer repeated backward — the incantation usual in proceedings for obtaining unhallowed assistance against an enemy. Mrs. Susan uttered the lugubrious discourse three times slowly, and when it had been completed the image had considerably diminished. As the wax dropped into the fire a long flame arose from the spot, and curling its tongue round the figure, ate still further into its substance. A pin occasionally dropped with the wax, and the embers heated it red as it lay.

CHAPTER VIII.

IN SPITE OF RAIN AND DARKNESS SEVERAL WALK ABROAD.

WHILE the effigy of Eustacia was melting to nothing, and the fair woman herself was standing on Blackbarrow, her soul in an abyss of desolation seldom plumbed by one so young, Yeobright sat lonely at Blooms End. He had fulfilled his word to Thomasin by sending off Fairway with the letter to his wife, and now waited with increased impatience for some sound or signal of her return. Were Eustacia still at Mistover the very least to be expected was that she would send him back a reply to-night by the same hand; though, to leave all to her inclination, he had cautioned Fairway not to ask for an answer. If one were told or handed to him, he was to bring it immediately; if not, he was to go straight home without troubling to come round to Blooms End again that night.

But secretly Clym had a more pleasing hope. Eustacia might possibly decline to use her pen—it was rather her way to work silently—and surprise him by appearing at his door.

To Clym's regret it began to rain and blow hard as the evening advanced. The wind rasped and scraped at the corners of the house, and filliped the eavesdroppings like peas against the panes. He walked restlessly about the untenanted rooms, stopping strange noises in windows and doors by jamming splinters of wood into the casements and crevices, and pressing together the lead-work of the quarries where it had become loosened from the glass. It was one of the nights when cracks in the walls of old churches widen, when ancient stains on the ceilings of decayed manor-houses are renewed and enlarged from the size of a man's hand to an area of many feet. The little gate in the palings before his dwelling continually opened and clicked together again, but when he looked out eagerly, nobody was there; it was as if the invisible shapes of the dead were passing in on their way to visit him.

Between ten and eleven o'clock, finding that neither Fairway nor any body else came to him, he retired to rest, and despite his anxieties soon fell asleep. His sleep, however, was not very sound, by reason of the expectancy he had given way to, and he was easily awakened by a knocking which began at the door about an hour after. Clym arose and looked out of the window. Rain was still falling heavily, the whole expanse of heath before him emitting a subdued hiss under the down-pour. It was too dark to see any thing at all.

"Who's there?" he cried.

Light footsteps shifted their position in the porch, and he could just distinguish in a plaintive female voice the words, "Oh, Clym, come down and let me in!"

He flushed hot with agitation. "Surely it is Eustacia!" he murmured. If so, she had indeed come to him unawares.

He hastily got a light, dressed himself, and went down. On his flinging open the door, the rays of the candle fell upon a woman closely wrapped up, who at once came forward.

"Thomasin!" he exclaimed, in an indescribable tone of disappointment. "It is Thomasin, and on such a night as this! Oh, where is Eustacia?"

Thomasin it was, wet, frightened, and panting.

"Eustacia? I don't know, Clym; but I

can think," she said, with much perturbation. "Let me come in and rest; I will explain this. There is a great trouble brewing—my husband and Eustacia."

"What, what?"

"I think my husband is going to leave me, or do something dreadful—I don't know what. Clym, will you go and see? I have nobody to help me but you. Eustacia has not come home?"

"No."

She went on breathlessly: "Then they are going to run off together! He came indoors to-night about eight o'clock, and said, in an off-hand way, 'Tamsie, I have just found that I must go a journey.' 'When?' I said. 'To-night,' he said. 'Where?' I asked him. 'I can not tell you at present,' he said; 'I shall be back again to-morrow.' He then went and busied himself in looking up his things, and took no notice o' me at all. I expected to see him start, but he did not, and then it came to be ten o'clock, when he said, 'You had better go to bed.' I didn't know what to do, and I went to bed. I believe he thought I fell asleep, for half an hour after that he came up and unlocked the oak chest we keep money in when we have much in the house, and took out a roll o' something which I believe was bank-notes, though I was not aware that he had 'em there. These he must have got from the bank when he went the other day. What does he want bank-notes for, if he is only going off for a day? When he had gone down I thought of Eustacia, and how he had met her the night before—I know he did meet her, Clym, for I followed him part of the way, but I did not like to tell you when you called, and so make you think ill of him, as I did not know it was so serious. Then I could not stay in bed: I got up and dressed myself, and when I heard him out in the stable I thought I would come and tell you. So I came down stairs without any noise, and slipped out."

"Then he was not absolutely gone when you left?"

"No. Will you, dear Cousin Clym, go and try to persuade him not to go? He takes no notice of what I say, and puts me off with the story of his going on a journey, and will be home to-morrow, and all that; but I don't believe it. I think you could influence him."

"I'll go," said Clym. "Oh, Eustacia!"

Thomasin carried in her arms a large bundle, and having by this time seated herself, she began to unroll it, when a baby appeared as the kernel to the husks—dry, warm, and unconscious of travel or rough weather. Thomasin briefly kissed the baby, and then found time to commence crying, as she said, "I brought baby, for I was afraid what might happen to her. I suppose it will be her death."

Clym hastily put together the logs on the hearth, raked abroad the embers, which were scarcely yet extinct, and blew up a flame with the bellows.

"Dry yourself," he said. "I'll go and get some more wood."

"No, no—don't stay for that. I'll make up the fire. Will you go at once—please will you?"

Yeobright ran up stairs to finish dressing himself. While he was gone another rapping came at the door. This time there was no delusion that it might be Eustacia's: the footsteps just preceding it had been heavy and slow. Yeobright, thinking it might possibly be Fairway with a note in answer, descended again and opened the door.

"Captain Drew?" he said, to a dripping figure.

"Is my granddaughter here?" said the captain.

"No."

"Then where is she?"

"I don't know."

"But you ought to know—you are her husband."

"Only in name, apparently," said Clym, with rising excitement. "I believe she means to elope to-night with Wildeve. I am just going to look to it."

"Well, she has left my house; she left about half an hour ago. Who's sitting there?"

"My cousin Thomasin."

The captain bowed in a preoccupied way to her. "I only hope it is no worse than an elopement," he said.

"Worse? what's worse than the worst a wife can do?"

"Well, I have been told a strange tale. Before starting in search of her I called up Charley, my stable lad. I missed my pistols the other day."

"Pistols?"

"He said at the time that he took them down to clean. He has now owned that he took them because he saw Eustacia looking curiously at them; and she afterward owned to him that she was thinking of taking her life, but bound him to secrecy, and promised never to think of such a thing again. I hardly suppose she will ever have bravado enough to use one of them; but it shows what has been lurking in her mind; and people who think of that sort of thing once, think of it again."

"Where are the pistols?"

"Safely locked up. Oh no, she won't touch them again. But there are more ways of letting out life than through a bullet-hole. What did you quarrel about so bitterly with her to drive her to all this? You must have treated her badly indeed. Well, I was always against the marriage, and I was right."

"Are you going with me?" said Yeobright, paying no attention to the captain's latter remark. "If so, I can tell you what we quarrelled about as we walk along."

"Where to?"

"To Wildeve's—that was her destination, depend upon it."

Thomasin here broke in, still weeping: "He said he was only going on a sudden short journey; but if so, why did he want so much money? Oh, Clym, what do you think will happen? I am afraid that you, my poor baby, will soon have no father left to you."

"I am off now," said Yeobright, stepping into the porch.

"I would fain go with ye," said the old man, doubtfully; "but I begin to be afraid that my legs will hardly carry me there such a night as this. I am not so young as I was. If they are interrupted in their flight, she will be sure to come back to me, and I ought to be at the house to receive her. But be it as 'twill, I can't walk to the Quiet Woman, and that's an end on't. I'll go straight home."

"It will perhaps be best," said Clym. "Thomasin, dry yourself, and be as comfortable as you can."

With this he closed the door upon her, and left the house in company with the old man, who parted from him outside the gate, taking the middle path, which led to Mistover. Clym ascended by the right-hand track toward the inn.

Thomasin, being left alone, took off some of her wet garments, carried the baby up stairs to Clym's bed, and then came down to the sitting-room again, where she made a larger fire, and began drying herself. The fire soon flared up the chimney, giving the room an appearance of comfort that was doubled by contrast with the drumming of the storm without, which snapped at the window-panes and breathed into the chimney strange low utterances that seemed to be the prologue to some tragedy.

But the least part of Thomasin was in the house, for her soul being at ease about the little girl up stairs, she was mentally following Clym on his journey. Having indulged in this imaginary peregrination for some considerable interval, she became impressed with a sense of the intolerable slowness of time. But she sat on. The moment then came when she could scarcely sit longer; and it was like a satire on her patience to remember that Clym could hardly have reached the inn as yet. At last she went to the baby's bedside. The child was sleeping soundly; but her imagination of possibly disastrous events at her home, the predominance within her of the unseen over the seen, agitated her beyond endurance. She could not refrain from going down and opening the door. The rain still continued, the candle-light falling upon the nearest drops and making glistening darts of them as they descended across the throng of invisible ones behind. To plunge into that medium was to plunge into water slightly diluted with air. But the difficulty of returning to her house at this moment made her all the more desirous of doing so: any thing was better than suspense. "I have come here well enough," she said, "and why shouldn't I go back again? It is a mistake for me to be away."

She hastily fetched the infant, wrapped it up, cloaked herself as before, and shovelling the ashes over the fire to prevent accidents, went into the open air. Pausing first to put the door key in its old place behind the shutter, she resolutely turned her face to the confronting pile of firmamental darkness beyond the palings, and stepped into its midst. But Thomasin's imagination being so actively engaged elsewhere, the night and the weather had for her no terror beyond that of their actual discomfort and difficulty.

She was soon out of Blooms End valley and traversing the undulations on the other side of the hill. The noise of the wind over the heath was shrill, as if it whistled for joy at finding a night so congenial as this. Sometimes the path led her to hollows between thickets of tall and dripping bracken, dead, though not yet prostrate, which inclosed her like a pool. When they were more than usually tall, she lifted the baby to the top of her head, that it might be out of the reach of their drenching fronds. On higher ground, where the wind was brisk and sustained, the rain flew in a level flight without appreciable descent, so that it was beyond all power to imagine the remoteness of the point at which it left the bosoms of the clouds. Here self-defense was impossible, and individual drops stuck into her like the arrows into Saint Sebastian. She was enabled to avoid pools by the nebulous paleness which signified their presence, though beside any thing less dark than the heath they themselves would have appeared as blackness.

Yet in spite of all this Thomasin was not sorry that she had started. To her there were not, as to Eustacia, demons in the air, and malice in every bush and bough. The drops which lashed her face were not scorpions, but prosy rain; Egdon in the mass was no monster whatever, but impersonal open ground. Her fears of the place were rational, her dislikes of its worst moods reasonable. At this time it was in her view a windy wet place, in which a person might experience much discomfort, lose the path without care, and possibly catch cold.

If the path is well known, the difficulty at such times of keeping therein is not altogether great, from its familiar feel to the

feet; but once lost it is irrecoverable. Owing to her baby, who somewhat impeded Thomasin's view forward and distracted her mind, she did at last lose the track. This mishap occurred when she was descending an open plateau about half way home. Instead of attempting, by wandering hither and thither, the hopeless task of finding such a mere thread, she went straight on, trusting for guidance to her general knowledge of the district, which was scarcely surpassed by Clym's or by that of the heath-croppers themselves.

At length Thomasin reached a hollow, and began to discern through the rain a faint blotted radiance, which presently assumed the oblong form of an open door. She instantly knew that no house stood hereabouts, and was soon aware of the nature of the door by its height above the ground.

"Why, it is Diggory Venn's van, surely?" she said.

A certain secluded spot near Blackbarrow was, she knew, often Venn's chosen centre when staying in this neighborhood; and she guessed at once that she had stumbled upon this mysterious retreat. The question arose in her mind whether or not she should ask him to guide her into the path. In her anxiety to reach home she decided that she would appeal to him, notwithstanding the strangeness of appearing before his eyes at this place and season. But when, in pursuance of this resolve, Thomasin reached the van and looked in, she found it to be untenanted, though there was no doubt that it was the reddleman's. The fire was burning in the stove, the lantern hung from the nail. Round the doorway the floor was merely sprinkled with rain, and not saturated, which told her that the door had not long been opened.

While she stood uncertainly looking in, Thomasin heard a footstep advancing from the darkness behind her; and turning beheld a well-known form in corduroy, lurid from head to foot, the lantern-beams falling upon him through an intervening gauze of rain-drops which descended in front.

"I thought you went down the slope," he said, without noticing her face. "How do you come back here again?"

"Diggory?" said Thomasin, faintly.

"Who are you?" said Venn, still unperceiving. "And why were you crying so just now?"

"Oh, Diggory! don't you know me?" said she. "But of course you don't, wrapped up like this. What do you mean? I have not been crying, and I have not been here before."

Venn then came nearer, till he could see the illuminated side of her form.

"Mrs. Wildeve!" he exclaimed, starting. "What a time for us to meet! And the baby too? What dreadful thing can have brought you out on such a night as this?"

She could not immediately answer; and without asking her permission he hopped into his van, took her by the arm, and drew her up after him.

"What is it?" he continued, when they stood within.

"I have lost my way coming from Blooms End, and I am in a great hurry to get home. Please show me as quickly as you can. It is so silly of me not to know Egdon better, and I can not think how I came to lose the path. Show me quickly, Diggory, please."

"Yes, of course. I will go with ye. But you came to me before this, Mrs. Wildeve?"

"I only came this minute."

"That's strange. I was lying down here asleep about five minutes ago, with the door shut to keep out the weather, when the brushing of a woman's clothes over the heath bushes just outside woke me up (for I don't sleep heavy), and at the same time I heard a sobbing or crying from the same woman. I opened my door and held out my lantern, and just as far as the light would reach I saw the woman: she turned her head when the light sheened on her, and then hurried on down hill. I hung up the lantern, and was curious enough to pull on my things and dog her a few steps, but I could see nothing of her any more. That was where I had been when you came up; and when I saw you I thought you were the same one."

"Perhaps it was one of the he'th folk going home?"

"No, it couldn't. 'Tis too late. The noise of her gown over the he'th was of a whistling sort that nothing but silk will make."

"It wasn't I, then. My dress is not silk, you see. . . . Are we any where in a line between Mistover and the inn?"

"Well, yes; not far out."

"Ah, I wonder! Diggory, I must go at once."

She jumped down from the van before he was aware, when Venn unhooked the lantern and leaped down after her. "I'll take the baby, ma'am," he said. "You must be tired out by the weight."

Thomasin hesitated a moment, and then delivered the baby into Venn's hands. "Don't squeeze her, Diggory," she said, "or hurt her little arm; and keep the cloak close over her like this, so that the rain may not drop in her face."

"I will," said Venn, earnestly. "As if I could hurt any thing belonging to you!"

"I only meant accidentally," said Thomasin.

"The baby is dry enough, but you are pretty wet," said the reddleman, when, in closing the door of his cart to padlock it, he noticed on the floor a ring of water drops where her cloak had hung from her.

Thomasin followed him as he wended right and left to avoid the larger bushes,

stopping occasionally and covering the lantern while he looked over his shoulder to gain some idea of the position of Blackbarrow above them, which it was necessary to keep directly behind their backs to preserve a proper course.

"You are sure the rain does not fall upon baby?"

"Quite sure. May I ask how old he is, ma'am?"

"He!" said Thomasin, reproachfully. "Any body can see better than that in a moment. She is nearly two months old. How far is it now to the inn?"

"A little over a quarter of a mile."

"Will you walk a little faster?"

"I was afraid you could not keep up."

"I am very anxious to get there. Ah, there is a light from the window!"

"'Tis not from the window. That's a gig lamp, to the best of my belief."

"Oh!" said Thomasin, in despair. "I wish I had been there sooner. Give me the baby, Diggory—you can go back now."

"I must go all the way," said Venn. "There is a quag between us and that light, and you will walk into it up to your neck unless I take you round."

"But the light is at the inn, and there is no quag in front of that."

"No, the light is below the inn some hundred yards."

"Never mind," said Thomasin, hurriedly. "Go toward the light, and not toward the inn."

"Yes," answered Venn, swerving round in obedience; and, after a pause—"I wish you would tell me what this great trouble is. I think you have proved that I can be trusted."

"There are some things that can not be—can not be told to—". And then her heart rose into her throat, and she could say no more.

THE MARINERS' "CAUTIONARY SIGNAL."

GENERAL readers have very little knowledge as to the system of cautionary signals displayed at various parts of the Atlantic and lake coasts to warn shippers and skippers of approaching storms.

The "cherub who sits up aloft" is General A. J. Myer, with assistants Captain H. W. Howgate, Lieutenant Robert Craig, Lieutenant H. H. C. Dunwoody, and Lieutenant C. E. Kilbourne. It is just as well to know who are "taking care of the life of poor Jack."

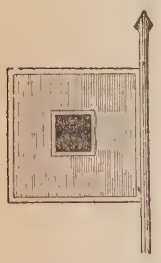
It is not designed to give in this paper a full account of the system or instruments of the office, nor to enter into the scientific, agricultural, or marine aspects of the work, further than to explain in a few words the distribution of the signal stations and the mode of signaling. A total of 145 stations was maintained in 1876, including those from which reports are deemed necessary and those at which other action is required, to enable warnings to be given of the approach and force of storms and of meteoric changes, for the benefit of commercial and agricultural interests. The average yearly cost of a station, exclusive of the pay and maintenance of the enlisted men on duty at each, is $424 03. The average force at each station is 1.4 men.

The duties of the men at each station forwarding telegraphic reports are to put in cipher and transmit tri-daily the results of observations, embracing the readings of the barometer, thermometer, the wind velocity and direction, the rain gauge, the relative humidity, the character, quantity, and movement of upper and lower clouds, and the condition of the weather. The same moment of absolute time is adopted at all the stations for these observations, so that they occur at various local times at the stations. Each observation is recorded at its own station. Three other observations are taken at the local times 7 A.M., 2 P.M., and 9 P.M., and recorded at the station. A seventh and special observation is taken at noon each day.

At the cautionary signal stations an observer is constantly on duty to show a signal which may be ordered at any moment.

At stations from which river reports are furnished, an observation of the depth and temperature of the water is made and reported at 3 P.M., local time, each day.

In case of threatening storms or dangerous freshets, any station may be called upon to make hourly reports.



The data thus gathered at a station are consolidated first in weekly and then in monthly reports, and transmitted to the central office in Washington, where they are collated, elaborated, and made of practical value. At this office are also concentrated reports from 626 places at which voluntary observations are taken on this continent, and from 272 places where simultaneous reports are had in foreign countries. From this great mass of data are continually elaborated the results which appear in the different issues and publications of the office, the daily forecasts telegraphed to the press throughout the country, orders for display of cautionary signals on the coast line, the charts, and the weekly and monthly publications.

The work of the office is steadily increasing in accuracy, and the percentage of verifications of forecasts had risen from 76.8 in 1872 to 88.3 in 1876. It is believed that an average of 90 per cent. of accuracy is attainable. During the year 1876, 1577 cautionary signals were ordered, counting each separate display at each port a separate signal, in anticipation of seventy dangerous

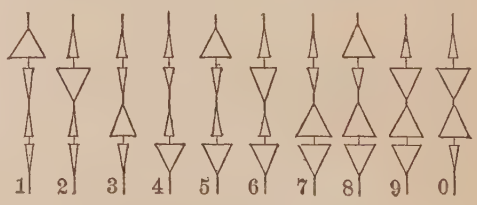
storms. Of the total number of signals thus displayed, 77.3 per cent. were afterward reported as justified by the occurrence of winds having a velocity of twenty-five miles per hour. In the cases reported as failures of justification the winds did not attain the prescribed degree of violence. It is difficult to determine beforehand the exact rate which the wind may have at a given point in advance of its then position, and the office has to carefully steer its way between the considerations of loss occasioned by delay of shipping, owing to warnings unnecessarily given, and the far more serious matter of damage inflicted by winds unannounced.

The cautionary signals for shipping are upon the coast, sea-board, or lake, and in view of the mariner. Each is under the charge of a sergeant and assistant, whose duty may be described as pickets of warning on the fringe of the country. The observations from the observing stations having converged upon Washington, and the general and special predications arrived at, the announcements radiate from the central office—the brain—along the wires, or nerves, to the remotest digits upon the signal halyards.

When, as is sometimes the case, the signal station is placed in the Life-saving Service station, a farther advantage is gained, as the two work well together, and the Life-saving Service has the benefit of the wires of the sister enterprise.

CAUTIONARY SIGNAL FLAG.

The cautionary signal of the United States Signal Service is a square red flag with a black square in the centre by day; a red light is used by night. The flags are of two sizes—15×15 feet and 8×8 feet, the black square being one-ninth of the area of the flag. The larger flag is used for important stations, about ten in number, and the smaller flag for the other stations.



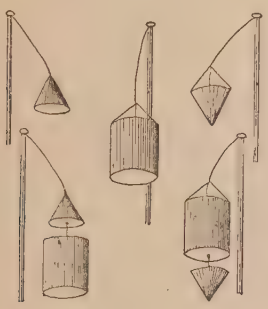
The stations on the Atlantic are from Maine to Texas, and on the lakes from Oswego to Duluth. The number of stations on the Atlantic proper is twenty-four, counting Key West; and on the Gulf of Mexico, six, omitting Key West, already enumerated. The lakes have fifteen stations. Warning notices are also sent by telegraph to the Canadian meteorological service when any disturbance occurs which is likely to affect them, and is distributed to the points interested.

The purport of the signal is this: "A wind having a velocity of twenty-five miles an hour may shortly be expected at this place."

That is all that the flag professes to say; the probable excess over twenty-five miles an hour, and the direction of the wind, are not given by the flag. The time may shortly arrive when, by an extension of the system, the additional data, such as "severe storm expected," may be embodied in the signal; but at present the notice is just what it is called and professes to be—"cautionary." It is then the duty of the mariner, shipper, or whoever else is interested, to consult the weather report for farther information, and to make frequent examinations of local barometers and other instruments, and study the local signs of the weather.

When the time shall arrive that the Signal Service shall have sufficient confidence in its data to make more detailed display of warning, affording more explicit notice of the expected disturbance, the signals will have a more elaborate reading. The authorities will then determine upon a method and code, and perhaps may find it desirable to use objects which are not subject to change of apparent shape according to the position from which they are viewed. One or two modes have been adopted in Europe, and may be noticed.

Redl's system of cones for telegraphy was particularly designed to construct the individual portions which were associated to form a signal so that they could be read wherever they could be seen; not liable, like a flag, to be blown toward or away from the observer, so as to be illegible to him, nor liable in a calm to hang down the mast, and be therefore useless. Redl's system consists of four cones attached to a mast, and normally in a collapsed state. Either may be spread, umbrella fashion, by pulling on a cord, and the group shows the mode of indication of the numerals from 1 to 0. A cone of three feet base is ordinarily visible in daylight at five miles' distance, and the code may be used by means of black and white flags in the absence of cones.



REDL'S CONE SYSTEM.

The number indicated by a series of successive displays is referred to in a code book of some 60,000 possible messages.

Admiral Fitzroy's (English) storm signal consists of a hollow cylinder and cone, either of which, or both simultaneously, may be suspended from a mast or staff so as to be visible to ships in port or in a roadstead. Their positions and grouping denote the

probable direction of the wind in an approaching storm. Thus: cone point upward to the right of the staff—northerly gale; cone point downward to the left of the staff—southerly gale; cylinder above—expect dangerous winds from both quarters successively; upright cone above cylinder—dangerous wind expected from the north; reversed cone below cylinder—dangerous wind expected from the south; and so on.

It took some time to inspire the British sailor with confidence in the storm signals of Admiral Fitzroy, but in 1864 it was found

ADMIRAL FITZROY'S SIGNALS.

in England that 50 per cent. of the storm warnings had proved correct, and in 1865 that 73 per cent. had been verified. In France, during the year 1865, seventy-one warnings were realized, and seventy-six in the following year; 89 per cent. of the storms which occurred were signaled in the first winter, and 94 per cent. during the second. The North German *Seewarte* mentions that out of the storm warnings hoisted at Hamburg in a given period 94 per cent. were correct. The forecasts of the weather are derived in Europe more largely than in the United States from local observations, and less relatively from observed movements at distant points. The extent of territory of the United States is peculiarly favorable in allowing the movements of a storm to be traced from point to point, and to be anticipated in regions to which it is trending. The United States mariner has not alone the benefit of observations and deductions from local instruments, but also of predictions from the head-quarters of the government service, derived from the tri-daily reports of all the atmospheric conditions at widely separated points of observation, taken at the same instant of absolute time—observatory time at Washington. As a storm from the Gulf or the Northwest drifts into the area of observation, its course, force, and extent are obtained from collation of the data from various points, and the time of its arrival at any point within its sweep is fore-announced with substantial accuracy.

HELEN.

MISS LAURESTON was standing at her study window in brown-study. She was an elderly lady of some forty years, with handsome, severe features, and a figure so straight that it seemed never to have unbent since the days of babyhood. The room, with its sombre tints, was handsome and dignified like its owner, its floor soft with dark Smyrna carpets, and its walls imposing with row upon row of soberly bound volumes. The distant fire-light executed a sort of witches' dance over the dark foreground and the motionless figure at the window. It was Christmas night through the world, and a robin's snow was falling softly outside.

Miss Laureston watched the snow-flakes dropping silently into the circle of faint light, until the gathering darkness changed the glass to a mirror which showed her nothing but a tall ghostly form answering to her own. She looked at this form curiously at first, and then uneasily. Even as it stood between her and the outer world, and set before her eyes the room that lay behind her, so it seemed to stand between her and the onward-coming life, and to set before her thoughts the life that lay behind her.

It was a large, lonely house she lived in, with no friends, no guests, no Christmas cheer. She remembered another house, many miles away, that used to be lighted from top to bottom when Christmas came round. And on dark winter nights the glass used to throw back another figure beside her own—a delicate girlish figure that was sometimes laughing, sometimes crying, sometimes merry, sometimes reproachful, but in all its myriad moods never other than loving and innocent—the figure of her young sister. And in all the world no stranger was less likely to know of its present abiding-place than she herself this Christmas night.

Camilla—Milly—Milly Laureston. The name was in her thoughts oftener to-night than it had been on her lips for twelve long years. One picture came back very brightly: the old homestead, with its quaint sloping roof, from whose highest window one could see the spire of the village church, and hear the noon bell when the day was still. It was on one of those still days that she had taken the little one from the arms that folded it so quietly, and carried it to her own room, knowing that she at ten and Milly at two were both alone in the world.

Alone, except for an old uncle, who, hearing of his sister-in-law's death, came back to settle himself at the homestead, and to give to the two children a care more affectionate than wise during the few remaining years of his life.

From the first, Agnes was his favorite. He was an infirm man, withdrawn from all the active affairs of life, and with something of the old alchemist's spirit in his blood; most happy when left undisturbed to his library and his laboratory. Miss Laureston remembered as if it were but yesterday that weird room fitted up under the sloping eaves, with the pale blue light from the spirit-lamps shining over retorts and mysterious bottles. The curious noises and explosions never terrified her as they did her sister. While Milly would throw her apron over her head, and hide in the farthest corner of the house, she would creep up the attic stairs, and, with her face pressed close to the laboratory door, would listen in breathless expectation for the next developments from within. One day her uncle found her there, and after that the mysterious room was made free to her, though prohibited to the rest of the household. She never disarranged his implements or meddled with his dangerous reagents. No mouse could be quieter than she was, or more unlike a child. With her noiseless ways, her love of books, her dislike of every thing that was not decorous and quiet, her hatred of weakness and demonstration, she grew into the old man's life just in proportion as she grew farther away from her sister's.

Milly was a little hoiden, laughing, pouting, crying, caressing, all in one breath. As a child, she could not be trusted in the neighborhood of any thing that was breakable; and her pranks were as countless as they were troublesome to her grave elder sister and uncle. As a maiden, she was full of caprice, hated gloominess, and filled the house with young companions after her own sunshiny heart. Agnes was patient with her, but it was the patience of a superior being for an inferior. Mr. Laureston was kind to both his nieces, but he treated Milly as a troublesome child, Agnes as a valued confidante. The years that lessened the practical difference in the ages of the two girls only increased this unconscious difference of treatment. He died when Milly was fifteen, and never guessed what a silent, uncomplaining, though childish, longing for love was springing up in the heart of his younger niece with her growing womanhood.

Agnes was at that time twenty-three, and considering the difference in the ages of the two sisters, as well as his own limited knowledge of the character of one of them, he was perhaps justified in leaving his property as he did. Almost every thing was given over into the hands of Agnes. She was made the guardian of her young sister. A small sum was to belong unconditionally to Milly when she came of age. The remainder of the large estate was settled upon Agnes, leaving it to her judgment and generosity what part of it her sister was to inherit.

Miss Laureston thought of all this, walking restlessly up and down the room, and struggling with the dumb pain that filled her heart. She knew that she had fulfilled that trust conscientiously. She had at once resolved to give Milly half the property on her majority, and had devoted her life to the fitting of her sister for the responsible station she was to occupy.

Never was a kitten more unwilling to be trained than was Milly Laureston. She would not study; she could not be made to walk sedately or to behave herself properly at home or abroad. When she was scolded, she would cry like a baby; when she was petted, she would flush and brighten, and some new piece of mischief would dance into her eyes. Every thing frightened her, from a mouse to a ghost, and grave talk only made her hide her face and run away.

Agnes was strong, calm, and self-repressed. A caress from her was a sign of the deepest emotion, and when Milly begged for them constantly, and told her with tears that she did not love her because of the want of them, she only smiled and tried to have patience with her sister's weakness. In all this she was ignorant of the pain she was giving, or of the childish heart that was longing so passionately to be loved in its own way.

She was ignorant of it this Christmas night, and did not know why the look that used often to be on Milly's face, like that of a child in pain, should haunt her so bitterly. The lonely room, the lonely house, the lonely life, out of which that face with its shining hair had gone twelve years ago—these were all that remained to her to-night.

Milly had left her, had run away from home, leaving no clew by which to trace her. They afterward ascertained that she was married to a strolling actor, Paul Gessner, whom Miss Laureston would have disdained to receive among her servants—a disreputable foreigner who had found his way to Milly's heart by a handsome face and a soft, caressing manner.

Agnes took up her life again as best she could, sternly resolving that it should not be broken by the fault of another. She sold the old homestead, and looked around for another home. A cousin who had been an old school friend, and who was married now, wrote from a distant town begging her to make her home with them. This she would not do; but feeling even in her self-isolation some need of human friendship, she bought the house she now occupied, and which was only a short distance from her cousin's, and moved there in less than a month after her sister's marriage. Here she had lived for twelve years, and here she was growing old.

Her cousin had two children—a boy of five, and a little girl younger still; but the baby face of the little one bore some shad-

owy resemblance to her sister's, and she shrunk from seeing it. Harry was more of a favorite, and soon contrived to make himself very much at home in Aunt Agnes's sombre house.

As Miss Laureston brought her thoughts down to this point, she remembered that to-morrow was Christmas, and that this young gentleman probably had unlimited expectations from her liberality on that occasion. Breaking away from her thoughts, she sent for the old nurse, who had come with her to her new home, and had never been absent from her a week at a time since her babyhood.

"Nurse, has any thing been done for Harry? I forgot all about him, and he will be disappointed if he does not get something to-morrow."

"He won't be disappointed, Miss Agnes," said the old woman, a comical look flitting over her rugged face—"leastwise, not unless he's very unreasonable. If you'll just have lights, so as to make it a bit more cheerful for you, I'll show you some little things out here in the hall closet."

Miss Laureston rang for the lights, and then stepped out into the hall and peered curiously into the dim closet in search of the "little things."

She held up her hands in dismay. It was a perfect store-room of child's playthings, all jumbled together in utter confusion. Sleds, kites, hoops, balls, toy villages, diminutive fire-engines, picture-books, trumpets suggestive of dire sounds, and bright jackknives suggestive of still direr results—playthings with and without name, enough to supply a regiment of children, met her astonished eyes.

"Nurse, nurse," she exclaimed, "what are we going to do with all these things? Why, there will be nothing left to give him all the rest of his days! Kites and hoops in the winter! And there—yes, that is certainly a doll and a doll's house!"

"For Master Harry's little sister these things are," interposed the old woman.

Miss Laureston stopped short in sudden confusion; she had forgotten the existence of the little girl.

"To be sure," she said, hurriedly; "you were quite right, nurse. I have been too much occupied to think about it. But Harry can not have all these things. Here are enough to fill a toy-shop."

"No, Miss Agnes; but I thought, perhaps, after you'd taken all you wanted for the children, you'd like to send the others to those Caxtons that live down near the village. They are as poor as poor can be, and the house is just packed with children. I don't expect they even know what Christmas means."

For the second time Miss Laureston blushed with self-reproach.

"What a selfish, unfeeling person I am!" she mentally ejaculated. "My very servants have more thought for the poor than I."

She turned slowly back to the library, saying, "Yes, nurse; send them any thing you please. And put in a chicken or two with the other things."

The fire-light and lamp-light together made the room look very cheerful as she closed the door behind her and shut out the world. But Miss Laureston's thoughts were any thing but cheerful.

"A lonely old woman," she was saying to herself, "forgetting every body, and forgotten by every body. That is what I shall be soon. Not a soul the better or happier because I am in the world. I wonder," she thought, confusedly, "whether I have not made a mistake somewhere? There must be a way to people's hearts, but I don't know how to take it; I don't remember that I ever cared to know."

"Did she care now?" she asked herself, with a vague uneasiness growing out of her thoughts about her sister. She was not quite sure, but she remembered that Milly used to care. Milly used to be fond of children too. Perhaps if she were to take a little child home— But at this point she roused herself, and tried to shake off her fancies. What love of children had she, or understanding of them, to fit her for such a responsibility? "The child would fear me," she thought, drearily, "just as Milly used to. I must even go my own way till I am old."

She walked up and down the room once or twice, and at last stopped before a large picture that rested on an easel. It was a beautiful engraving of the head of the Angel Gabriel, by Delaroche. The exquisite outline, the wonderful meekness and purity of the bent head, moved her as they had never done before. The saintliness that encompassed it touched her life with a feeling of comfort. She returned to it several times during the long lonely evening, and after she fell asleep, had a curious dream concerning it.

She thought she was walking along a very rough and stony road, carrying a little child in her arms. A thick darkness was around her, so that she continually stumbled and fell. As she went on some one came softly up behind, and she looked round and saw the Angel Gabriel by the faint light which shone around his head. He held in his hand a trumpet which he raised to his lips, but instead of sound blew from it light—a broad and brilliant radiance that illumined the whole landscape. Being in her sleep without fear of him, she asked, "Do you light my path because I have this child in my arms?"

"Yes," he answered. "As long as you carry that child, you shall have light wherever you go."

After that the dream grew indistinct, and gradually faded away in deeper sleep.

The next day was clear and pleasant, with a light snow only an inch or two deep covering the ground. About noon she remembered Harry, and began to wonder whether he would make her a Christmas call or not.

That was the precise point which Master Harry himself, perched on an old stone wall not many rods away, was anxious to settle; for he was strictly forbidden to go to Aunt Agnes's house that morning, Mrs. Gaston, knowing his propensity to demand presents, having proved obdurate to his most pathetic coaxings. As far as the turn in the road where the stone wall ended he might go, and no farther. Was ever such a Tantalus restriction devised before? for there in sight were the very chimneys down which he was sure Santa Claus had swooped the night before. He was not quite sure that it was not his solemn duty to go and divide the spoils, on the principle of a law of nature superseding an artificial one; but as his conscience was uncomfortably active, he compromised the matter by resolving to stay where he was—as long as the snow lasted.

The snow was rapidly disappearing, but delightful hoards of it still lurked in the cool crannies of the wall. While he was down on his knees busily unearthing a specially fine deposit, two hands suddenly appeared over the top of the wall, and a little girl miraculously dropped into the road at his side. She was muffled up in coarse wrappings, and came down on her feet like a gigantic snow-ball.

Harry stared at her a moment or two, and then he got up and stared at the wall. But it was a very thick and high one, far above his head, and he could see nothing at all; only he fancied he heard a faint rustling, as if a snake were slipping away among the dead leaves on the other side. When the sound died away he turned his attention to his new comrade. She was a tiny little creature, shivering with the cold, and half sobbing with fright and sleepiness. When Harry touched her she stopped crying, and looked at him out of a pair of big blue eyes.

"You is not as pretty as my little sister," said Harry, after a critical inspection of her eyes, nose, and mouth. "Who's your mamma?" he demanded, receiving no answer to this remark. "Is you Santa Claus's little girl, and did he drop you here for a Christmas present?"

Still no answer, but the same wondering look.

"It's perlite to answer when people speaks to you, mamma says."

Finding that this hint was not taken, he offered to initiate her into the mystery of making snow-balls, in the hope that this might unloosen her tongue. The child seemed to understand this language, for she laughed gleefully, and the two soon established a very satisfactory copartnership in mud and snow.

But by-and-by prudence suggested to Harry that he should beat a retreat in one direction or the other, for very soon mamma would be sending to look for him. He looked at his companion, and seeing what a little creature she was, a dim sense of masculine responsibility concerning her began to enter his mind.

"Are you a-coming to visit my mamma?" he asked, doubtfully. Then a bright thought popped into his head, a delightful reconciliation of duty and interest. "You's a-going to see Aunt Agnes," he proclaimed, decisively. "I'll go and show you the way, 'cause you's too little to go alone. Mamma will be very glad if I doesn't let you go alone."

The child stood still, looking at him with the same questioning blue eyes.

"Mamma will be *very* glad," repeated Harry, with dignity, holding out his hand.

She put her little fat one into it, and he led her toward the house with sparkling eyes.

"I will tell Aunt Agnes you's a present from Santa Claus, and then p'r'aps—*p'r'aps* she'll say he left a present for me too."

But though the house was in sight, they did not get over the road very fast; the tiny feet of Harry's little Christmas present were hardly used to walking on smooth floors; they stumbled very uncertainly through the clinging mud left by the melting of the snow. He had fairly to drag her up the broad front steps at last. This accomplished with some difficulty, he marched straight to the library to find Aunt Agnes, still pulling her along by the hand, and pushed open the door without ceremony.

Seldom had two dirtier children invaded a well-ordered room than the two who met Miss Laureston's astonished eyes as she looked up from her book. Harry dropped the child's hand and ran up to her.

"Aunt Agnes, you said you did want a little boy one time when I comed to see you. I couldn't find any little boy, 'cause they all have mammas; but I found a little girl, and she's a Christmas present for you, auntie, from Santa Claus."

Miss Laureston looked in bewilderment from her nephew as he calmly appropriated and presented his treasure-trove to the little stranger he had left standing near the door. Such a baby as she looked, and so forlorn, standing there all alone in that great room, with both tiny hands clinging to a chair, and her eyes half closing from sheer weariness. Something woke up in Miss Laureston's heart that had never been there before, and she hastily crossed the room and lifted the child in her arms, mud-

dy dress and all. As she did so, her eyes rested upon the picture of the Angel Gabriel, and a sudden thrill went through her at the remembrance of her dream. The child went quietly to sleep without even looking to see who held her, and Miss Laureston studied the baby face so close to her own with a curious mixture of uncertainty and satisfaction.

"Harry," she said, "come here and tell me who this little girl is."

But Harry, having caught a glimpse of nurse in the hall, had already stolen out of the room, with a prophetic inkling of the things to be revealed in that closet.

Miss Laureston waited patiently for an hour, still holding the sleeping child in her arms, till her nephew again made his appearance, with sundry hoops, steam-engines, and carts bouncing after him. Then she repeated her inquiry: "Who is this little girl?"

"I don' know," said Harry. "She comed over the wall all of a sudden; two hands dropped her down in the road. I guess it was Santa Claus."

When Miss Laureston came fully to understand the facts of Harry's marvellous story, there was a commotion in the great house. Servants were sent right and left to discover the owner of the child her nephew had abducted. The stone wall, the neighboring woods, all the country round, were searched, but all to no purpose. The little girl wore coarse clothes, not unlike those of the children of poor families, and tied around her neck was a handkerchief of somewhat finer quality, having on it the name Camilla E. Beckwith.

The old nurse was the first to discover the name, and showed it to her mistress, with some hesitation, remembering the other Camilla, who was Milly Gessner now, and never Milly Laureston again.

Miss Laureston just glanced at it, and turned away her head.

"Take it away, nurse," she said, wearily, "and ask Mr. Adams to call here as soon as he can make it convenient. I want to consult him about the best way of advertising for the child's friends. This name will be of some help."

Mr. Adams was her lawyer; he made his appearance that afternoon, and was soon put in possession of the whole story, as far as any body knew it. But when she came to the name a sudden look of intelligence flashed over his face.

"Camilla Beckwith, you said? There was no other mark found upon any of her clothing?"

"None that we could discover."

"And the clothes were coarse like those worn by poor people?"

"All except the handkerchief, which was of fine quality."

"Then I suppose that I can tell you her parentage, Miss Laureston; but I fear it will not be of much use in solving the question what is to be done with her." To his surprise something very like pleasure came into the eyes of his companion at this last remark. He waited a moment, but as she gave no explanation of it, he went on: "You doubtless are acquainted with the fact that suicides are unfortunately not uncommon among the poor at this time of the year, when the cold weather causes increased destitution?"

Miss Laureston started, and then asked, "Are the child's parents dead? Did either of them—"

Mr. Adams answered the question as if she had finished it. "Yes; the woman I believe to be the mother of the child was found drowned in the river last night. Her body was taken to the morgue, and on it were several articles of clothing marked with that same name—Camilla Beckwith. She was, moreover, identified with a woman who has been lurking round this neighborhood for several days, having with her a child like the one you describe. Doubtless with some notion of providing for its safety, she dropped it down beside your nephew in the curious manner he reported before going away to carry out her own desperate plan."

"Drowned! On Christmas night!" repeated Miss Laureston, in a low, oppressed voice. "The very night of all others that the world is full of happiness!"

"It was very sad. If she had made her poverty known, help would have been given her without doubt."

Miss Laureston was silent. Across her decorous, quiet, well-ordered life flashed the vision of this suffering woman, to whom no help was so welcome as the help that came from the dark river. She felt almost suffocated, as if from a bodily feeling of the pressure of human suffering. It was the first time any pain but her own had ever come so near to her. It was the first time she, whose whole ideal of life was proud strength, had ever felt pity for despairing weakness. In the midst of her confused thoughts a conviction crept through her that this new anguish of pity, this strong yearning over the motherless child, was the first ray of the visionary light that should lighten her path.

"My Helen—my Light!" she repeated, softly, to herself, with a sudden resolve to call the baby Helen, because of its beautiful meaning. She did not even say to herself that she would adopt her, so completely did she seem to belong to her and to no other in all the world.

"May I not see the little girl?" asked Mr. Adams, breaking in upon her reflections. "I should like to see if she resembles her mother."

Miss Laureston colored, hesitated, and at last ordered the child to be brought in. The reason of her hesitation became manifest a minute later. The gentleman, who was expecting to see a little waif wrapped in coarse clothes, or at best the cast-off garments of charity, almost rubbed his eyes with amazement when the nurse came, bringing in her arms a tiny dimpled maiden arrayed in the whitest of white dresses, delicate sash, and bronze shoes, and set her down by the side of the mistress. Most wonderful of all, there was Miss Laureston herself, the strictest and most unbending of dignified ladies, actually stooping over the child to caress its short silky curls as it clung to her knees, with a look as if she had forgotten every one else in the room but the baby whose face she had never seen till two short days ago.

Mr. Adams put on a resigned look, and tried to remember that he was dealing with a woman. Miss Laureston presently remembered that *she* was dealing with a man, and tried to give her mind to business. A sudden doubt chilled her whether, after all, she was free to keep her treasure.

"Is it not possible that the child may have other friends—besides the mother?" she asked, hesitatingly.

"It is possible, of course. But I think in that case the woman would have left it with them, since she evidently did not wish it to perish with herself. Besides, judging by what we know of the mother's history, it would hardly be a benefit to the little girl to give her over to such relatives, if they exist, nor is it likely that they would have any desire or ability to take care of her. She will be much better off in some orphan asylum."

Miss Laureston looked up indignantly, but was appeased by the twinkle in the lawyer's eyes that accompanied these last words.

"No orphan asylum will ever have her," she said, taking up the child, who commenced to tug at her bracelet. The deluded woman immediately took it off, and surrendered the costly plaything into the baby hands, to be mauled as it might suit them.

"She's welcome to every thing already, I see," remarked Mr. Adams, with another twinkle.

"She is welcome to every thing I have in the world," said Miss Laureston, with such evident sincerity that his politeness hardly kept him from a surprised whistle.

"Wonder what they'll think of this over at Gaston's," he thought: "those two children might have come in for the property if this one hadn't turned up." Then, aloud, and with all deference, he inquired, "What is the name of the little lady? I presume you have already had her christened."

"Not christened yet," said Miss Laureston, laughing, "but named. Her name is Helen."

This she said with as much assurance as if the name had been a fact of ten years' standing, instead of ten minutes', in her thoughts.

"Then, little Miss Helen, will you shake hands with a new friend, who is an old friend of your—"

"Of her aunt's," said Miss Laureston, composedly. "Shake hands with the gentleman, Helen."

As if she understood, the child stretched out a tiny hand; but when he offered to take her in his arms, she pulled away with a little cooing laugh, and hid her face on her new aunt's shoulder.

The color flushed all over Miss Laureston's face with delight, while she pretended to scold Helen for her shyness. Long years afterward, she used to say that Helen would never once leave her of her own free-will to go to any one else all the days of her babyhood, and that she believed it would almost have broken her heart if she had done so. The child was happy and contented with many other people as long as Aunt Agnes was not in the room, but when she was, nobody would answer but this same Aunt Agnes. If any body else offered to take her, she always had refuge in the same pretty trick of turning her back on the suppliant, and peering out at him from behind Miss Laureston's head.

Mr. Adams was mistaken in one of his surmises. Kind, generous Mrs. Gaston never troubled herself about the possible disposition of her cousin's money, but she did feel a little astonished, and not a little hurt, to think that her own baby girl had always been unnoticed, while Miss Laureston was so ready to take this stranger to her home and her heart.

But then there was Harry; he had found the mysterious way to Aunt Agnes's heart —a fact which nobody knew better than the young gentleman himself. Mrs. Gaston thought of Harry, and thought of the lonely life her cousin had led, and she was not able to keep any harsher resentment than a slight coldness of manner toward the tiny princess who had so suddenly come to her kingdom.

Meanwhile Miss Laureston gave herself over wholly to the strong affection that colored her sober, elderly life with something of the lost grace of youth. She certainly loved Harry, but she almost idolized Helen. The very faults of the child were beautiful in her sight, and no purple and fine linen was too costly to be lavished upon her.

Helen soon learned to talk plainly, to run about easily, and to get into mischief more easily. It took the whole corps of servants to watch her, and there were not many nooks in the dark stately house out of which her dimpled face, with its flushed cheeks and its soft rings of shining hair, did not peep sooner or later.

When night came Miss Laureston would carry her to the library, where the fire-light shone on the head of the Angel Gabriel, and rock her softly to sleep, while all the flickering light of the room seemed to gather and rest tenderly upon the baby form.

Once, when she had laid her in her crib and was sitting alone, still humming softly to herself the old cradle song she had been singing to Helen, a sudden vision came to her of the years that were gone and the life that could never be recalled—her sister's life and her own. The love that she showered upon the child up stairs—how much of it had she showed to her young sister? The kisses that were rained upon Helen's face—could she not remember the time when Milly had pleaded for only one, and reproached her that she never gave it voluntarily? Could she not remember how the tears had dropped one by one over Milly's face when she told her, very gently indeed, that she was fanciful and unreasonable in doubting her love because it could not take that childish form? Did she think it childish now, when Helen's little hand was laid against her lips? and did the God who sent loving, child-like hearts into the world mean that they should be left to wear themselves out with pain because they were not schooled in the self-contained dignity of calmer natures?

For the second time the lesson appointed to her, the light that was to light her path, came in pain, came at the hands of the child she had named Helen, the light of her life. From that day Miss Laureston learned to distrust herself. Remembering her own childhood, it made her uneasy to see Helen grave even for a moment, or turning from her play to books. It pleased her best when the child was busiest at mischief and every corner of the dim rooms echoed with her laughter, so that she was fairly in danger of being left to grow up in ignorance, if Miss Laureston's common-sense had not finally come to the rescue. She was eager that Harry should spend much of every day at her house, in order that Helen might have some one of her own age to play with. And when the two had succeeded in devising any specially unheard-of prank, the cheerfulness with which she went round inspecting damages was an indescribable exasperation to the unlucky servant who had to restore order.

The two children grew up inseparable in all their plays, having only one chronic bone of dispute between them—for Harry would not own that Helen was as pretty as his sister. The little lady felt herself greatly aggrieved at such uncomplimentary speeches, and always retorted by leaving him to himself, and running away to find Aunt Agnes. Harry soon found wisdom to be the better part of valor, and compromised his principles for his comfort in the most unheroic manner by admitting that his playmate might some time be almost as pretty as Kitty, Providence permitting.

But this was not till the young lady was twelve years old, and Master Harry considered himself to have arrived at years of discretion. They had many a pitched battle before that time, but generally agreed to a truce the first pleasant day afterward. In rainy weather they took the great garret for a field of operations, and Miss Laureston never suspected that Milly's picture, so many years forgotten, was dragged out by their childish fingers, and with some difficulty restored to a perpendicular position. They named it "the pretty lady," and Helen dusted it off with her white dress. Afterward they often pretended that it was alive, and the silent, sweet face of "the pretty lady" was made a sharer in many of their impromptu plays. As she grew up, Helen, in her more quiet moods, used often to slip away and sit for hours facing the portrait, weaving her own quaint fancies in this unknown presence.

When she was fifteen, and was beginning to put on the shy, delicate ways of young womanhood, Miss Laureston was nearing what the world calls old age. And when, as often now, she realized this, and saw the whiteness on her hair, and knew that the one dear love which made her able to meet old age gladly and peacefully was the love that came to her that Christmas night to be the light of her life, she had no words for the blessings that her heart poured out on Helen's head, no words for the penitence and humility that filled her when she thought of her sister. These twenty-five years had passed without sign from Milly, and she did not now believe her to be alive. But with a longing desire for atonement, she sometimes tried to find her way into the hearts and lives of the poor. The sense that she failed in this was the only failure that greatly troubled her. For those she tried to benefit gave her gratitude and gladness, and even a distant, respectful affection, but she never knew how to find the way to their natural, spontaneous love, and they never knew how to show it.

At fifty-five a nature can not be wholly changed, if indeed it ever can. Miss Laureston did not understand that there were uses for all kinds of natures, and she was painfully trying to change her own to a model it never could have fitted. Her youthful fault had lain, not in being reserved and undemonstrative, but in expecting every one else to be so too; and now she was making the opposite mistake of refusing her own character any place or usefulness in the world.

But whoever else misunderstood her, Helen never did so, or was other than fearless

in the presence of the love that had sheltered her from all the storms of life. It occurred to the girl one day to ask Miss Laureston about the picture in the garret, and why it was not hung down stairs. In all those fifteen years she had never put a question about it before, for it was so completely a part of her childhood that it seemed never to have had any other history or any name.

Miss Laureston had forgotten the existence of the picture, and was struck with a keen remorse. She at once ordered it to be brought down stairs and hung in a place of honor, at the same time giving Helen the outline of her sister's story.

It was a bright sunny day in late October that the picture was rehung, and the clear eyes of Milly Laureston looked down upon the home life as they had done long ago. Miss Laureston was late at breakfast that morning, and Helen, while waiting for her, went up to the picture and stood before it in an idle attitude very much like that of the figure before her. While so gazing, and having forgotten all about breakfast, she was startled by a sharp cry behind her, and looked round to see her aunt, white and trembling, standing in the doorway and looking from her to the picture in a bewildered way that was wholly unaccountable. She called the girl Milly first, and then Helen, and seemed not to know in whose presence she stood; but when Helen would have hurried to her, she begged her to remain where she was. So she stood still, rather frightened, while Miss Laureston looked at the marvellous likeness before her. Line for line, feature for feature, Helen's face and the pictured face were exactly the same, The ages, too, were nearly alike, and no stranger would have doubted that the young girl standing in front of it was the original of the portrait.

Miss Laureston was so shaken that she was unable to think or reason, but she knew in her inmost heart that such a likeness could not be accidental. If Helen was not Milly's child, she must be in some way related to the family, and have drawn her face from the same distant ancestor who had bequeathed it to Milly Laureston. It was hours before she recovered her calmness, and then her first step was to send for the lawyer. To him she showed the likeness, and to him she committed the charge of making every possible search for the relatives or friends of the woman, supposed to be Helen's mother, who had died in so sad a way. She also recalled to his memory the fact that the name on the handkerchief—Camilla—was the same as her sister's, and that the article was of different quality from the rest of the child's clothing.

"You told me, too, that the woman was dark, and in feature wholly unlike Helen, did you not?" she added.

"H'm, yes," said Mr. Adams, as he took in the suggestions of the strange story—"yes, I said so, certainly; but this likeness may be wholly accidental. And there will be great difficulty in finding proof at this distance of time."

Miss Laureston was silent; she felt convinced that the likeness was not an accidental one.

"In fact, there is only one way," continued Mr. Adams—"to put the matter into the hands of private detectives. And I fear that will be very unpleasant to you."

Miss Laureston winced, but gave orders that it should be done immediately.

The next month passed like a dream. Her feeling of the unreality of all that surrounded her, her dread of yielding up Helen to another, waged incessant war with her love for her sister. At times she almost dreaded to find Milly, because she might have a better right than herself to the love of her treasure; at other times she bitterly reproached herself with selfishness and hardness; at all times she was conscious that something, some revolutionary change in her life, was coming to meet her with steady tread, and she could neither evade nor resist it.

At last, one frosty night, a little, dark, alert man, with eyes like an eagle's, presented himself at her door, and she knew that he was a detective, and that he had come with news. It was very quickly told, the story that she had been dreading so long. Mrs. Camilla Beckwith was alive, and was now residing in a town about eighty miles distant. Previous to her second marriage she had been a Mrs. Gessner. Her husband had died in the tenth year of their married life, leaving her with no children and in extreme poverty. Afterward she had married Mr. Beckwith, who had befriended her in her poverty, and who was a gentleman nearly twice her own age, of good means and standing. By him she had one child, which, before it was two years old, had been stolen from her by a sister of her former husband, who had always been violently jealous of the second marriage, and was believed to have been insane. At the same time her husband fell ill with his last sickness, and in the sorrow and confusion of his death speedy search could not at once be made for the child. It was afterward ascertained that the woman had drowned herself, and they never doubted that the little girl perished with her, knowing the hatred she had borne to the child's father. The one passion of her life had been her handsome, dissolute brother Paul, and after his death she had set herself bitterly against the marriage of his widow with any other man. Mrs. Beckwith, the detective added, had been sick for a long time, but finally recovered, and was now leading a quiet, retired life, greatly re-

spected and beloved by the whole neighborhood.

Such, in substance, was the detective's story; and if he knew more than this, if he knew Mrs. Gessner's name before her first marriage, or guessed whose child Miss Helen Laureston really was, he gave no sign of it.

After his departure Miss Laureston sat and thought in sore bewilderment. Not as to her duty, for that was clear; it was to go at once to her sister, and take Helen with her. But that Milly, little Milly, the baby, the willful child, should have gone through such an experience, while her older sister was watching one uneventful year add itself to another in the old quiet house, seemed to her a thing incredible. She had been twice married, she had had a child of her own, and had tried all the depths of bereavement and anguish, and perhaps also its strange strength, for did not the man say that "she was greatly beloved and respected by all who knew her?"

How the words repeated themselves over in Miss Laureston's brain that night, and refused to harmonize with any of her recollections of that lost sister, little Milly, who had been always the weak one, to be taught and protected! And yet the weakness of the one had gone out to battle with many sorrows, while the strength of the other had been left to learn in silence and in safety the lessons of life. In her bewilderment Miss Laureston almost forgot her pain at the thought that any one else had a claim upon Helen.

But morning came, and with it the need of action. She told Helen as gently as possible the story of her life and this late discovery of her mother. It comforted her not a little when the child clung to her and refused to leave her even for the sake of the unknown mother, who was to her only a dream.

In order to reach the town where Milly lived they had to leave home by an early train and travel all day. Miss Laureston held Helen's hand fast in hers when the train rolled into the station after that silent journey. In her confusion she had neglected to find out from the detective exactly where Mrs. Beckwith lived, and though she knew the street, she did not know the house.

It was a quiet country town, so peaceful under the last light of the setting sun that the trouble unconsciously slipped from her heart as they walked together up the elm-bordered street. But she still kept Helen's hand in hers, and did not let it go even when they saw the name they had come to find, and turned up into the shady street where Milly lived.

"Now we must ask where Mrs. Beckwith lives, auntie," said Helen, her voice trembling in spite of her. "These seem to be houses of poor people along here. Shall we stop at one of them, or go further on?"

"Stop here, Helen," said Miss Laureston, eagerly. "They will not notice us as other people would."

So they went up to the nearest house, a very humble cottage, and asked a rough-looking man who sat smoking a pipe at the door if he knew where Mrs. Beckwith lived.

"Mrs. Beckwith?" repeated the man, slowly—"do I know where Mrs. Beckwith lives? Just you step in here, mistress, a minute."

Miss Laureston hesitated; but Helen had noticed the glow that shone over the man's stolid face, and drew her on.

When they were inside the rude door, the man lifted a sort of curtain which was the only separation between that and an inner room.

"Just you look here, mistress," he said, again; and following his motions, they saw a little boy, fearfully deformed, who could not have been more than seven years old, lying on a low bed. His restless hand was grasping at some flowers that lay scattered on his breast, and, in strange contrast with the poor house, a lovely Madonna looked down upon the suffering child.

The man's hand shook a little as he grasped the curtain. "It's all her doings—the posies and the other things," he whispered hoarsely, not to disturb the boy. "Me and wife can't count the nights that she's sat here when the boy were wild wi' the pain; an' the saints knew it were as good for him to look at her face as the holy face up there," crossing himself as he looked up at the Madonna.

"Do you mean Mrs. Beckwith?" asked Helen, for her aunt did not speak.

"Sure, who else could I mean? There's not her like here in the whole country round. The widow Reilly, that's next door, knows it too, for her boy and girl ran wild till Mrs. Beckwith found them, and just dressed them up and sent them off to school. There's never a house in all the town, if trouble comes in at the door, that the dear lady doesn't follow hard after. Does I know Mrs. Beckwith? Our Lady up there knows her, if I don't"—with another look at the picture.

"There, there, the mistress only wants to know where Mrs. Beckwith lives," interposed his wife, soothingly.

The man dropped the curtain and turned away, still muttering to himself, while she followed them to the door and told them how far to go and what houses they must pass before they came to Mrs. Beckwith's.

They had no trouble in finding it; it was a large quiet house, deeply set among the trees. They waited a few minutes in the dim parlor, and a lady came softly in through the door. A lady with silvered hair, in a silver-gray dress, with the sober-

ness of age lightly resting on her like a blessing. Could that be the child Milly? Miss Laureston stood in silence before her, while Mrs. Beckwith looked from the young girl to the elderly white-haired lady who held her hand so closely.

With their youth far behind them, and twenty-five years crowding in between them, Agnes and Milly Laureston were face to face again. And the calm strength of the one bowed down before the patient humility of the other. "Beloved and respected by all!" It was so, indeed; toil and poverty and pain had borne witness to it. The child's weakness had grown into the woman's strength, the child's folly to the woman's wisdom. "Milly, Milly," whispered Agnes, and felt her sister's arms round her neck before the words left her lips.

Only one prayer had Milly—to be forgiven for the wrong she did in leaving her sister; only one feeling, when the long story was told and her lost child given back to her—a gratitude and blessing for her sister that all loving words and caresses failed to make known.

Yet even with Milly's hands clasping hers, Miss Laureston's eyes wandered constantly to Helen, and all her thoughts were trembling round the fear that Milly would take Helen away from her.

"You will come and live with me now, Milly, will you not?" she asked at last, putting the question with intense dread; for if her sister said No, would it not be natural that she should expect her daughter to stay with her?

Mrs. Beckwith looked up and saw two anxious faces—the sister's she had left, and the daughter's she had never known—waiting for her answer; saw and understood that they were more to each other than she could be to either of them. Her lips quivered a little as she asked, wistfully, "Are you afraid I shall want to take your little girl away from you? I will go with you, Agnes, any where that you wish. I was wrong when I would not stay with you before, and now I will try to make up for it."

She raised her face to kiss her sister, sober, middle-aged lady that she was, in the very same humble way that she used to do in her childhood, and Agnes understood a little of the love that must go out before love of others can come in.

But she never understood in all her life the simple self-sacrifice with which Milly gave her child over to the sister whose life was in her, and consented to go to the home where she would take only a second place, as in the days of her girlhood, and could be first in the heart neither of sister nor child. Milly only said to herself how natural it was that they should love each other best, and took the pain into her own heart rather than throw a shadow of it upon them.

Miss Laureston and Helen staid with her for several weeks, and when they went home, she went with them. In that time something of the strangeness which separated them had worn away. The old house received them back to itself, and the picture of the Angel Gabriel watched over its happy Christmas as it had watched over the lonely one fifteen years ago. On dark nights, when the fire-light shone brightly, the window again threw back the figures of the two sisters, the one white-haired, the other gray-haired, both going down to old age peacefully, while that young and beloved life climbed the morning slopes beside them.

Harry was away at college now, and now and then looked at Helen's picture as if he might some time come to think it prettier than any other face in the world; but before that time came, his child-sister had fallen asleep with the immortal beauty on her face, and left to Harry and Helen only a dear memory sacred forever from all rivalry of earthly loveliness.

CRIME AND TRAMPS.

THOSE who seek to check crime, to make life and property safe, and to secure the rule of good morals, must study with care the causes of the lower grades of offenses. They are the most frequent, most hurtful from their numbers, and the most difficult to control. Vagrancy, petty thefts, and disorders lead to murders, arson, and robbery. When crime reaches these proportions an aroused community usually searches out and punishes the offenders. For this class of criminals our laws are well enough, and are fairly enforced. The great trouble is to work out some system which shall check the course of those who are entering upon lives of disorderly and criminal aspects, and who have been guilty of petty breaches of the law. To do this we must rely in the first place upon the exercise of our religious, moral, and social duties; and in the next place upon the laws we frame to punish this class of wrong-doers.

I shall only speak at this time of the laws of our State—what they are, and what they should be. A class of men known as "tramps" has suddenly sprung up in great numbers, and we are at a loss in what way to deal with them. We feel that they are a great and growing danger. They make life and property unsafe in parts of our country which have heretofore been free from such evils. Not only our towns, but the solitary homes of our farmers are annoyed by these visitors, who mean to live upon the community either by beggary or theft. This dangerous class not only increases in number, but it is rapidly gaining a kind of organization, and is growing into a system of

brigandage. They crowd to every scene of disorder or disaster, and greatly add to the difficulties of enforcing laws. They have systems of communication and intercourse, which are made more perfect each year. What is the origin of this class of men? What has called it into existence as an organized body hostile to industry and social order? Not alone the state of our country, for while there is at this time a measure of business distress, yet it is still true that these men could easily earn with a little labor the food and clothes which they pick up by beggary and theft. It will be found that they are the outgrowth of those very laws to which we look for protection.

Crime should be punished with certainty, and in a way that will make men shrink from its commission, that will degrade them as little as possible, and that will tend to make them better. All will agree to these rules, but our practice violates each one of them.

In Delaware the whipping-post is still in use. We are shocked at its brutal aspects, and charge upon the people of that State that they cherish a relic of barbarism. We then complacently shut our eyes to the evils of our own laws. While the laws of Delaware are offensive, it is still true that our way is more brutal, more hurtful to the health and morals of wrong-doers; so far from checking crime, it nourishes vice, and teaches the arts by which bad men can prey upon the public. Let us compare the two systems as to their physical effects, and we shall find that while one is bad, the other is worse. The sharp pain of the lash and its marks upon the body of a man shock us. These are always seen and felt by the bystander, and tend to check excessive punishment. This is a safeguard against brutality. Harm to the health rarely follows this kind of punishment; and its advocates claim, with some force, that every substitute which is less revolting has always proved to be more hurtful, because it does not in its aspects give warning of lasting or fatal results.

Without running through the list of these, let us look at our jails. For weeks or months men shut up in them are cut off from fresh air or exercise, in almost every case living in a way that not only breeds diseases hurtful to them, but in many cases sowing the seeds of pestilences which have swept vast numbers of innocent persons into their graves. Jail fevers are frequently noted in the histories of England when the modes of life of its people favored the spread of epidemics. We do not know how often these give birth to pestilences which are carried into the families of the discharged convicts, or into the homes of all classes of our citizens in the clothing of the vagrant tramp made virulent by his unclean mode of life.

If we look at the mere physical effects of punishment, the lash is less repulsive than foul diseases. There is an after-evil following the vile air and the pestilential life of our jails. Those who come out of them are unfit for a time to do any honest work. Physical prostration demands stimulants, and jails will make drunkards of those who have before been sober men. It is to be said of the use of the whip that it is far less dangerous to life and health than any other punishment. Its effects are upon the surface, where they can be seen, and that, too, in a way calculated to hold back the hand that wields it. Every thing used in its place by those ignorant of the structure of the human body has proved to be injurious to life, health, and intellect. The darkness of cells, the shocks from streams of water, painful positions, and the whole list of substitutes have caused the most terrible results. I think medical men will agree with this statement. The man who suffers from the lash goes from his punishment with a sense of the evils which follow wrong-doing. He is not taught any new devices in crime, nor made as shameless or as hardened as the poor wretch who is kept for months in the crowded school-room of vice, where the moral atmosphere is as fetid as the air he breathes.

Those with whom alone he can talk, and with whom he is forced into close contact by prison walls, are offenders of all grades of guilt, from the timorous young who have taken their first steps in wrong-doing to the old and hardened offender who boasts of his deeds. During the whole time they are thus kept caged up they are gazed at through the prison bars by the curious, and scoffed at by the unfeeling, till they are forced in self-defense to become shameless, and taught to hurl back the words of scorn which are prompted by the evil passions of hate and vengeance which their positions excite in their minds. Yet in the face of these truths we speak of our laws and of our jails as our reliances for checking crime and reforming offenders. Will any one say that he who comes out from these prison walls is less degraded in his own eyes or those of the public, less hardened in vice, than the man who has undergone the sharp but short pain of the lash? The real evil of the whipping-post is not the harm done to the criminal, but to the lookers-on.

There is another rule which we all see which must be followed if we are to prevent crime. Its punishments must be of a kind which men shrink from. Is that true of our jails? In some cases it is, when men first fall into vicious ways. But more than half of those who are sent to them care but little for the shame, and many of them look to them as places of shelter from want, as homes where they can get food and warmth.

The dread of the jail is usually felt but once; the dread of the lash is felt every time that the man sees that his conduct may bring him under its sharp stings. But my object is not to commend the whipping-post, but to show that we have something worse in our plans for punishment. I protest against both systems, but I wish to make clear our follies by comparing them with acts against which we cry out in the name of humanity.

While Governor of this State I learned that the suffering for crime, as a rule, fell not upon the offender, but upon his family. When I look over our penal laws, their titles, to my mind, read between their lines, "*Acts to punish wives and children of those who violate their terms.*" I was constantly appealed to to pardon convicts for these reasons, and in some cases by the wives of those who made the complaints upon which the wrong-doer was convicted. When this was told to them, their answer was, that while that was true, yet when the husbands were in jail, where they were fed and warmed, their wives and children were left to starve and freeze for want of support.

There is no perfect way of dealing with crime, but there is no worse way than the system of this State. Some years ago a leading lawyer of New York travelled through Egypt. He met the chief of a wandering tribe of the desert, and, among other things, he told this wild ruler of our laws, and the ways we dealt with crime. He was heard with astonishment, and for the first time he himself was struck with their absurdities. After his return he used to say that he was never so thoroughly ashamed of his country as when he was telling his simple-minded auditor what laws we had upon these subjects, and how they were enforced.

While we may not frame perfect systems, much can be done to make a better state of things—to simplify justice and to break up the tendency to disorderly conduct and to vagrancy. We can not hope to make any marked improvement in our jails. Each county must have one, and its population will determine the character of its place of confinement. Those in charge of them will be frequently changed, and save in the large cities the number and character of the inmates will not admit of classification, etc.

The first change should be one that will allow our judges to impose punishments other than sending the offenders to these common schools of vice.

As nothing can be worse than our present laws, there can be no harm in trying new plans. We must have jails, as there are cases when the safety of society makes it necessary to lock men up. But, as a rule, other restraints can be used which will check, not teach, crime. Our laws only allow two punishments to be inflicted for minor offenses—fines or imprisonment—and these must be imposed without regard to age, sex, condition, or circumstances. The law demands these, it matters not what moral or material mischief they may do. As a rule, fines inflict distress on families and friends, while jails are a gateway to a course of wickedness which leads to the State-prisons. For these reasons no punishments are inflicted until the offenders have grown into hardened criminals who excite no sympathy. There is no power to deal in a right way with the first step in crime, with acts of mingled error and wrong-doing. It has been my duty to look into a great number of such cases, and I have given much thought and study to our statutes with regard to them. Next to moral and religious influences, we must rely upon the wisdom of our laws with regard to youthful offenders. It is comparatively an easy matter to deal with grave crimes.

The first step toward reform is to give magistrates a right, within certain limits, to direct such punishments as they shall see are best fitted to reform wrong-doers. They have all the facts before them, and best know what is just and right in each case. This will not give them undue powers, but it will take away pretexts for not doing their duty. Now they must fine, or imprison, or discharge. In many cases either of these courses is unsuitable, and many wrong-doers go free, for to enforce law would only make things worse.

This state of things is full of evil. If magistrates could bind them out to do work, or direct the minors to be chastised by parents or guardians or suitable persons, many would be saved from the moral leprosy which infects our jails. Such or like punishments would be inflicted, and there would be no excuse for letting offenders escape.

Magistrates should have in addition to their present powers the same right of control over vagrants, disorderly persons, and habitual offenders which parents or guardians have over their children or wards. The fact that they belong to these classes should be judicially decided after a certain number of convictions. When they are thus enrolled in these classes, they should have no right to vote at any election. As our laws now stand, notorious offenders who do no honest work, who can only live in immoral ways, are held to be innocent persons, when they are arrested, until the formal, technical, and sometimes expensive proofs are furnished that they are guilty of practices which there is a moral certainty they indulge in. This is right when they are accused of grave crimes. But there is no hardship in putting such persons into that state of wardship in which the law places all persons who are under the age

of twenty-one years, or who are afflicted with disordered minds. Should disorderly morals be more leniently dealt with than disordered intellects?

There is no danger in giving magistrates the power over habitual offenders which parents and guardians have over minors—that of making them work, of binding them out, and of locking them up; and, in the case of children, having them chastised rather than sent to jails. There is no reason to fear that this punishment will be used too often or too harshly. It would rarely be applied, but should not be made illegal, as it would give magistrates great control, and would do much to put an end to the bravado and swagger of disorderly boys which are so much admired by their weak or youthful companions.

It is a great crime to send youthful offenders to those pest-houses of vice—our jails. While our reformatories do much good, they do not check the first steps in wrong-doing. It is sheer cant which cries out against saving young boys from vice by the action of magistrates in the same way that the teacher saves his pupil, or the guardian the ward under his care.

We need laws which will check rather than those which will punish wrong-doing. No man in his brutal rage will whip his helpless wife when he knows that his guilty act will suggest to the magistrate what should be done to him. Is it not time that the State should cease to educate men in crime; should cease to foster disorder and vagrancy, and to send out armies of tramps to make country life and property unsafe? These evils can in a good degree be corrected if we will change our laws and give our magistrates the power and discretion they ought to have. By doing this we shall not only check crime, but lessen the cost and trouble of administering justice. To get rid of these the towns are in the habit of pushing off vagrants and disorderly persons upon each other, and they thus set in motion the army of tramps. If each town had a cheap lock-up where such men could be sent and made for a few days to do some useful work, such as breaking stone, we should soon be freed from a dangerous and growing class of wanderers.

Broken stone is always needed for roads in the country, and the supply thus gained would do much toward paying the cost of this branch of administration. What I have suggested may not be wise. But one thing is clear: the evils of which I have spoken will grow more serious until we get rid of technical rules and ideas, which we cling to only because custom has made them valuable in our eyes, and blinded us to the fact that they make rather than check vice.

Those who have charge of revising our statutes urge some valuable changes with regard to felonies. They would have those who have been convicted more than once declared "*habitual offenders*," who shall at all times be under the supervision of the police. This is a wise suggestion. But it is still more important to make offenders the wards of the magistrates at the outset of their careers than it is to wait until they have become hardened criminals. This supervision should not merely be used to thwart the designs of old offenders, but it should also be adopted to check and reform that more numerous class of disorderly persons who furnish the men who commit the murders, the arson, the burglaries, and other desperate acts which make life and property unsafe.

JOSEPH, THE NEZ PERCÉ.

From the northern desolation
Comes a cry of exultation:
"It is ended. He has yielded. And the stubborn fight is won!"
Let the nation in its glory
Bow with shame before the story
Of the hero it has ruined and the evil it has done.

How he prayed while hope remained,
Though the white man's hands were stained
With the blood that cried for vengeance of his murdered kin and clan,
For the home the good God gave him,
And the treaty sworn to save him,
For the shelter of his children, for the right to be a man.

Then the troops began to hound him,
And he wrapped his blanket round him,
And he called his braves to follow, and he smote them hip and thigh.
But the hosts grew vast and vaster,
And the whirlwind of disaster
Drove him out into the mountains and beneath an alien sky.

Through the continental ridges,
Over tottering torrent bridges,
By the verge of black abysses, in the shade of mountains hoar;
Herds and wives and children bearing,
Months he journeyed, toiling, daring,
With an army trailed behind him and another crouched before.

Thrice the sudden blow descended,
Roar and flash and clashing blended;
Twice his rear-guard faced and checked them till the hunted tribe were free.
Once he reeled, but swiftly rallied,
Forth upon the spoilers sallied,
Drove them headlong into shelter, captured all their cannonry.

But the mountains could not shield him,
And the snowy heights revealed him,
And the false friends would not aid him, and his goal was far away;
Burdened by his weak and wounded,
Stripped and harried and surrounded,
Still the chieftain of the Northland, like a lion, stood at bay.

From the freedom that he sought for,
From the dear land that he fought for,
He is riven by a nation that has spurned its plighted word;
By the Christians who have given
To the heathen—gracious Heaven!—
With the one hand theft and falsehood, with the other ball and sword.

MACLEOD OF DARE.

CHAPTER XL.

DREAMS.

THIS long and terrible night: will it never end? Or will not life itself go out, and let the sufferer have rest? The slow and sleepless hours toil through the darkness; and there is a ticking of a clock in the hushed room; and this agony of pain still throbbing and throbbing in the breaking heart. And then, as the pale dawn shows gray in the windows, the anguish of despair follows him even into the wan realms of sleep, and there are wild visions rising before the sick brain. Strange visions these are; the confused and seething phantasmagoria of a shattered life; himself regarding himself as another figure, and beginning to pity this poor wretch who is not permitted to die. "Poor wretch! poor wretch!" he says to himself. "Did they use to call you Macleod; and what is it that has brought you to this?"

* * * * * *

See now! He lays his head down on the warm heather, on this beautiful summer day; and the seas are all blue around him, and the sun is shining on the white sands of Iona. Far below, the men are singing "Fhir a bhata" and the sea-birds are softly calling. But suddenly there is a horror in his brain; and the day grows black; for an adder has stung him! it is *Righinn*—the Princess—the Queen of Snakes. Oh, why does she laugh, and look at him so with that clear, cruel look? He would rather not go into this still house where the lidless-eyed creatures are lying in their awful sleep. Why does she laugh? Is it a matter for laughing that a man should be stung by an adder, and all his life grow black around him? For it is then that they put him in a grave; and she—she stands with her foot on it! There is moonlight around, and the jackdaws are wheeling overhead; our voices sound hollow in these dark ruins. But you can hear this, sweetheart: shall I whisper it to you? "*You are standing on the grave of Macleod.*"

* * * * * *

Lo! the grave opens! Why, Hamish, it was no grave at all, but only the long winter; and now we are all looking at a strange thing away in the south, for who ever saw all the beautiful flags before that are fluttering there in the summer wind? O sweetheart! your hand—give me your small, warm, white hand. See! we will go up the steep path by the rocks; and here is the small white house; and have you never seen so great a telescope before? And is it all a haze of heat over the sea, or can you make out the quivering phantom of the light-house—the small gray thing out at the edge of the world? Look! they are signaling now; they know you are here: come out, quick! to the great white boards, and we will send them over a message, and you will see that they will send back a thousand welcomes to the young bride. Our ways are poor; we have no satin bowers to show you, as the old songs say; but do you know who are coming to wait on you? The beautiful women out of the old songs are coming to be your handmaidens—I have asked them—I saw them in many dreams—I spoke gently to them—and they are coming. Do you see them? There is the bonnie Lizzie Lindsay, who kilted her coats o' green satin to be off with young Macdonald; and Burd Helen—she will come to you pale and beautiful; and proud Lady Maisry that was burned for her true love's sake; and Mary Scott of Yarrow that set all men's hearts aflame. See, they will take you by the hand. They are the Queen's Maries. There is no other grandeur at Castle Dare.

* * * * * *

Is this Macleod? They used to say that Macleod was a man! They used to say he had not much fear of any thing. But this is only a poor trembling boy—a coward trembling at every thing, and going away to London with a lie on his lips. And they know how Sholto Macleod died, and how Roderick Macleod died, and Ronald, and Duncan the Fair-haired, and Hector; but the last of them—this poor wretch—what will they say of him? "Oh, he died for the love of a woman!" She struck him in the heart, and he could not strike back, for she was a woman. Ah, but if it was a man, now! They say the Macleods are all become sheep, and their courage has gone, and if they were to grasp even a Rose Leaf they could not crush it. It is dangerous to say that; do not trust to it. Oh, is it you, you poor fool in the newspaper, who are whirling along behind the boat? Does the swivel work? Are the sharks after you? Do you hear them behind you, cleaving the water? The men of Dubh Artach will have a good laugh when we whisk you past. What! you beg for mercy?—come out, then, you poor devil! Here is a tarpaulin for you. Give him a glass of whiskey, John Cameron. And so you know about theatres; and perhaps you have ambition too; and there is nothing in the world so fine as people clapping their hands? But you—even you—if I were to take you over in the dark, and the storm came on: you would not think that I thrust you aside to look after myself? You are a stranger; you are helpless in boats: do you think I would thrust you aside? It was not fair—oh, it was not fair: if she

wished to kill my heart, there were other things to say than that. Why, sweetheart, don't you know that I got the little English boy out of the water; and you think I would let you drown! If we were both drowning, now, do you know what I should do? I should laugh, and say, "Sweetheart, sweetheart, if we were not to be together in life, we are now in death, and that is enough for me."

* * * * * *

What is the slow, sad sound that one hears? The grave is on the lonely island; there is no one left on the island now; there is nothing but the grave. "*Man that is born of a woman hath but a short time to live, and is full of misery.*" Oh no, not that! That is all over; the misery is over, and there is peace. This is the sound of the sea-birds, and the wind coming over the seas, and the waves on the rocks. Or is it Donald, in the boat, going back to the land? The people have their heads bent; it is a Lament the boy is playing. And how will you play the "Comhadh na Cloinne" to-night, Donald?—and what will the mother say? It is six sons she has to think of now; and Patrick Mòr had but seven dead when he wrote the Lament of the Children. Janet, see to her! Tell her it is no matter now; the peace has come; the misery is over; there is only the quiet sound of the waves. But you, Donald, come here. Put down your pipes, and listen. Do you remember the English lady who was here in the summer-time; and your pipes were too loud for her, and were taken away? She is coming again. She will try to put her foot on my grave. But you will watch for her coming, Donald; and you will go quickly to Hamish; and Hamish will go down to the shore, and send her back. You are only a boy, Donald; she would not heed you; and the ladies at the castle are too gentle, and would give her fair words; but Hamish is not afraid of her; he will drive her back—she shall not put her foot on my grave; for my heart can bear no more pain.

* * * * * *

And are you going away—*Rose Leaf—Rose Leaf*—are you sailing away from me on the smooth waters to the south? I put out my hand to you; but you are afraid of the hard hands of the northern people, and you shrink from me. Do you think we would harm you, then, that you tremble so? The savage days are gone; come—we will show you the beautiful islands in the summer-time; and you will take high courage, and become yourself a Macleod; and all the people will be proud to hear of Fionaghal the Fair Stranger who has come to make her home among us. Oh, our hands are gentle enough when it is a Rose Leaf they have to touch. There was blood on them in the old days; we have washed it off now: see—this beautiful red rose you have given me is not afraid of rough hands! We have no beautiful roses to give you, but we will give you a piece of white heather, and that will secure to you peace and rest and a happy heart all your days. You will not touch it, sweetheart? Do not be afraid! There is no adder in it. But if you were to find, now, a white adder, would you know what to do with it? There was a sweetheart in an old song knew what to do with an adder. Do you know the song? The young man goes back to his home, and he says to his mother, "O make my bed soon; For I'm weary, weary hunting, and fain would lie doon." Why do you turn so pale, sweetheart? There is the whiteness of a white adder in your cheeks; and your eyes—there is Death in your eyes! Donald!—Hamish! help! help!—her foot is coming near to my grave! —my heart—

And so, in a paroxysm of wild terror and pain, he awoke again, and behold, the ghastly white daylight was in the room—the cold glare of a day he would fain have never seen. It was all in a sort of dream that this haggard-faced man dressed, and drank a cup of tea, and got outside into the rain—the rain, and the noise of the cabs, and the gloom of London skies: these harsh and commonplace things were easier to bear than the dreams of the sick brain. And then, somehow or other, he got his way down to Aldershot, and sought out Norman Ogilvie.

"Macleod!" Ogilvie cried, startled beyond measure by his appearance.

"I—I wanted to shake hands with you, Ogilvie, before I am going," said this hollow-eyed man, who seemed to have grown old.

Ogilvie hesitated for a second or two; and then he said, vehemently:

"Well, Macleod, I am not a sentimental chap, but—but—hang it! it is too bad. And again and again I have thought of writing to you, as your friend, just within the last week or so; and then I said to myself, that tale-bearing never came to any good. But she won't darken Mrs. Ross's door again—that I know. Mrs. Ross went straight to her the other day. There is no nonsense about that woman. And when she got to understand that the story was true, she let Miss White know that she considered you to be a friend of hers, and that—well, you know how women give hints—"

"But I don't know what you mean, Ogilvie," he cried, quite bewildered. "Is it a thing for all the world to know? What story is it—when I knew nothing till yesterday?"

"Well, you know now: I saw by your face a minute ago that she had told you the truth at last," Ogilvie said. "Macleod, don't blame me. When I heard of her being about to be married, I did not believe the story—"

Macleod sprang at him like a tiger, and caught his arm with the grip of a vise.

"Her getting married?—to whom?"

"Why, don't you know?" Ogilvie said, with his eyes staring. "Oh yes, you must know. I see you know. Why, the look in your face when you came into this room—"

"Who is the man, Ogilvie?"—and there was the sudden hate of ten thousand devils in his eyes.

"Why, it is that artist fellow—Lemuel. You don't mean to say she hasn't told you? It is the common story. And Mrs. Ross thought it was only a piece of nonsense—she said they were always making out those stories about actresses—but she went to Miss White. And when Miss White could not deny it, Mrs. Ross said there and then they had better let their friendship drop. Macleod, I would have written to you—upon my soul, I would have written to you—but how could I imagine you did not know? And do you really mean to say she has not told you any thing of what has been going on recently—what was well known to every body?"

And this young man spoke in a passion too: Keith Macleod was his friend. But Macleod himself seemed, with some powerful effort of will, to have got the better of his sudden and fierce hate; he sat down again; he spoke in a low voice; but there was a dark look in his eyes.

"No," said he, slowly, "she has not told me all about it. Well, she did tell me about a poor creature—a woman-man—a thing of affectation, with his paint-box and his velvet coat and his furniture: Ogilvie, have you got any brandy?"

Ogilvie rang, and got some brandy, some water, a tumbler, and a wine-glass placed on the table. Macleod, with a hand that trembled violently, filled the tumbler half full with brandy.

"And she could not deny the story to Mrs. Ross?" said he, with a strange and hard smile on his face. "It was her modesty. Ah, you don't know, Ogilvie, what an exalted soul she has. She is full of idealisms. She could not explain all that to Mrs. Ross. *I* know. And when she found herself too weak to carry out her aspirations, she sought help. Is that it? She would gain assurance and courage from the woman-man?"

He pushed the tumbler away; his hand was still trembling violently.

"I will not touch that, Ogilvie," said he, "for I have not much mastery over myself. I am going away now—I am going back now to the Highlands. Oh! you do not know what I have become since I met that woman—a coward and a liar! They wouldn't have you sit down at the mess table, Ogilvie, if you were that: would they? I dare not stay in London now. I must run away now—like a hare that is hunted. It would not be good for her or for me that I should stay any longer in London."

He rose, and held out his hand: there was a curious glazed look on his eyes. Ogilvie pressed him back into the chair again.

"You are not going out in this condition, Macleod—you don't know what you are doing. Come now, let us be reasonable; let us talk over the thing like men. And I must say, first of all, that I am heartily glad of it, for your sake. It will be a hard twist at first; but, bless you! lots of fellows have had to fight through the same thing, and they come up smiling after it, and you would scarcely know the difference. Don't imagine I am surprised:—oh no. I never did believe in that young woman; I thought she was a deuced sight too clever; and when she used to go about humbugging this one and the other with her innocent airs, I said to myself, 'Oh, it's all very well; but *you* know what you are about.' Of course there was no use talking to you. I believe at one time Mrs. Ross was considering the point whether she ought not to give you a hint, seeing that you had met Miss White first at her house, that the young lady was rather clever at flirtation, and that you ought to keep a sharp look-out. But then you would only have blazed up in anger. It was no use talking to you. And then, after all, I said that if you were so bent on marrying her, the chances were that you would have no difficulty, for I thought the bribe of her being called Lady Macleod would be enough for any actress. As for this man Lemuel, no doubt he is a very great man, as people say; but I don't know much about these things myself; and—and—I think it is very plucky of Mrs. Ross to cut off two of her lions at one stroke. It shows she must have taken an uncommon liking for you. So you must cheer up, Macleod. If women take a fancy to you like that, you'll easily get a better wife than Miss White would have made. Mind you, I don't go back from any thing I ever said of her. She is a handsome woman, and no mistake; and I will say that she is the best waltzer that I ever met with in the whole course of my life—without exception. But she's the sort of woman who, if I married her, would want some looking after—I mean, that is my impression. The fact is, Macleod, away there in Mull you have been brought up too much on books and your own imagination. You were ready to believe any pretty woman, with soft English ways, an angel. Well, you have had a twister; but you'll come through it; and you will get to believe, after all, that women are very good creatures, just as men are very good creatures, when you get the right sort. Come now, Macleod, pull yourself together. Perhaps I have just as hard an opinion of her conduct toward you as you

have yourself. But you know what Tommy Moore, or some fellow like that, says: 'Though she be not fair to me, what the devil care I how fair she be?' And if I were you I would have a drop of brandy—but not half a tumblerful."

But neither Lieutenant Ogilvie's pert common-sense, nor his apt and accurate quotation, nor the proffered brandy, seemed to alter much the mood of this haggard-faced man. He rose.

"I think I am going now," said he, in a low voice. "You won't take it unkindly, Ogilvie, that I don't stop to talk with you. It is a strange story you have told me—I want time to think over it. Good-by."

"The fact is, Macleod," Ogilvie stammered, as he regarded his friend's face, "I don't like to leave you. Won't you stay and dine with our fellows? Or shall I see if I can run up to London with you?"

"No, thank you, Ogilvie," said he. "And have you any message for the mother and Janet?"

"Oh, I hope you will remember me most kindly to them. At least I will go to the station with you, Macleod."

"Thank you, Ogilvie; but I would rather go alone. Good-by, now."

He shook hands with his friend—in an absent sort of way—and left. But while yet his hand was on the door, he turned and said,

"Oh, do you remember my gun that has the shot barrel and the rifle barrel?"

"Yes, certainly."

"And would you like to have that, Ogilvie?—we sometimes had it when we were out together."

"Do you think I would take your gun from you, Macleod?" said the other. "And you will soon have plenty of use for it now."

"Good-by, then, Ogilvie," said he; and he left, and went out into the world of rain and lowering skies and darkening moors.

And when he went back to Dare it was a wet day also; but he was very cheerful; and he had a friendly word for all whom he met; and he told the mother and Janet that he had got home at last, and meant to go no more a-roving. But that evening, after dinner, when Donald began to play the Lament for the memory of the five sons of Dare, Macleod gave a sort of stifled cry, and there were tears running down his cheeks—which was a strange thing for a man; and he rose and left the hall, just as a woman would have done. And his mother sat there, cold, and pale, and trembling; but the gentle cousin Janet called out, with a piteous trouble in her eyes:

"Oh, auntie, have you seen the look on our Keith's face ever since he came ashore to-day?"

"I know it, Janet," said she. "I have seen it. That woman has broken his heart—and he is the last of my six brave lads."

They could not speak any more now; for Donald had come up the hall; and he was playing the wild, sad wail of the "Cumhadh na Cloinne."

CHAPTER XLI.

A LAST HOPE.

THOSE sleepless nights of passionate yearning and despair—those days of sullen gloom broken only by wild cravings for revenge that went through his brain like spasms of fire: these were killing this man. His face grew haggard and gray; his eyes morose and hopeless; he shunned people as if he feared their scrutiny; he brooded over the past in a silence he did not wish to have broken by any human voice. This was no longer Macleod of Dare. It was the wreck of a man—drifting no one knew whither.

And in those dark and morbid reveries there was no longer any bewilderment. He saw clearly how he had been tricked and played with. He understood now the coldness she had shown on coming to Dare; her desire to get away again; her impatience with his appeals; her anxiety that communication between them should be solely by letter. "Yes, yes," he would say to himself—and sometimes he would laugh aloud in the solitude of the hills—"she was prudent. She was a woman of the world, as Stuart used to say. She would not quite throw me off—she would not be quite frank with me—until she had made sure of the other. And in her trouble of doubt, when she was trying to be better than herself, and anxious to have guidance, *that* was the guide she turned to—the woman-man, the dabbler in paint-boxes, the critic of carpets and wall-papers!"

Sometimes he grew to hate her. She had destroyed the world for him. She had destroyed his faith in the honesty and honor of womanhood. She had played with him as with a toy—a fancy of the brain—and threw him aside when something new was presented to her. And when a man is stung by a white adder, does he not turn and stamp with his heel? Is he not bound to crush the creature out of existence, to keep God's earth and the free sunlight sweet and pure?

But then—but then—the beauty of her! In dreams he heard her low, sweet laugh again; he saw the beautiful brown hair; he surrendered to the irresistible witchery of the clear and lovely eyes. What would not a man give for one last, wild kiss of the laughing and half-parted lips? His life? And if that life happened to be a mere broken and useless thing—a hateful thing—would he not gladly and proudly fling

it away? One long, lingering, despairing kiss; and then a deep draught of Death's black wine!

One day he was riding down to the fishing station when he met John MacIntyre the postman, who handed him a letter, and passed on. Macleod opened this letter with some trepidation, for it was from London; but it was in Norman Ogilvie's handwriting.

"DEAR MACLEOD,—I thought you might like to hear the latest news. I cut the inclosed from a sort of half-sporting, half-theatrical paper our fellows get; no doubt the paragraph is true enough. And I wish it was well over and done with, and she married out of hand; for I know until that is so, you will be torturing yourself with all sorts of projects and fancies. Good-by, old fellow. I suppose when you offered me the gun, you thought your life had collapsed altogether, and that you would have no further use for any thing. But no doubt, after the first shock, you have thought better of that. How are the birds? I hear rather bad accounts from Ross; but then he is always complaining about something.

"Yours sincerely,

"NORMAN OGILVIE."

And then he unfolded the newspaper cutting which Ogilvie had inclosed. The paragraph of gossip announced that the Piccadilly Theatre would shortly be closed for repairs; but that the projected provincial tour of the company had been abandoned. On the re-opening of the theatre, a play, which was now in preparation, written by Mr. Gregory Lemuel, would be produced. "It is understood," continued the newsman, "that Miss Gertrude White, the young and gifted actress who has been the chief attraction at the Piccadilly Theatre for two years back, is shortly to be married to Mr. L. Lemuel, the well-known artist; but the public have no reason to fear the withdrawal from the stage of so popular a favorite; for she has consented to take the chief *rôle* in the new play, which is said to be of a tragic nature."

Macleod put the letter and its inclosure into his pocket, and rode on. The hand that held the bridle shook somewhat; that was all.

He met Hamish.

"Oh, Hamish!" he cried, quite gayly. "Hamish, will you go to the wedding?"

"What wedding, Sir?" said the old man; but well he knew. If there was any one blind to what had been going on, that was not Hamish; and again and again he had in his heart cursed the English traitoress who had destroyed his master's peace.

"Why, do you not remember the English lady that was here not so long ago? And she is going to be married. And would you like to go to the wedding, Hamish?"

He scarcely seemed to know what he was saying in this wild way; there was a strange look in his eyes, though apparently he was very merry. And this was the first word he had uttered about Gertrude White to any living being at Dare ever since his last return from the south.

Now what was Hamish's answer to this gay invitation? The Gaelic tongue is almost devoid of those meaningless expletives which, in other languages, express mere annoyance or temper. When a Highlander swears, he usually swears in English. But the Gaelic curse is a much more solemn and deliberate affair.

"*May her soul dwell in the lowermost hall of perdition!*"—that was the answer that Hamish made; and there was a blaze of anger in the keen eyes and in the proud and handsome face.

"Oh yes," continued the old man in his native tongue, and he spoke rapidly and passionately, "I am only a serving-man; and perhaps a serving-man ought not to speak; but perhaps sometimes he will speak. And have I not seen it all, Sir Keith?—and no more of the pink letters coming; and you going about a changed man, as if there was nothing more in life for you? And now you ask me if I will go to the wedding! And what do I say to you, Sir Keith? I say this to you—that the woman is not now living who will put that shame on Macleod of Dare!"

Macleod regarded the old man's angry vehemence almost indifferently: he had grown to pay little heed to any thing around him.

"Oh yes, it is a fine thing for the English lady," said Hamish, with the same proud fierceness, "to come here and amuse herself. But she does not know the Mull men yet. Do you think, Sir Keith, that any one of your forefathers would have had this shame put upon him? I think not. I think he would have said, 'Come, lads, here is a proud madam that does not know that a man's will is stronger than a woman's will; and we will teach her a lesson. And before she has learned that lesson, she will discover that it is not safe to trifle with a Macleod of Dare.' And you ask me if I will go to the wedding! I have known you since you were a child, Sir Keith, and I put the first gun in your hand, and I saw you catch your first salmon; it is not right to laugh at an old man."

"Laughing at you, Hamish? I gave you an invitation to a wedding."

"And if I was going to that wedding," said Hamish, with a return of that fierce light to the gray eyes, "do you know how I would go to the wedding? I would take two or three of the young lads with me. We would make a fine party for the wedding. Oh yes; a fine party! And if the English church is a fine church, can we not take off our caps as well as any one? But

when the pretty madam came in, I would say to myself, 'Oh yes, my fine madam, you forgot it was a Macleod you had to deal with, and not a child, and you did not think you would have a visit from two or three of the Mull lads?'"

"And what then?" Macleod said, with a smile—though this picture of his sweetheart coming into the church as the bride of another man had paled his cheek.

"And before she had brought that shame on the house of Dare," said Hamish, excitedly, "do you not think that I would seize her—that I would seize her with my own hands? And when the young lads and I had thrust her down into the cabin of the yacht—oh yes, when we had thrust her down and put the hatch over—do you think the proud madam would be quite so proud?"

Macleod laughed a loud laugh.

"Why, Hamish, you want to become a famous person! You would carry off a popular actress, and have all the country ringing with the exploit! And would you have a piper, too, to drown her screams—just as Macdonald of Armadale did when he came with his men to South Uist and carried off Flora Macdonald's mother?"

"And was there ever a better marriage than that—as I have heard many a man of Skye say?" Hamish exclaimed, eagerly. "Oh yes, it is good for a woman to know that a man's will is stronger than a woman's will! And when we have the fine English madam caged up in the cabin, and we are coming away to the north again, she will not have so many fine airs, I think. And if the will can not be broken, it is the neck that can be broken; and better that than that Sir Keith Macleod should have a shame put on him."

"Hamish, Hamish, how will you dare to go into the church at Salen next Sunday?" Macleod said; but he was now regarding the old man with a strange curiosity.

"Men were made before churches were thought of," Hamish said, curtly; and then Macleod laughed, and rode on.

The laugh soon died away from his face. Here was the stone bridge on which she used to lean to drop pebbles into the whirling clear water. Was there not some impression even yet of her soft warm arm on the velvet moss? And what had the voice of the streamlet told him in the days long ago?—that the summer-time was made for happy lovers; that she was coming; that he should take her hand and show her the beautiful islands and the sun-lit seas before the darkening skies of the winter came over them. And here was the summer sea; and moist, warm odors were in the larch-wood; and out there Ulva was shining green, and there was sunlight on the islands and on the rocks of Erisgeir. But she—where was she? Perhaps standing before a mirror, with a dress all of white, and trying how orange blossoms would best lie in her soft brown hair. Her arms are uplifted to her head; she smiles: could not one suddenly seize her now by the waist, and bear her off, with the smile changed to a blanched look of fear? The wild pirates have got her; the Rose Leaf is crushed in the cruel northern hands; at last—at last—what is in the scabbard has been drawn and declared, and she screams in her terror!

Then he fell to brooding again over Hamish's mad scheme. The fine English church of Hamish's imagination was no doubt a little stone building that a handful of sailors could carry at a rush. And of course the yacht must needs be close by; for there was no land in Hamish's mind that was out of sight of the salt-water. And what consideration would this old man have for delicate fancies and studies in moral science? The fine madam had been chosen to be the bride of Macleod of Dare; that was enough. If her will would not bend, it would have to be broken. That was the good old way: was there ever a happier wife than the lady of Armadale, who had been carried screaming down stairs in the night-time, and placed in her lover's boat, with the pipes playing a wild pibroch all the time?

Macleod was in the library that night when Hamish came to him with some papers. And just as the old man was about to leave, Macleod said to him:

"Well, that was a pretty story you told me this morning, Hamish, about the carrying off of the young English lady. And have you thought any more about it?"

"I have thought enough about it," Hamish said, in his native tongue.

"Then perhaps you could tell me, when you start on this fine expedition, how you are going to have the yacht taken to London? The lads of Mull are very clever, Hamish, I know; but do you think that any one of them can steer the *Umpire* all the way from Loch-na-Keal to the river Thames?"

"Is it the river Thames?" said Hamish, with great contempt. "And is that all—the river Thames? Do you know this, Sir Keith, that my cousin Colin Laing, that has a whiskey shop now in Greenock, has been all over the world, and at China, and other places; and he was the mate of many a big vessel; and do you think he could not take the *Umpire* from Loch-na-Keal to London? And I would only have to send a line to him and say, 'Colin, it is Sir Keith Macleod himself that will want you to do this;' and then he will leave twenty or thirty shops—ay, fifty and a hundred shops—and think no more of them at all. Oh yes, it is very true what you say, Sir Keith. There is no one knows better than I the soundings of Loch Scridain and Loch Tua; and you have said yourself

that there is not a bank or a rock about the islands that I do not know; but I have not been to London. No, I have not been to London. But is there any great trouble in getting to London? No, none at all, when we have Colin Laing on board."

Macleod was apparently making a gay joke of the matter; but there was an anxious, intense look in his eyes all the same—even when he was staring absently at the table before him.

"Oh yes, Hamish," he said, laughing in a constrained manner, "that would be a fine story to tell; and you would become very famous—just as if you were working for fame in a theatre; and all the people would be talking about you. And when you got to London, how would you get through the London streets?"

"It is my cousin who would show me the way: has he not been to London more times than I have been to Stornoway?"

"But the streets of London—they would cover all the ground between here and Loch Scridain; and how would you carry the young lady through them?"

"We would carry her," said Hamish, curtly.

"With the bagpipes to drown her screams?"

"I would drown her screams myself," said Hamish, with a sudden savageness; and he added something that Macleod did not hear.

"Do you know that I am a magistrate, Hamish?"

"I know, Sir Keith."

"And when you come to me with this proposal, do you know what I should do?"

"I know what the old Macleods of Dare would have done," said Hamish, proudly, "before they let this shame come on them. And you, Sir Keith—you are a Macleod too; ay, and the bravest lad that ever was born in Castle Dare! And you will not suffer this thing any longer, Sir Keith; for it is a sore heart I have from the morning till the night; and it is only a serving-man that I am; but sometimes when I will see you going about—and nothing now cared for, but a great trouble on your face—oh, then, I say to myself, 'Hamish, you are an old man, and you have not long to live; but before you die you will teach the fine English madam what it is to bring a shame on Sir Keith Macleod!'"

"Ah, well, good-night now, Hamish; I am tired," he said; and the old man slowly left.

He was tired—if one might judge by the haggard cheeks and the heavy eyes; but he did not go to sleep. He did not even go to bed. He spent the livelong night, as he had spent too many lately, in nervously pacing to and fro within this hushed chamber, or seated with his arms on the table, and the aching head resting on the clasped hands. And again those wild visions came to torture him—the product of a sick heart and a bewildered brain; only now there was a new element introduced. This mad project of Hamish's, at which he would have laughed in a saner mood, began to intertwist itself with all these passionate longings and these troubled dreams of what might yet be possible to him on earth; and wherever he turned it was suggested to him; and whatever was the craving and desire of the moment, this, and this only, was the way to reach it. For if one were mad with pain, and determined to crush the white adder that had stung one, what better way than to seize the hateful thing and cage it, so that it should do no more harm among the sons of men? Or if one were mad because of the love of a beautiful white Princess, and she far away, and dressed in bridal robes, what better way than to take her hand, and say, "Quick, quick, to the shore! For the summer seas are waiting for you; and there is a home for the bride far away in the north?" Or if it was only one wild, despairing effort—one last means of trying—to bring her heart back again? Or if there was but the one fierce captured kiss of those lips no longer laughing at all? Men had ventured more for far less reward, surely? And what remained to him in life but this? There was at least the splendid joy of daring and action!

The hours passed; and sometimes he fell into a troubled sleep as he sat with his head bent on his hands—but then it was only to see those beautiful pictures of her that made his heart ache all the more. And sometimes he saw her all in sailor-like white and blue, as she was stepping down from the steamer; and sometimes he saw the merry Duchess coming forward through the ball-room, with her saucy eyes and her laughing and parted lips; and sometimes he saw her before a mirror; and again she smiled—but his heart would fain have cried aloud in its anguish. Then again he would start up, and look at the window. Was he impatient for the day?

The lamp still burned in the hushed chamber. With trembling fingers he took out the letter Ogilvie had written to him, and held the slip of printed paper before his bewildered gaze. "The young and gifted actress." She is "shortly to be married." And the new piece that all the world will come to see, as soon as she is returned from her wedding tour, is "of a tragic nature."

* * * * * *

Hamish, Hamish, do you hear these things? Do you know what they mean? Oh, we will have to look sharp if we are to be there in time! Come along, you brave lads; it is not the first time that a Macleod has carried off a bride. And will she cry, do you think—

for we have no pipes to drown her screams? Ah, but we will manage it another way than that, Hamish! You have no cunning, you old man! There will be no scream when the white adder is seized and caged.

* * * * * *

But surely no white adder! O sweetheart, you gave me a red rose! And do you remember the night in the garden, with the moonlight around us, and the favor you wore next your heart was the badge of the Macleods? You were not afraid of the Macleods then; you had no fear of the rude northern people; you said they would not crush a pale Rose Leaf. And now—now—see! I have rescued you; and those people will persuade you no longer; I have taken you away—you are free! And will you come up on deck now, and look around on the summer sea? And shall we put in to some port, and telegraph that the runaway bride is happy enough; and that they will hear of her next from Castle Dare? Look around, sweetheart: surely you know the old boat. And here is Christina to wait on you; and Hamish—Hamish will curse you no more—he will be your friend now. Oh, you will make the mother's heart glad at last: she has not smiled for many a day.

* * * * * *

Or is it the proud madam that is below, Hamish; and she will not speak; and she sits alone in all her finery? And what are we to do with her now, then—to break her will? Do you think she will speak when she is in the midst of the silence of the northern seas? Or will they be after us, Hamish? Oh, that would be a fine chase, indeed; and we would lead them a fine dance through the western isles; and I think you would try their knowledge of the channels and the banks. And the painter fellow, Hamish, the woman-man, the dabbler—would he be in the boat behind us?—or would he be down below, in bed in the cabin, with a nurse to attend him? Come along, then!—but beware of the overfalls off Tiree, you southern men! Or is it a race for Barra Head, and who will be at Vatersay first? There is good fishing ground on the Sgriobh bhan, Hamish; they may as well stop to fish as seek to catch us among our western isles. See, the dark is coming down, are these the Monach lights in the north?—Hamish, Hamish, we are on the rocks, and there is no one to help her! Oh, sweetheart!—sweetheart!—

The brief fit of struggling sleep is over; he rises and goes to the window; and now, if he is impatient for the new day, behold! the new day is here. Oh, see how the wan light of the morning meets the wan face! It is the face of a man who has been close to Death; it is the face of a man who is desperate. And if, after the terrible battle of the night, with its uncontrollable yearning and its unbearable pain, the fierce and bitter resolve is taken?—if there remains but this one last despairing venture for all that made life worth having? How wildly the drowning man clutches at this or that, so only that he may breathe for yet a moment more! He knows not what miracle may save him; he knows not where there is any land; but only to live—only to breathe for another moment—that is his cry. And then, mayhap, amid the wild whirl of waves, if he were suddenly to catch sight of the shore, and think that he was getting near to that, and see awaiting him there a white Princess, with a smile on her lips and a red rose in her outstretched hand, would he not make one last convulsive effort before the black waters dragged him down?

CHAPTER XLII.

THE WHITE-WINGED DOVE.

THE mere thought of this action, swift, immediate, impetuous, seemed to give relief to the burning brain. He went outside, and walked down to the shore; all the world was asleep; but the day had broken fair and pleasant, and the sea was calm and blue. Was not that a good omen? After all, then, there was still the wild, glad hope that Fionaghal might come and live in her northern home; the summer days had not gone forever; they might still find a red rose for her bosom at Castle Dare.

And then he tried to deceive himself. Was not this a mere lover's stratagem? Was not all fair in love as in war? Surely she would forgive him, for the sake of the great love he bore her, and the happiness he would try to bring her all the rest of her life? And no sailor, he would take care, would lay his rough hand on her gentle arm. That was the folly of Hamish. There was no chance in these days for a band of northern pirates to rush into a church and carry off a screaming bride. There were other ways than that; gentler ways; and the victim of the conspiracy—why, she would only laugh in the happy after-time and be glad that he had succeeded. And meanwhile he rejoiced that so much had to be done. Oh yes, there was plenty to think about now, other than those terrible visions of the night. There was work to do; and the cold sea air was cooling the fevered brain, so that it all seemed pleasant and easy and glad. There was Colin Laing to be summoned from Greenock, and questioned. The yacht had to be provisioned for a long voyage. He had to prepare the mother and Janet for his going away. And might not Norman Ogilvie find out somehow when the marriage was to be, so that

he would know how much time was left him?

But with all this eagerness and haste he kept whispering to himself counsels of caution and prudence. He dared not awaken her suspicion by professing too much forgiveness or friendliness. He wrote to her —with what a trembling hand he put down those words, *Dear Gertrude*, on paper, and how wistfully he regarded them!—but the letter was a proud and cold letter. He said that he had been informed she was about to be married; he wished to ascertain from herself whether that was true. He would not reproach her either with treachery or deceit; if this was true, passionate words would not be of much avail. But he would prefer to be assured, one way or another, by her own hand. That was the substance of the letter.

And then, the answer! He almost feared she would not write. But when Hamish himself brought that pink envelope to him, how his heart beat! And the old man stood there in silence, and with gloom on his face: was there to be, after all, no act of vengeance on her who had betrayed Macleod of Dare?

These few words seemed to have been written with unsteady fingers. He read them again and again. Surely there was no dark mystery within them?

"DEAR KEITH,—*I can not bear to write to you. I do not know how it has all happened. Forgive me, if you can; and forget me. G.*"

"Oh, Hamish," said he, with a strange laugh, "is it an easy thing to forget that you have been alive? That would be an easy thing, if one were to ask you? But is not Colin Laing coming here to-day?"

"Oh yes, Sir Keith," Hamish said, with his eyes lighting up eagerly, "he will be here with the *Pioneer*, and I will send the boat out for him. Oh yes; and you are wanting to see him, Sir Keith?"

"Why, of course," Macleod said. "If we are going away on a long voyage, do we not want a good pilot?"

"And we are going, Sir Keith?" the old man said; and there was a look of proud triumph in the keen face.

"Oh, I do not know yet," Macleod said, impatiently. "But you will tell Christina that if we are going away to the south, we may have lady visitors come on board some day or another; and she would be better than a young lass to look after them, and make them comfortable on board. And if there is any clothes or ribbons she may want from Salen, Donald can go over with the pony; and you will not spare any money, Hamish, for I will give you the money."

"Very well, Sir."

"And you will not send the boat out to the *Pioneer* till I give you a letter; and you will ask the clerk to be so kind as to post it for me to-night at Oban; and he must not forget that."

"Very well, Sir," said Hamish; and he left the room, with a determined look about his lips, but with a glad light in his eyes.

This was the second letter that Macleod wrote; and he had to keep whispering to himself, "Caution! caution!" or he would have broken into some wild appeal to his sweetheart far away:

"DEAR GERTRUDE" (he wrote),—"I gather from your note that it is true you are going to be married. I had heard some time ago; so your letter was no great shock to me; and what I have suffered—well, that can be of no interest to you now, and it will do me no good to recall it. As to your message, I would forgive you freely; but how can I forget? Can you forget? Do you remember the red rose? But that is all over now, I suppose; and I should not wonder if I were, after all, to be able to obey you, and to forget very thoroughly, not that alone, but every thing else. For I have been rather ill of late—more through sleeplessness than any other cause, I think; and they say I must go for a long sea-voyage; and the mother and Janet both say I should be more at home in the old *Umpire* —with Hamish and Christina and my own people round me—than in a steamer; and so I may not hear of you again until you are separated from me forever. But I write now to ask you if you would like your letters returned, and one or two keepsakes, and the photographs: I would not like them to fall into other hands; and sometimes I feel so sick at heart that I doubt whether I shall ever again get back to Dare. There are some flowers, too; but I would ask to be allowed to keep them, if you have no objection—and the sketch of Ulva, that you made on the deck of the *Umpire* when we were coming back from Iona, I would like to keep that, if you have no objection. And I remain your faithful friend,

"KEITH MACLEOD."

Now at the moment he was writing this letter Lady Macleod and her niece were together, the old lady at her spinning-wheel, the younger one sewing. And Janet Macleod was saying:

"Oh, auntie, I am so glad Keith is going away now in the yacht; and you must not be vexed at all or troubled if he stays a long time; for what else can make him well again? Why, you know that he has not been Keith at all of late—he is quite another man—I do not think any one would recognize him. And surely there can be no better cure for sleeplessness than the rough work of the yachting; and you know Keith

will take his share, in despite of Hamish; and if he goes away to the south, they will have watches, and he will take his watch with the others, and his turn at the helm. Oh, you will see the change when he comes back to us!"

The old lady's eyes had slowly filled with tears.

"And do you think it is sleeplessness, Janet," said she, "that is the matter with our Keith? Ah, but you know better than that, Janet."

Janet Macleod's face grew suddenly red; but she said, hastily:

"Why, auntie, have I not heard him walking up and down all the night, whether it was in his own room or in the library? And then he is out before any one is up: oh yes, I know that when you can not sleep the face grows white and the eyes grow tired. And he has not been himself at all—going away like that from every one, and having nothing to say, and going away by himself over the moors. And it was the night before last he came back from Kinloch, and he was wet through, and he only lay down on the bed, as Hamish told me, and would have slept there all the night but for Hamish. And do you not think that was to get sleep at last—that he had been walking so far, and coming through the shallows of Loch Scridain, too? Ah, but you will see the difference, auntie, when he comes back on board the *Umpire;* and we will go down to the shore, and we will be glad to see him that day."

"Oh yes, Janet," the old lady said, and the tears were running down her face; "but you know—you know. And if he had married you, Janet, and staid at home at Dare, there would have been none of all this trouble. And now—what is there now? It is the young English lady that has broken his heart; and he is no longer a son to me, and he is no longer your cousin, Janet, but a broken-hearted man that does not care for any thing. And you are very kind, Janet; and you would not say any harm of any one. But I am his mother—I—I—well, if the woman was to come here this day, do you think I would not speak? It was a bad day for us all that he went away—instead of marrying you, Janet."

"But you know that could never have been, auntie," said the gentle-eyed cousin, though there was some conscious flush of pride in her cheeks. "I could never have married Keith."

"But why, Janet?"

"You have no right to ask me, auntie. But he and I—we did not care for each other—I mean, we never could have been married. I hope you will not speak about that any more, auntie."

"And some day they will take me, too, away from Dare," said the old dame, and the spinning-wheel was left unheeded; "and I can not go into the grave with my five brave lads; for where are they all now, Janet?—in Arizona one, in Africa one, and two in the Crimea, and my brave Hector at Königgrätz. But that is not much: I shall be meeting them all together; and do you not think I shall be glad to see them all together again just as it was in the old days? and they will come to meet me; and they will be glad enough to have the mother with them once again. But, Janet, Janet, how can I go to them? What will I say to them when they ask about Keith—about Keith, my Benjamin, my youngest, my handsome lad?"

The old woman was sobbing bitterly, and Janet went to her and put her arms round her, and said:

"Why, auntie, you must not think of such things. You will send Keith away in low spirits if you have not a bright face and a smile for him when he goes away."

"But you do not know—you do not know," the old woman said, "what Keith has done for me. The others—oh yes, they were brave lads; and very proud of their name, too; and they would not disgrace their name wherever they went; and if they died; that is nothing, for they will be together again now; and what harm is there? But Keith, he was the one that did more than any of them; for he staid at home for my sake; and when other people were talking about this regiment and that regiment, Keith would not tell me what was sore at his heart; and never once did he say, 'Mother, I must go away like the rest,' though it was in his blood to go away. And what have I done now?—and what am I to say to his brothers when they come to ask me? I will say to them, 'Oh yes, he was the handsomest of all my six lads; and he had the proudest heart too; but I kept him at home.' And what came of it all? Would it not be better now that he was lying buried in the jungle of the Gold Coast, or at Königgrätz, or in the Crimea?"

"Oh, surely not, auntie! Keith will come back to us soon; and when you see him well and strong again, and when you hear his laugh about the house, surely you will not be wishing that he was in his grave? Why, what is the matter with you to-day, auntie?"

"The others did not suffer much, Janet; and to three of them anyway it was only—a bullet—a cry—and then the death-sleep of a brave man, and the grave of a Macleod. But Keith, Janet, he is my youngest; he is nearer to my heart than any of them: do you not see his face?"

"Yes, auntie," Janet Macleod said, in a low voice. "But he will get over that. He will come back to us strong and well."

"Oh yes, he will come back to us strong and well!" said the old lady, almost wildly; and she rose, and her face was pale. "But

I think it is a good thing for that woman that my other sons are all away now; for they had quick tempers, those lads; and they would not like to see their brother murdered."

"Murdered, auntie!"

Lady Macleod would have answered in the same wild, passionate way, but at this very moment her son entered. She turned quickly; she almost feared to meet the look of this haggard face. But Keith Macleod said, quite cheerfully:

"Well, now, Janet, and will you go round to-day to look at the *Umpire*? And will you come too, mother? Oh, she is made very smart now; just as if we were all going away to see the Queen."

"I can not go to-day, Keith," said his mother; and she left the room before he had time to notice that she was strangely excited.

"And I think I will go some other day, Keith," his cousin said, gently, "just before you start, that I may be sure you have not forgotten any thing. And, of course, you will take the ladies' cabin, Keith, for yourself; for there is more light in that, and it is farther away from the smell of the cooking in the morning. And how can you be going to-day, Keith, when it is the man from Greenock will be here soon now?"

"Why, I forgot that, Janet," said he, laughing in a nervous way. "I forgot that, though I was talking to Hamish about him only a little while ago. And I think I might as well go out to meet the *Pioneer* myself, if the boat has not left yet. Is there any thing you would like to get from Oban, Janet?"

"No, nothing, thank you, Keith," said she; and then he left; and he was in time to get into the big sailing boat before it went out to meet the steamer.

This cousin of Hamish, who jumped into the boat when Macleod's letter had been handed up to the clerk, was a little black-haired Celt, beady-eyed, nervous, but with the affectation of a sailor's bluffness, and he wore rings in his ears. However, when he was got ashore, and taken into the library, Macleod very speedily found out that the man had some fair skill in navigation, and that he had certainly been into a good number of ports in his lifetime. And if one were taking the *Umpire* into the mouth of the Thames, now? Mr. Laing looked doubtfully at the general chart Macleod had; he said he would rather have a special chart which he could get at Greenock; for there were a great many banks about the mouth of the Thames; and he was not sure that he could remember the channel. And if one wished to go further up the river, to some anchorage in communication by rail with London? Oh yes, there was Erith. And if one would rather have moorings than an anchorage, so that one might slip away without trouble when the tide and wind were favorable? Oh yes, there was nothing simpler than that. There were many yachts about Erith, and surely the pier-master could get the *Umpire* the loan of moorings. All through Castle Dare it was understood that there was no distinct destination marked down for the *Umpire* on this suddenly arranged voyage of hers; but all the same Sir Keith Macleod's inquiries went no further, at present at least, than the river Thames.

There came another letter, in dainty pink; and this time there was less trembling in the handwriting; and there was greater frankness in the wording of the note.

"Dear Keith" (Miss White wrote),—"I would like to have the letters; as for the little trifles you mention, it does not much matter. You have not said that you forgive me; perhaps it is asking too much; but believe me you will find some day it was all for the best. It is better now than later on. I had my fears from the beginning: did not I tell you that I was never sure of myself for a day? and I am sure papa warned me. I can not make you any requital for the great generosity and forbearance you show to me now; but I would like to be allowed to remain your friend. G. W.

"P.S.—I am deeply grieved to hear of your being ill, but hope it is only something quite temporary. You could not have decided better than on taking a long sea-voyage. I hope you will have fine weather."

All this was very pleasant. They had got into the region of correspondence again; and Miss White was then mistress of the situation. His answer to her was less cheerful in tone. It ran thus:

"Dear Gertrude,—To-morrow morning I leave Dare. I have made up your letters, etc., in a packet; but as I would like to see Norman Ogilvie before going farther south, it is possible we may run into the Thames for a day; and so I have taken the packet with me, and, if I see Ogilvie, I will give it to him to put into your hands. And as this may be the last time that I shall ever write to you, I may tell you now there is no one any where more earnestly hopeful than I that you may live a long and happy life, not troubled by any thinking of what is past and irrevocable.

"Yours faithfully,

"Keith Macleod."

So there was an end of correspondence. And now came this beautiful morning, with a fine northwesterly breeze blowing, and the *Umpire*, with her mainsail and jib set, and her gay pennon and ensign fluttering in the

wind, rocking gently down there at her moorings. It was an auspicious morning; of itself it was enough to cheer up a heart-sick man. The white sea-birds were calling; and Ulva was shining green; and the Dutchman's Cap out there was of a pale purple-blue; while away in the south there was a vague silver mist of heat lying all over the Ross of Mull and Iona. And the proud lady of Castle Dare, and Janet, and one or two others more stealthily, were walking down to the pier to see Keith Macleod set sail; but Donald was not there—there was no need for Donald or his pipes on board the yacht. Donald was up at the house,

"Oh, well, Janet," said he, carelessly, "you know that when one goes away on a voyage, it is never certain about your coming back at all; and it is better to leave every thing right."

"But you are not going away from us with thoughts like these in your head, surely?" the cousin said. "Why, the man from Greenock says you could go to America in the *Umpire;* and if you could go to America, there will not be much risk in the calmer seas of the south. And you know, Keith, auntie and I don't want you to trouble about writing letters to us; for you will have enough trouble in looking after the

"AND THIS BEAUTIFUL WHITE-SAILED VESSEL THAT IS GOING SOUTH THROUGH THE SUMMER SEAS."

and looking at the people going down to the quay, and saying bitterly to himself, "It is no more thought of the pipes now that Sir Keith has, ever since the English lady was at Dare; and he thinks I am better at work in looking after the dogs."

Suddenly Macleod stopped, and took out a pencil, and wrote something on a card.

"I was sure I had forgotten something, Janet," said he. "That is the address of Johnny Wickes's mother. We were to send him up to see her some time before Christmas."

"Before Christmas!" Janet exclaimed; and she looked at him in amazement. "But you are coming back before Christmas, Keith?"

yacht; but you will send us a telegram from the various places you put into."

"Oh yes, I will do that," said he, somewhat absently. Even the bustle of departure and the brightness of the morning had failed to put color and life into the haggard face and the hopeless eyes.

That was a sorrowful leave-taking at the shore; and Macleod, standing on the deck of the yacht, could see, long after they had set sail, that his mother and cousin were still on the small quay watching the *Umpire* so long as she was in sight. Then they rounded the Ross of Mull; and he saw no more of the women of Castle Dare.

And this beautiful white-sailed vessel that is going south through the summer seas:

surely she is no deadly instrument of vengeance, but only a messenger of peace? Look, now, how she has passed through the Sound of Iona; and the white sails are shining in the light; and far away before her, instead of the islands with which she is familiar, are other islands—another Colonsay altogether, and Islay, and Jura, and Scarba, all a pale transparent blue. And what will the men on the lonely Dubh Artach rock think of her as they see her pass by? Why, surely that she looks like a beautiful white dove. It is a summer day; the winds are soft; fly south, then, White Dove, and carry to her this message of tenderness, and entreaty, and peace! Surely the gentle ear will listen to you; before the winter comes, and the skies grow dark overhead, and there is no white dove at all, but an angry sea-eagle, with black wings outspread, and talons ready to strike. Oh, what is the sound in the summer air? Is it the singing of the sea-maiden of Colonsay, bewailing still the loss of her lover in other years? We can not stay to listen: the winds are fair. Fly southward, and still southward, O you beautiful White Dove, and it is all a message of love and of peace that you will whisper to her ear!

CHAPTER XLIII.

DOVE OR SEA-EAGLE?

But there are no fine visions troubling the mind of Hamish as he stands here by the tiller in eager consultation with Colin Laing, who has a chart outspread before him on the deck. There is pride in the old man's face. He is proud of the performances of the yacht he has sailed for so many years; and proud of himself for having brought her—always subject to the advice of his cousin from Greenock—in safety through the salt sea to the smooth waters of the great river. And indeed this is a strange scene for the *Umpire* to find around her in the years of her old age. For instead of the giant cliffs of Gribun and Bourg, there is only the thin green line of the Essex coast; and instead of the rushing Atlantic, there is the broad smooth surface of this coffee-colored stream, splashed with blue where the ripples catch the reflected light of the sky. There is no longer the solitude of Ulva and Colonsay, or the moaning of the waves round the lonely shores of Fladda, and Staffa, and the Dutchman; but the eager, busy life of the great river—a black steamer puffing and roaring, russet-sailed barges going smoothly with the tide, a tug bearing a large green-hulled Italian ship through the lapping waters, and every where a swarming fry of small boats of every description. It is a beautiful summer morning, though there is a pale haze lying along the Essex woods. The old *Umpire*, with the salt foam of the sea incrusted on her bows, is making her first appearance in the Thames.

"And where are we going, Hamish," says Colin Laing, in the Gaelic, "when we leave this place?"

"When you are told, then you will know," says Hamish.

"You had enough talk of it last night in the cabin. I thought you were never coming out of the cabin," says the cousin from Greenock.

"And if I have a master, I obey my master without speaking," Hamish answers.

"Well, it is a strange master you have got. Oh, you do not know about these things, Hamish. Do you know what a gentleman who has a yacht would do when he got into Gravesend as we got in last night? Why, he would go ashore, and have his dinner in a hotel, and drink four or five different kinds of wine, and go to the theatre. But your master, Hamish, what does he do? He stays on board, and sends ashore for time-tables and such things; and, what is more than that, he is on deck all night, walking up and down. Oh yes, I heard him walking up and down all night, with the yacht lying at anchor."

"Sir Keith is not well. When a man is not well he does not act in an ordinary way. But you talk of my master," Hamish answered, proudly. "Well, I will tell you about my master, Colin—that he is a better master than any ten thousand masters that ever were born in Greenock, or in London either. I will not allow any man to say any thing against my master."

"I was not saying any thing against your master. He is a wiser man than you, Hamish. For he was saying to me last night, 'Now when I am sending Hamish to such and such places in London, you must go with him, and show him the trains, and cabs, and other things like that.' Oh yes, Hamish, you know how to sail a yacht, but you do not know any thing about towns."

"And who would want to know any thing about towns? Are they not full of people who live by telling lies and cheating each other?"

"And do you say that is how I have been able to buy my house at Greenock," said Colin Laing, angrily, "with a garden and a boat-house too?"

"I do not know about that," said Hamish; and then he called out some order to one of the men. Macleod was at this moment down in the saloon, seated at the table, with a letter inclosed and addressed lying before him. But surely this was not the same man who had been in these still waters of the Thames in the by-gone days, with gay companions around him, and the band playing "A Highland lad my love was

born," and a beautiful-eyed girl, whom he called Rose Leaf, talking to him in the quiet of the summer noon? This man had a look in his eyes like that of an animal that has been hunted to death and is fain to lie down and give itself up to its pursuers in the despair of utter fatigue. He was looking at this letter. The composition of it had cost him only a whole night's agony. And when he sat down and wrote it in the blue-gray dawn, what had he not cast away?

"Oh no," he was saying now to his own conscience, "she will not call it deceiving! She will laugh when it is all over; she will call it a stratagem; she will say that a drowning man will catch at any thing. And this is the last effort—but it is only a stratagem: she herself will absolve me—when she laughs and says, 'Oh, how could you have treated the poor theatres so?'"

A loud rattling overhead startled him.

"We must be at Erith," he said to himself; and then, after a pause of a second, he took the letter in his hand. He passed up the companionway; perhaps it was the sudden glare of the light around that falsely gave to his eyes the appearance of a man who had been drinking hard. But his voice was clear and precise as he said to Hamish,

"Now, Hamish, you understand every thing I have told you?"

"Oh yes, Sir Keith."

"And you will put away that nonsense from your head; and when you see the English lady that you remember, you will be very respectful to her, for she is a very great friend of mine; and if she is not at the theatre, you will go on to the other address, and Colin Laing will go with you in the cab. And if she comes back in the cab, you and Colin will go outside beside the driver, do you understand? And when you go ashore you will take John Cameron with you, and you will ask the pier-master about the moorings."

"Oh yes, Sir Keith; have you not told me before?" Hamish said, almost reproachfully.

"You are sure you got every thing on board last night?"

"There is nothing more that I can think of, Sir Keith."

"Here is the letter, Hamish."

And so he pledged himself to the last desperate venture.

Not long after that Hamish and Laing and John Cameron went in the dingey to the end of Erith pier, and left the boat there; and went along to the head of the pier, and had a talk with the pier-master. Then John Cameron went back, and the other two went on their way to the railway station.

"And I will tell you this, Hamish," said the little black Celt, who swaggered a good deal in his walk, "that when you go in the train you will be greatly frightened. For you do not know how strong the engines are, and how they will carry you through the air."

"That is a foolish thing to say," answered Hamish, also speaking in the Gaelic. "For I have seen many pictures of trains; and do you say that the engines are bigger than the engines of the *Pioneer*, or the *Dunara Castle*, or the *Clansman* that goes to Stornoway? Do not talk such nonsense to me. An engine that runs along the road, that is a small matter; but an engine that can take you up the Sound of Sleat, and across the Minch, and all the way to Stornoway, that is an engine to be talked about!"

But nevertheless it was with some inward trepidation that Hamish approached Erith station; and it was with an awe-struck silence that he saw his cousin take tickets at the office; nor did he speak a word when the train came up, and they entered and sat down in the carriage. Then the train moved off, and Hamish breathed more freely: what was this to be afraid of?

"Did I not tell you you would be frightened?" Colin Laing said.

"I am not frightened at all," Hamish answered, indignantly.

But as the train began to move more quickly, Hamish's hands, that held firmly by the wooden seat on which he was sitting, tightened and still further tightened their grasp, and his teeth got clinched, while there was an anxious look in his eyes. At length, as the train swung into a good pace, his fear got the better of him, and he called out:

"Colin—Colin—she's run away!"

And then Colin Laing laughed aloud, and began to assume great airs, and told Hamish that he was no better than a lad kept for herding the sheep who had never been away from his own home. This familiar air re-assured Hamish; and then the train stopping at Abbey Wood proved to him that the engine was still under control.

"Oh yes, Hamish," continued his travelled cousin, "you will open your eyes when you see London; and you will tell all the people when you go back that you have never seen so great a place; but what is London to the cities and the towns and the palaces that I have seen? Did you ever hear of Valparaiso, Hamish? Oh yes, you will live a long time before you will get to Valparaiso! And Rio: why, I have known mere boys that have been to Rio. And you can sail a yacht very well, Hamish; and I do not grumble that you would be the master of the yacht—though I know the banks and the channels a little better than you; and it was quite right of you to be the master of the yacht; but you have not seen what I have seen. And I have been where there are mountains and mountains of gold—"

"Do you take me for a fool, Colin?" said Hamish, with a contemptuous smile.

"Not quite that," said the other; "but am I not to believe my own eyes?"

"And if there were the great mountains of gold," said Hamish, "why did you not fill your pockets with the gold; and would not that be better than selling whiskey in Greenock?"

"Yes; and that shows what an ignorant man you are, Hamish," said the other, with disdain. "For do you not know that the gold is mixed with quartz, and you have got to take the quartz out? But I dare say now you do not know what quartz is: for it is a very ignorant man you are, although you can sail a yacht. But I do not grumble at all. You are master of your own yacht, just as I am the master of my own shop. But if you were coming into my shop, Hamish, I would say to you, 'Hamish, you are the master here, and I am not the master; and you can take a glass of any thing that you like.' That is what people who have travelled all over the world, and seen princes and great cities and palaces, call *politeness*. But how could you know any thing about *politeness*? You have lived only on the west coast of Mull, and they do not even know how to speak good Gaelic there."

"That is a lie, Colin," said Hamish, with decision. "We have better Gaelic there than any other Gaelic that is spoken."

"Were you ever in Lochaber, Hamish?"

"No, I was never in Lochaber."

"Then do not pretend to give an opinion about the Gaelic—especially to a man who has travelled all over the world, though perhaps he can not sail a yacht as well as you, Hamish."

The two cousins soon became friends again, however. And now, as they were approaching London, a strange thing became visible. The blue sky became more and more obscured. The whole world seemed to be enveloped in a clear brown haze of smoke.

"Ay, ay," said Hamish, "that is a strange thing."

"What is a strange thing, Hamish?"

"I was reading about it in a book many a time—the great fire that was burning in London for years and years and years: and have they not quite got it out yet, Colin?"

"I do not know what you are talking about, Hamish," said the other, who had not much book-learning, "but I will tell you this, that you may prepare yourself now to open your eyes. Oh yes, London will make you open your eyes wide, though it is nothing to one who has been to Rio, and Shanghai, and Rotterdam, and other places like that."

Now these references to foreign parts only stung Hamish's pride; and when they did arrive at London Bridge he was determined to show no surprise whatever. He stepped into the four-wheeled cab that Colin Laing chartered just as if four-wheeled cabs were as common as sea-gulls on the shores of Loch-na-Keal. And though his eyes were bewildered and his ears dinned with the wonderful sights and sounds of this great roaring city—that seemed to have the population of all the world pouring through its streets—he would say nothing at all. At last the cab stopped; the two men were opposite the Piccadilly Theatre.

Then Hamish got out and left his cousin with the cab. He ascended the wide steps; he entered the great vestibule; and he had a letter in his hand. The old man had not trembled so much since he was a schoolboy.

"What do you want, my man?" some one said, coming out of the box office by chance.

Hamish showed the letter.

"I wass to hef an answer, Sir, if you please, Sir, and I will be opliged," said Hamish, who had been enjoined to be very courteous.

"Take it round to the stage entrance," said the man, carelessly.

"Yes, Sir, if you please, Sir," said Hamish; but he did not understand; and he stood.

The man looked at him; called for some one; a young lad came; and to him was given the letter.

"You may wait here, then," said he to Hamish; "but I think rehearsal is over, and Miss White has most likely gone home."

The man went into the box office again; Hamish was left alone there in the great empty vestibule. The Piccadilly Theatre had seldom seen within its walls a more picturesque figure than this old Highlandman, who stood there with his sailor's cap in his hand, and with a keen excitement in the proud and fine face. There was a watchfulness in the gray eyes like the watchfulness of an eagle. If he twisted his cap rather nervously, and if his heart beat quick, it was not from fear.

Now when the letter was brought to Miss White, she was standing in one of the wings, laughing and chatting with the stage-manager. The laugh went from her face. She grew quite pale.

"Oh, Mr. Cartwright," said she, "do you think I could go down to Erith and be back before six in the evening?"

"Oh yes; why not?" said he, carelessly.

But she scarcely heard him. She was still staring at that sheet of paper, with its piteous cry of the sick man. Only to see her once more—to shake hands in token of forgiveness—to say good-by for the last time: what woman with the heart of a woman could resist this despairing prayer?

"Where is the man who brought this letter?" said she.

"In front, miss," said the young lad, "by the box office."

Very quickly she made her way along the gloomy and empty corridors, and there in the twilit hall she found the gray-haired old sailor, with his cap held humbly in his hands.

"Oh, Hamish," said she, "is Sir Keith so very ill?"

"Iss it ill, mem?" said Hamish; and quick tears sprang to the old man's eyes. "He iss more ill than you can think of, mem; it iss another man that he iss now. Ay, ay, who would know him to be Sir Keith Macleod?"

"He wants me to go and see him—and I suppose I have no time to go home first—"

"Here is the list of the trains, mem," said Hamish, eagerly, producing a certain card. "And it iss me and Colin Laing, that'ss my cousin, mem; and we hef a cab outside; and will you go to the station? Oh, you will not know Sir Keith, mem; there iss no one at all would know my master now."

"Come along, then, Hamish," said she, quickly. "Oh, but he can not be so ill as that. And the long sea-voyage will pull him round, don't you think?"

"Ay, ay, mem," said Hamish; but he was paying little heed. He called up the cab; and Miss White stepped inside; and he and Colin Laing got on the box.

"Tell him to go quickly," she said to Hamish, "for I must have something instead of luncheon if we have a minute at the station."

And Miss White, as the cab rolled away, felt pleased with herself. It was a brave act.

"It is the least I can do for the sake of my bonnie Glenogie," she was saying to herself, quite cheerfully. "And if Mr. Lemuel were to hear of it? Well, he must know that I mean to be mistress of my own conduct. And so the poor Glenogie is really ill. I can do no harm in parting good friends with him. Some men would have made a fuss."

At the station they had ten minutes to wait; and Miss White was able to get the slight refreshment she desired. And although Hamish would fain have kept out of her way—for it was not becoming in a rude sailor to be seen speaking to so fine a lady—she would not allow that.

"And where are you going, Hamish, when you leave the Thames?" she asked, smoothing the fingers of the glove she had just put on again.

"I do not know that, mem," said he.

"I hope Sir Keith won't go to Torquay or any of those languid places. You will go to the Mediterranean, I suppose?"

"Maybe that will be the place, mem," said Hamish.

"Or the Isle of Wight, perhaps," said she, carelessly.

"Ay, ay, mem—the Isle of Wight; that will be a ferry good place, now. There wass a man I wass seeing once in Tobermory, and he wass telling me about the castle that the Queen herself will hef on that island. And Mr. Ross, the Queen's piper, he will be living there too."

But of course they had to part company when the train came up; and Hamish and Colin Laing got into a third-class carriage together. The cousin from Greenock had been hanging rather in the background; but he had kept his ears open.

"Now, Hamish," said he, in the tongue in which they could both speak freely enough, "I will tell you something; and do not think I am an ignorant man; for I know what is going on. Oh yes. And it is a great danger you are running into."

"What do you mean, Colin?" said Hamish; but he would look out of the window.

"When a gentleman goes away in a yacht, does he take an old woman like Christina with him? Oh no; I think not. It is not a customary thing. And the ladies' cabin; the ladies' cabin is kept very smart, Hamish. And I think I know who is to have the ladies' cabin."

"Then you are very clever, Colin," said Hamish, contemptuously. "But it is too clever you are. You think it strange that the young English lady should take that cabin. I will tell you this—that it is not the first time nor the second time that the young English lady has gone for a voyage in the *Umpire*, and in that very cabin too. And I will tell you this, Colin; that it is this very year she had that cabin; and was in Loch Tua, and Loch-na-Keal, and Loch Scridain, and Calgary Bay. And as for Christina—oh, it is much you know about fine ladies in Greenock! I tell you that an English lady can not go any where without some one to attend to her."

"Hamish, do not try to make a fool of me," said Laing, angrily. "Do you think a lady would go travelling without any luggage? And she does not know where the *Umpire* is going!"

"Do you know?"

"No."

"Very well, then. It is Sir Keith Macleod who is the master when he is on board the *Umpire*, and where he wants to go, the others have to go."

"Oh, do you think that? And do you speak like that to a man who can pay eighty-five pounds a year of rent?"

"No, I do not forget that it is a kindness to me that you are doing, Colin, and to Sir Keith Macleod too; and he will not forget it. But as for this young lady or that young lady, what has that to do with

it? You know what the bell of Scoon said: '*That which concerns you not, meddle not with.*'"

"I shall be glad when I am back in Greenock," said Colin Laing, moodily.

But was not this a fine, fair scene that Miss Gertrude White saw around her when they came in sight of the river and Erith pier?—the flashes of blue on the water, the white-sailed yachts, the russet-sailed barges, and the sunlight shining all along the thin line of the Essex shore. The moment she set foot on the pier she recognized the *Umpire* lying out there, the great white mainsail and jib idly flapping in the summer breeze: but there was no one on deck. And she was not afraid at all; for had he not written in so kindly a fashion to her; and was she not doing much for his sake, too?

"Will the shock be great?" she was thinking to herself. "I hope my bonnie Glenogie is not so ill as that; for he always looked like a man. And it is so much better that we should part good friends."

She turned to Hamish.

"There is no one on the deck of the yacht, Hamish," said she.

"No, mem," said he, "the men will be at the end of the pier, mem, in the boat, if you please, mem."

"Then you took it for granted I should come back with you?" said she, with a pleasant smile.

"I wass thinking you would come to see Sir Keith, mem," said Hamish, gravely. His manner was very respectful to the fine English lady: but there was not much of friendliness in his look.

She followed Hamish down the rude wooden steps at the end of the pier; and there they found the dingey awaiting them, with two men in her. Hamish was very careful of Miss White's dress as she got into the stern of the boat; then he and Colin Laing got into the bow; and the men half paddled and half floated her along to the *Umpire*—the tide having begun to ebb.

And it was with much ceremony, too, that Hamish assisted Miss White to get on board by the little gangway; and for a second or two she stood on deck and looked around her, while the men were securing the dingey. The idlers lounging on Erith pier must have considered that this was an additional feature of interest in the summer picture—the figure of this pretty young lady standing there on the white decks and looking around her with a pleased curiosity. It was some little time since she had been on board the *Umpire*.

Then Hamish turned to her, and said, in the same respectful way:

"Will you go below, mem, now? It iss in the saloon that you will find Sir Keith, and if Christina iss in the way, you will tell her to go away, mem."

The small gloved hand was laid on the top of the companion, and Miss White carefully went down the wooden steps. And it was with a gentleness equal to her own that Hamish shut the little doors after her.

But no sooner had she quite disappeared than the old man's manner swiftly changed. He caught hold of the companion hatch; jammed it across with a noise that was heard throughout the whole vessel; and then he sprang to the helm, with the keen gray eyes afire with a wild excitement.

"—— her, we have her now!" he said, between his teeth; and he called aloud: "Hold the jib to weather there! Off with the moorings, John Cameron! —— her, we have her now!—and it is not yet that she has put a shame on Macleod of Dare!"

SOME PECULIARITIES OF YELLOW JACK.

"FROM time to time yellow fever knocks at our doors," says a close observer and student of the disease, "and if they were not kept carefully closed, no one could answer for the consequences." For two centuries and more it has knocked at the gates of our sea-port towns all the way from the Gulf of Mexico to Boston, and as far beyond as Quebec; and it has broken in, until comparatively recent times, quite as frequently and fatally upon the North as upon the South. In the city of Philadelphia, for instance, it has been especially destructive; more than once it has caused a mortality there that is comparable to that of the true Asiatic (or "glandular") plague. "Few cities beyond the tropics," say Dr. La Roche, the leading authority among hundreds of writers upon the subject, "New Orleans, Charleston, and one or two others excepted, have been as repeatedly visited by the fever as Philadelphia was prior to 1820. In few has it spread more extensively than it did during some of our epidemics, and certainly in none within the limits of this country has it assumed a more malignant garb, and given rise to a greater ratio of mortality among those attacked. Nay, it may be doubted whether the records of West Indian or European epidemics exhibit more than a few instances in which the disease has proved more extensively destructive to human life."

Whence has come this terrible plague unknown to the ancients—the plague of the New World? The question, like others that may be asked about it, is easier asked than answered. Where the disease was first observed is not known. The best authorities think that it originated in the West India Islands soon after the immigration of Europeans. It was nowhere known before the beginning of the sixteenth century. Columbus and his companions left

descriptions of a disease which they saw in the Antilles, and which, according to some modern writers, must have been the yellow fever. But the accounts left by these sturdy explorers are not quite scientific enough to make us feel sure as to just what they observed in the domain of pathology. Whether it was yellow fever or something else, the Antilles were, in all likelihood, the cradle of the disease. Spreading thence, it has domiciled itself since the time of Columbus in Southern Europe; and almost yearly it sets out from its habitats in the Gulf of Mexico and travels northward, "without haste, without rest," for hundreds or thousands of miles, until its epidemic force is spent or checked.

Owing probably to the greater commerce of Northern than of Southern sea-ports with the infected regions, the former were the earlier sufferers. The first definite record that I find of the disease as an epidemic upon our territory is that of its ravages in Boston in the year 1681. It reached New York in 1702, Philadelphia thirty years later, New Haven in 1743, and Norfolk in 1747. In New Orleans the disease was unknown until 1796—more than a hundred years after it had found its way to Boston! Some of the Southern towns formed an early acquaintance with it, as Mobile in 1705. But in New Orleans the yellow fever has more than made up for the tardiness of its first appearance, having prevailed there as an epidemic about forty times during the past eighty years. In Boston there were six epidemics between 1681 and 1695; in Philadelphia during the eighteenth century there were eleven, those of 1793 and of 1797 being especially fatal. In the latter year from three-fourths to five-sixths of the city population fled into the country. Two out of every five cases died—nearly one-half of those who were attacked. This degree of mortality is seldom exceeded in any epidemics except those of the Asiatic plague, in which often nearly all who are attacked may perish, and which has more than once swept away a full half of the population of a given community. The plague is the most fatal of all epidemic diseases; but happily it is much less prevalent in modern times than formerly.

The yellow fever record of the present century begins with the epidemic of Philadelphia in 1802. In one or many parts of the United States the disease has prevailed almost yearly since that time, up to the dreadful summer just ended in the South. But it would fill pages of this Magazine simply to mention our past visitations of the pestilence even in the North. Let us turn from the historic record to the description, the natural history, of the disease, and ask what its origins are to-day, whence it comes, whither it goes, and what are some of the mysterious ways of its moving. The physician can not give full answers to all of these questions; but some of the answers are very curious, and not a few of them may be new to my readers who have not chanced to see or to study the disease. I will try to set forth in short compass the substance of what is known respecting this gravest epidemic of the Western Continent.

Yellow fever, like the cholera, is one of the great migrating diseases. Starting from some point within the tropics, it travels steadily onward from point to point as long as it does not meet freezing weather; and it travels northward by preference—comparatively seldom to the southward of the zone from which it sets out. Thus Brazil has suffered comparatively little from its epidemic visitations, though, as we shall see, the disease planted its germs long ago in Rio de Janeiro, on the extreme southern limit of the tropics. But its favorite course is toward the north. "Upon our Atlantic coasts," says Dr. J. C. Nott, a careful student and observer of its phenomena, "as on the coast of the Mediterranean, it comes from time to time in one of those immense waves that know no bounds and stop at no impediments. The distance to which the disease extends seems to depend much upon the strength of the wave: it first strikes the Gulf, and *generally* goes no farther. Occasionally it will break over the peninsula of Florida and reach Savannah and Charleston. In 1855, after many years of immunity, it struck Norfolk with full force, and only a few ripples, as in 1853, 1856, 1870, have for half a century reached the Delaware River and the bay of New York." And the same observer, writing eight years ago, adds some words which have a grave significance to-day: "Yellow fever, after a long absence, never makes its re-appearance in our Northern cities without a warning from the Gulf of Mexico. It is seen not only for months, but often for several years, in vigorous action in its native habitat before it leaps over its accustomed bounds; but when once on the tramp, it may travel from Buenos Ayres to Quebec, leaving more graves in its track than Asiatic cholera. There is reason to fear that one of these eruptions is now marshalling its forces."

Let us glance at the course of one of these typical epidemics—at the one, for instance, which started as far away as Rio de Janeiro, twenty-eight years ago, and travelled in six years all the way to New York—a journey of nearly four thousand miles—in a great circle. A great many years before, so many that the inhabitants of Rio had lost all recollection or tradition of the fact, the yellow fever had visited their city; but now the epidemic broke upon them like lightning from a clear sky. "This outbreak," says Dr. Nott, "commenced in Rio

in January, 1850, and travelled night and day for six years, making its expiring effort in New York Bay in 1856. I had my eye upon this epidemic from its commencement, watching its steady course and ravages along the Atlantic, Caribbean Sea, and Gulf of Mexico for several thousand miles. When it struck New Orleans [1853] it was clear to my mind that our own coast was doomed, and before it reached Mobile I was so certain it would come that I moved my family into the healthy pine hills, seven miles from the town, where the disease had never been. But, in spite of all my prudence, the disease not only came to Mobile, but followed my family out to Spring Hill, where I lost four of my children in one week."

How is the disease disseminated? In two ways: in a given town or city, by a slow and regular progression from house to house; between distant places, by following the lines of travel and commerce. It is carried with especial frequency by sailing ships, and generally makes its first appearance in a previously healthy place near the docks and wharves. Whether the part of the town nearest the water happens to be a clean or a dirty quarter, a rich or a poor one, makes no difference. Clean streets do not check the disease, nor does foulness favor its spreading. In 1857 the yellow fever prevailed in that part of New Orleans which was, by official report, "in the best possible sanitary condition," and in no other, though the rest of the city was and had been for years almost indescribably filthy. The germs of the disease are portable, like bulk in freight, and they will take root in any soil. They lurk in baggage-cars, in boxes, and in clothing, in any loose-textured substance that is closely shut up, as even in cargoes of sugar. In porous materials like these—*fomites*, as physicians call them—the poison will hide and ripen for some two months' time, and develop its fullest strength of infection. A parcel sent from New Orleans may start an epidemic of yellow fever in Boston or Quebec.

The disease is one of hot climates, and of low alluvial ground by preference, though any kind of soil will do for it, and any elevation above sea-level that is not too great for the degree of heat required. That degree is a daily average, continued for some weeks together, of from 77° to 80° F.—a temperature which is reached for a month or more together and exceeded, during our more than torrid summers, in almost any of our towns and cities from Florida to Maine. Yellow fever has prevailed as far north even as Quebec, and may extend as far again in the future.

Of the mysterious way in which the disease travels from house to house, a living messenger of death, we know little. Science has not yet been able to seize upon the secret of its cause, which in all cases is probably the same, though some observers think that there are two distinct forms of the disease. Is it in a microscopic plant or insect, too small, however, for detection by the highest magnifying power yet at our command, that its exciting cause consists? That is probable. It is supposed that these germs enter the blood and destroy it by a process comparable to that which is set up in yeast by fermentation. It has been suggested, very plausibly, that this living germ can enter the human body only at a particular stage of its own growth, and that when it has completed its career by multiplying there, it has no power to leave that body and invade the sanctuary of another life. This theory would account for the non-contagiousness of the disease.

As heat fosters, so cold suppresses, the disease. A mere touch of frost, however, is not enough to destroy it; there must be cold enough to make ice. "In New York and the vicinity the fever poison has generally remained active until the last days of October, and frequently as late as the middle or last of November," according to recent reports of the New York Board of Health. Even the winter, while it checks, by no means always extirpates, the poison. It lies latent during the winter, and when warm weather comes again the disease completes its work, taking it up at the point where it had left off during the previous year. "Not only does yellow fever *hibernate* during its migrations," says Dr. Nott, "but it will half do its work during one autumn in cities, resume and finish it the next season: 1842–43 was an example of this in Mobile; 1843–44 in Montgomery, Alabama; 1857–58 in New Orleans. Many similar examples might be adduced." In the former instance, adds Dr. Nott, the yellow fever "commenced in Spanish Alley, in the southern part of the city, and took six weeks to overrun one-half of the town, or all that part south of Dauphin Street, which divides the town into two pretty nearly equal parts. The next year the disease commenced in the northern extreme, and swept all the town left untouched the previous year. Each year it took its half of the town more deliberately than the army-worm would eat through a cotton field.....As remarked by Dr. Warren Stone, of New Orleans, it will often travel, like a tax-collector, from house to house along a street for two or three weeks before it diverges." So constant is this gradual progression that when the disease is prevailing in one part of a town the resident of another part can retire with safety long after the first appearance of the epidemic. In New York, during the epidemic of 1822, its measured progress was about forty feet per day. The Board of Health

put a fence around it in Rector Street, "and extended the inclosure every few days, to keep persons out of the infected district."

Is yellow fever contagious? No question in medicine, and scarcely any in theology, has been debated more learnedly and more ardently—I may say, indeed, more furiously—nor for a longer time, than this one. In Spain, at one time, the discussion grew so violent that it had to be prohibited by law. It is said—or at least it is said that it is said—by a grave historian of the game of chess, that during the early Middle Ages, when the chess-board was a large table, and the chess-men were as big as nine-pins, quarrels would sometimes arise toward the end of the game; when, to settle the point in discussion, the rival players would snatch the kings or queens from the board and brain each other with them. So many fine players, it seems, were lost to science in this way that finally the expedient was hit upon of reducing the size of the chess-men to their present harmless proportions. Well, the quarrel over the contagiousness of yellow fever has fallen off in interest to quite an equal degree. It is now generally admitted that yellow fever is not contagious; that is to say, a person who has the disease can not directly communicate it to any body else. The poison, as we have seen, has its own sufficient ways of spreading and multiplying independently of the human body. It is not from man to man that it hands on the inverted torch. Consequently the well, as long as they live in a place which the epidemic infection has not reached, are perfectly safe. They need not fear the presence or even the contact of yellow fever patients that may come to them from an infected region, if they attend to the disinfection of clothes and baggage. You may receive the sick from an infected ship, or have the dying patients from a yellow fever hospital quartered upon you, and yet, so long as the disease has not come to your neighborhood in one of the ways I have mentioned, you are safe. But leave your uninfected house and visit the infected ship or city, and you will catch the disease, unless, of course, you are exempt from danger by reason of a previous attack, or for some other of the reasons to be mentioned. A few minutes, even, spent upon a ship where the disease exists has cost many a man his life. But it is the ship, and not the sufferer on board, that gives out the poison. In a city it travels the fastest, and is the most fatal near the ground. Persons living in the upper stories of buildings sometimes pass through the worst epidemics safely, while the lower floors are full of the sick and dying.

The experiments which have been made by courageous physicians to prove that the yellow fever can not be taken directly from the human body are too sickening for description here.* It is enough to say that both experiment and long experience indicate that the yellow fever is not communicated from one human body to another. It can only be taken from infected *things* and from infected *places*. And when its germs have once been planted in a given place, they remain latent there for more than a single season. Following years see a renewal, usually in milder form, of the epidemic; until finally, in a Northern climate, the disease spends itself, and does not return until it is borne northward again upon one of the great epidemic waves from the Gulf of Mexico.

Against the epidemic onslaught of such a disease as this it will be seen that the mere quarantine of persons can be of little use, for the poison not only travels in its own dark way, but develops its strength in the porous substances which carry it. Against this latter source of danger nothing but thorough disinfection will serve—the subjection, namely, of every infected vessel or package coming from the yellow fever zone either to a degree of cold below 32° F. or of heat not less than 200°, either of which temperatures will disinfect effectually. To check the spread of the epidemic from house to house, when once it has found a foot-hold, no effective means have yet been devised, though many have been suggested. A newspaper correspondent proposed lately to explode gunpowder in the streets of Southern cities and in the bedrooms of the sick, hoping to destroy the poison germs by concussion. Of course the plan is a futile one; the microscopic germ would no more feel the shock of such an air wave than the hull of an Atlantic steamer would feel the shock of a rising tide. If I were to make a suggestion, it would be to inclose the infected district, at the beginning of the epidemic, with a constantly burning fire. Should the disease overleap this *cordon* it might be necessary to burn the infected houses to the ground. As much as this is often done to check the much less dreadful calamity of a conflagration.

But let me not paint the disease in darker colors than it deserves. Even in the worst epidemics many are exempt, and generally a majority of those affected recover. One attack almost always exempts from a second, as in the case of small-pox and other zymotic or *ferment* diseases. The *preferences* of the yellow fever, as to attack and exemption, are very interesting, at least to those who live within its range. Thus it is especially a disease of mature years. Children and old people comparatively seldom take it, though they are by no means always ex-

* See, for instance, in *La Roche on Yellow Fever*, vol. i., p. 295, the account of Fürth's inoculations.

empt. The majority of cases in this country occur in persons between the ages of fourteen and forty. Stout and healthy people, well nourished and of the sanguine temperament, are the most likely to take it and to die of it. Thin, wiry, nervous persons escape it more frequently, and make more frequent recoveries. Women are less likely to take it, and have better chances of recovery, than men. Race and acclimation make a great difference in one's chances. After living long in the yellow fever zone one may become acclimatized, and pass safely through repeated epidemics of the disease. If then such a person goes North to live, he will at once begin to lose his acclimation, and if he stays long enough, he may lose it entirely, and die of the yellow fever on returning to the South. The risk in such a case is greater in proportion to the time one has been absent; even more than this, the risk is the greater in proportion to the northward remoteness of the place that one has gone to live in. Let an acclimated resident of New Orleans, for instance, go to Charleston to live; he will at once begin to lose his immunity from the fever, but he will not lose it rapidly. But let him go farther north, as to Portland or Quebec; he will then lose his Southern acclimation much more speedily and certainly. A few years of Northern residence might make it a fatal thing for him to be exposed again to a Southern epidemic. But he could never certainly know whether he had lost his acclimation except by running the risks of a new exposure.

The duration of the yellow fever in a given case is very variable, but it is generally from three to nine days; in fatal cases the average duration is about five days. Still more variable is the time from the exposure to the appearance of the first symptoms—the so-called period of incubation; it may be a day, it may be a fortnight, or more. The dreaded symptom of black-vomit is almost surely a fatal one: after this occurs, not more than two or three out of a hundred recover.

It remains to note some of the more general effects of the yellow fever infection. During an epidemic those who do not take the disease still feel the epidemic influence, and are very commonly more or less indisposed. Like persons living in a miasmatic region, those who are exposed to the yellow fever poison will sleep poorly at night. Commonly such a person's "appetite will not be so good as formerly; his system will be attacked from time to time by the offshoots of the diseases preying on others around him." During the epidemic of Natchez in 1819, and in 1820 at New Orleans, a general depression of health was remarked; and even the vegetable kingdom, like the human, seems "subjected in some degree to the effect of the unseen agent;" and the vegetable kingdom is not yet supposed, even by the most advanced disciples of Darwin, to be greatly affected by the power of the imagination. Cautious observers have long ago remarked the coincidence of blights with pestilences. The potato-disease keeps company with influenza and cholera. It is certain that unusually sickly seasons "are often alike unfavorable to the health and fruitfulness of many classes of plants." During the Louisiana epidemic of 1853, Mr. Lawrence, a New Orleans gardener, found that "his garden seeds would often fail to germinate. But still oftener, when they would sprout up a few inches from the soil, a sudden blight would seize them, and in a few days they would wither and die. This was eminently the case with the cauliflower, the celery, the cabbage, radish, and other vegetables. To keep up his stock he in vain applied to his neighbors, to those on the opposite side of the river and down the coast. These effects only continued during the epidemic. At Biloxi the peaches rotted on the trees; at Bayou Sara the China-trees had a sickly appearance, and their leaves were covered with a crustaceous larva; at Baton Rouge the peaches were full of worms, and potatoes rotted in the ground;" and at Lake Providence the figs were few and poor.

"Still more striking," continues La Roche, "is the effect of the insalubrious condition on animals, both domestic and wild, previous to and during the course of the disease. Dogs, cats, hogs, goats, monkeys, cattle of all kinds, foxes and panthers, fowls, parrots, undomesticated birds, and even fish and oysters, are known to participate at times in the calamity." Just before the epidemic of 1797 four or five thousand cats died in Philadelphia, and dogs "were severely and fatally affected the same year and about the same time. The next year cats were again affected, as well as rats, of both of which numbers were carried off"—an unusual case of adjustment between the demand and the supply in the economy of the lower animals.

Such are the main characteristics of the yellow fever as seen in America and in Europe, where the type of the disease is substantially the same as here. With the appalling symptoms and the too often unsuccessful treatment of this terrible disease we have had happily little to do in Northern latitudes for several years, and that part of the subject need not be discussed in these pages. Let us hope that before the next plague wave rolls northward upon us from the Gulf of Mexico, some great discoverer—the Jenner of yellow fever—will tell us how to break its fatal force as thoroughly as the force of the small-pox was broken by the discovery of vaccination.

THE FIRST RAILROAD IN CHINA.

I REMEMBER seeing, many years ago, a remarkable book, published in Vermont, the title of which might have served well as a heading for this paper, recording faithfully, as it proposes to do, the details and ignominious ending of an earnest effort to advance Western civilization in the Far East. This title was, *Apokatastasis; or, Progress Backward.*

The Shanghai-bound mail-steamer, having threaded the tortuous passages of the Chusan Archipelago, rounded Gutzlaff Island, and steamed some fifty miles up the broad and muddy Yangtsze, turns at the "Red Buoy," and enters the narrower Wongpoo, soon reaching the town of Woosung, at the mouth of the creek of the same name. What Woosung is like it is unnecessary to say; what it is hopelessly *unlike* may be learned by consulting a highly imaginative picture in the late Mr. Seward's *Travels*, representing non-existent pagodas and impossible mountains. From hence to the foreign settlement at Shanghai is, by the curving river, some twelve miles, but as the crow flies, about eight. Over this shorter distance some public-spirited people constructed, about twelve years ago, a carriage road, expecting to give their fellow-residents a new and pleasant drive and the enjoyment of a cool breeze on sultry summer afternoons. It was, however, never very popular, and the lower and larger portion was perforce abandoned when the Chinamen had stolen the bridges piecemeal, and were gradually and skillfully merging the road itself in the adjoining rice fields. The upper portion, however, remained in use, especially as, a short distance from Shanghai, it passed the rifle range, occupied periodically by volunteers and naval brigades, generally to their own satisfaction, but occasionally to the detriment of the ingenuous natives, who insisted on choosing it for a promenade. It happened that on a crisp and pleasant Saturday, about five years ago, the weekly paper hunt was announced to "finish" at this place. This paper hunt is an approved winter sensation in Shanghai, the foxes being red-coated horsemen, who, scattering paper at full gallop over a previously selected course, furnish scent to a large and well-appointed field of hunters. A difficult jump has always to be taken at the "finish," at which are present numbers of ladies and gentlemen. On this occasion a commotion was visible among the spectators, evidently not attributable to the prowess and mishaps of the riders, and its cause was found in the curious spectacle of two long white lines, or lime marks, thirty feet apart, clearly the work of an engineer, and stretching over the paddy fields in the direction of Woosung. This was the brief and informal announcement of the birth of an undertaking, the funeral obsequies of which were equally briefly and informally chronicled in a cable dispatch recently published in the New York papers, and reading, "The Chinese are pulling up the Woosung Railway."

The foreign merchants in China are a hard-working and enterprising set of men, who have always been considered good fellows (if I except a brief cycle of unpopularity when the English and American papers called them "irate traders" and "envenomed old smugglers)." I doubt, at all events, if, in any part of the world, men are more alert to see and seize upon any new business opening; and it is not to be supposed that through the long years which had elapsed since the establishment of the Treaty Ports they had not done all that in them lay to introduce railroads into a country so singularly fitted to benefit by them. In this effort, however, they had been thwarted at every turn. Never had it seemed possible to obtain any thing remotely approaching authority or concession. It remained for the representatives of the more active commercial nations to take a valuable hint from a few subjects of a small and gallant Continental kingdom. The Great Northern Telegraph Company, of Denmark, had secured the right to use the Russian land lines reaching through Siberia to Wladivostok, a port just northeast of Corea. They proposed to lay a submarine cable thence, *viâ* Nagasaki, to Shanghai, and from Shanghai to Hong-Kong. It seemed needful to obtain permission to bring the wires ashore at Shanghai, and the commissioner went to Pekin for this purpose. He met with a refusal, curt and decisive. This outrageous request was like a bomb-shell in the Tsung-li Yamun (Foreign Office). The very hairs in Prince Kung's venerable pigtail stood on end. The impudence of these barbarians was astounding. Did they not know that the short line, constructed some years before from Shanghai to the Beacon, had so offended the mighty Fung-Shuey, or Spirit of the Air, that deaths in the neighborhood had been incessant, until the villagers very properly destroyed this obnoxious invention? Let the presumptuous commissioner retire. "A necessary communication. Respect this." By all rights this commissioner should have considered himself snubbed, crushed, and should have sent a protest to his minister, inspired some indignant articles in the newspapers, and gone home. But so regardless of precedent ("olo-custom," the Chinamen call it) were he and his associates that they held their peace, ordered up their telegraph steamer, laid their cable, brought the end into Shanghai, and opened their office; and in about three

weeks, if I mistake not, the Chinese officials were sending messages over the wires themselves! When this had all come to pass, certain Englishmen and Americans felt very small indeed. It was clear that the yellow-haired barbarians had beaten the red-haired ones (the writer has known a native to address an envelope to an H.B.M. representative as "Red-haired Barbarian Consul)," and the latter sadly reflected that they had undoubtedly lived in vain if, after all these years of toil and trouble, it had needed these countrymen of Hamlet to remind them that since, as every school-boy ought to know, all things in China are reversed, they should of course have understood that the mandarins wanted them to act first and ask permission afterward!

With this view of the case strongly impressed on their minds, a party of gentlemen found it agreeable about this time to take their twelve-o'clock breakfast together, at intervals of a few days, and chat about the old road to Woosung. Some of them took a walk, others a ride, over it, and inquiries were carefully pushed in various quarters. It was soon evident that if a railroad could be built in China, it must be over this track; and even the accomplishment of this seemed by no means certain. Toward the acquiring, therefore, of a clear title to this road all efforts were directed.

It must now be explained that foreigners hold land in China by treaty stipulations, under title deeds, in both Chinese and English, registered at a consulate: usually, but by no means necessarily, that of the nation to which the owner belongs. This title is in the nature of a perpetual lease. Could such title be obtained for a strip of land embracing the old road, it seemed reasonable to assume that if there were interference with any construction thereupon, the tenure of every hong and other piece of real estate in Shanghai would be affected, and the railroad projectors would have the whole community at their back. Purchases were therefore cautiously begun and carried on, and registry obtained, not in the British or United States consulate, where attention would be attracted to it, but in a Continental bureau. Of course there were numerous and troublesome obstacles, such as are not unknown in Western lands. Farmers claimed many times the value of their holdings for small corners; old women of horrible aspect, and mistresses of the choicest Chinese billingsgate, cursed the engineer and interpreter by their gods, and vowed that Confucius himself should not have an iota of their patrimony; and the defunct natives gave the most trouble of all. It should be stated that in this favored land the rude forefathers of the hamlet who have departed this life are disposed of in sundry and promiscuous ways, according, apparently, to the means or caprice of their friends. Some are interred; others, packed in boxes, are deposited in the fields; and others, again, placed in barrel-like earthen receptacles (happily described by a British officer as "jars of *potted ancestors*, by Jove! you know)."

When it came to disturbing these, opposition culminated, as the ideas of buyers and sellers differed materially as to the market value of "potted ancestors," and a crisis soon came. "Ven zey 'iss me," says the poor French actor, "I do not mind 'im mooch; but ven it coom to ze *or-an-ge-peel, c'est autre chose!*" So when scolding old women were re-enforced by barbaric hordes with uplifted hoes and shovels, the surveying party retreated in good skirmishing order, and reported at head-quarters. At this juncture came, most opportunely, the willing and efficient aid of a Chinese official, to whom much credit is due, and who secured the settlement of all claims and the condemnation of the needed land. Through his help, too, as I have always thought, was obtained the unexpected boon of a proclamation from the Taoutae, or Governor, of Shanghai, stating that the foreigners had the right to keep the road open for all time, and run thereon—what? "Cars," the interpreter said the word meant, and that surely was—enough.

Just here, and in anticipation of any misconception or hostile criticism of the spirit in which the subject is treated, it may be as well to put certain statements distinctly on record. Whatever may have been the opinions of the projectors of this railroad regarding the wisdom of treaty stipulations, or their impatience and disgust at the obstructiveness of the Chinese, they acted throughout in what they deemed a strictly legal manner. In a dispatch recently published, one of the most careful and conservative members of the diplomatic corps at Pekin says:

"The actual situation I understand to be this: the ground for the line has been purchased and paid for. The termini are Shanghai and Woosung, at the junction of the Whampoo and Yangtsze rivers. A line of railroad over this route would serve the convenience of foreigners in going to and from shipping detained at Woosung by a lack of water on the bar. There is a considerable Chinese population at Woosung who would assist in supporting it when opened. The ground was bought ostensibly for a *maloo* (or horse road), and I believe that the authorities knew that rails would be laid down for a tram-way.

"The leading motive of the promoters of the enterprise is a desire to exhibit to the Chinese a railway in practical operation, and thus to hasten the moment for a general introduction of railways into the empire.

"Every step taken thus far has been regular and defensible, saving, perhaps, that, in a strictly moral point of view, the ultimate object should have been declared from the outset. That this would have defeated the enterprise there can be no doubt.

"I am free to say that I sympathize most keenly with the promoters. They are striving to confer a ben-

eflt upon China. Their spirit is such that they will be perfectly willing to vary the plan to meet the views of the Chinese, so far as these are founded upon reason, or even upon prejudices which are strongly held, and saving always demands to abandon the undertaking. They believe they have a right to build a road over ground which they have bought and paid for. The promoters have been largely our countrymen. The corporation has become British.

"Under these circumstances our office at Shanghai may now properly withdraw from the leading position which it has heretofore taken. Such would not indeed be expected under the circumstances, and might be offensive to the British authorities.

"But, sympathizing with the purpose of the promoters as I do, and as I believe our government will, I advise you to co-operate with the British consul and your colleagues generally in their efforts to secure the peaceable establishment of the line."

These are words of truth and soberness, and it should be added that the directors regarded their silence as to their ultimate design as simply *pro formâ*. No well-informed or intelligent man doubted for one moment that the Chinese authorities knew exactly what the builders were doing, and were quite content so long as they were not called upon to commit themselves. The telegraph gave us a clear precedent; and if any thing might be considered as proved, it was that in matters of this kind the officials only wanted to keep their skirts clear of all responsibility. The Taoutae of Shanghai could thus run up an enormous bill for telegrams to Canton, or join a social excursion to Woosung, while fulminating the most indignant or heart-broken communication to his superiors about the inexpressible fierceness and wily tricks of the infamous barbarians.

The road-builders now felt that they had been successful in a high degree, and especially in keeping the matter quiet. Nothing was said or known of it on the "Bund." This word (Hindostanee, I think) denotes the fine water street of Shanghai running along the bank of the river, public garden and jetties on one side, and handsome and often imposing buildings on the other. It is the Fifth Avenue, the Rotten Row, the Champs Élysées, the Rialto, notably the Areopagus, of Shanghai. Here, after business hours, stroll the *taepans*, or heads of houses, the tea-tasters, and "mercantile assistants" (euphemism for clerks) of all degrees, and the "globe-trotters." Here are displayed the paces of the last pair of horses imported from Sydney, and is anxiously expected the *début*, in pony-phaeton or open sedan-chair, of the newly arrived bride; and here, of all places, is "the news" to be had in its freshest and fullest form. Like the worthies whom St. Paul met at Athens, the people on the Bund, "and strangers which were there, spent their time in nothing else, but either to tell or to hear some new thing." A rumor is called a "Bunder." "Why is old —— [a noted frequenter of the Bund] the most credulous man in Shanghai?" was a popular conundrum, the answer being, "Because he *re-lies* upon all he hears."

So the Bund knew nothing about it. The railroad-builders mixed in the gay throng, smoked social cheroots on the club veranda, and held their peace; and when at last all the world and his wife went to the paper hunt, and found out what had been going on, we grimly chuckled over the fact that *mum* had been so emphatically the word until the critical point was passed, and, as we fondly hoped, the success of our scheme was assured.

All the risk and expense of this achievement had been borne by a few people, to whom were added a few others after it was made public. To build and equip the road was plainly too much for local means. Times were hard; teas and silks were "depressed" (when will they be otherwise?); there was clearly a risk in the enterprise which prudence required should be largely subdivided; and it was to Great Britain, the land of iron and cheap capital, that the thoughts of the directors turned. Meanwhile it was determined to test the soundness of their views as to rights of property. Authority was given to the telegraph company, who were shareholders, to construct a line over the whole length of the road, and this was forthwith done. It was certainly fair to think that if Fung-Shuey would allow the invasion of its special domain by tall telegraph poles, it could not object to humbly creeping iron rails. The affair was managed with the tact and judgment which had characterized all the operations of the clever manager of the great company. When asked how he was succeeding, he replied that he had much less trouble out of the settlement than in it, where a man had refused to have the insulator attached to his house for fear that the current would *sour the beer* in his brewery adjoining! There have been vague rumors that some Buddhist priests, whose temples were used for warehouses at remunerative rates, had succeeded in propitiating the obstreperous deity; but only a sordid and suspicious mind could claim that there was any connection between the absence of all disturbance along the line and a visible increase in the physical well-being of the dozen petty district magistrates who took excellent care of the poles, and who seemed quite able to afford an extra shark's fin and glass of samshoo on an oft-recurring holiday. What was patent to all was that the line *was* erected and *wasn't* pulled down.

A few months later saw two members of the Board of Directors busy in London, and of their struggles and vicissitudes it is not desirable or permissible to tell in detail. They bearded capitalists in their dens, and bankers in their halls. They talked and

wrote and labored generally to secure the needed assistance; and after many ups and downs, and the necessary departure of one of the members of the committee, the other pushed the affair on to success. Never was a man better fitted for a task than he for this. I know of no one else who could have accomplished what he did; and while much credit is due to all who, from first to last, put their shoulders to the wheel, it is clearly by his intelligence, energy, and persistence that the building of the road was secured—just as his must be the keenest disappointment at the present miserable turn of affairs. His name, even were it allowable to mention it, would be familiar to but few of the readers of this Magazine, but none is better known in the China communities; and the present writer, in this brief mention of his eminent services in this cause, is prompted as well by strict justice as by warm personal regard. The representatives of the railroad who had charge of its interests in Great Britain brought two points prominently and persistently forward. One was that, in its early stage, the enterprise was naturally speculative, and that no one was to be accepted as a participator who was not able and willing to lose his money in case of unforeseen difficulties, and to do without dividends, if necessary, having in view the prospect of making this little road the entering wedge for a grand "China system;" the other was that every principle of prudence and sound business sense demanded that the road should be the simplest and cheapest construction that could be made to serve the purpose. This latter view having prevailed over conflicting counsels, a narrow-gauge road was finally built, from Shanghai, first to Kong-Wan—a city half-way to Woosung—and then on to the latter place. It was successfully opened, and its projectors felt rewarded for all their trouble, and looked forward to a career of prosperity and material progress.

The enterprise had now become clearly of British nationality, and it is not derogatory to one's patriotic feelings to say that in such things it is generally very desirable to have the support of a government whose foreign policy has been so vigorous. The reverse, however, is the case when said government has ulterior plans with which the enterprise may come into collision, with an excellent chance of going to the wall, and so it was, unfortunately, in this instance, as shall now be narrated.

The writer well remembers the impression made upon him, at a pleasant Shanghai party years ago, by a new-comer who had joined the dance. His face and figure were striking, and marked him to a careful observer as no ordinary man. It was the late lamented Augustus R. Margary, son of an old British general, and himself a rising member of the consular service. He had received the medals of the Royal Albert and other humane societies for swimming off, in company with Mr. John Dodd, during a typhoon in Keelung Harbor, and bringing the crew of a Chinese vessel ashore one by one; but he was not a man to speak of his own achievements, and he toiled quietly on in the service where "few die and none resign." In the mean time, under strong pressure, the British government had determined to explore a trade route from Burmah into Western China, and an expedition under Colonel Browne was ordered to start from Rangoon. To meet the expedition Mr. Consular Assistant Margary was chosen, and instructed to proceed up the Yangtsze, then due west. It was like leading a forlorn-hope, and it was done in the teeth of the greatest obstacles. Accompanied by one native and almost broken down by illness, Margary accomplished the journey and reported to Colonel Browne. Turning eastward with him, he was sent ahead to the town of Manwine to make some arrangements, and was attacked and speedily murdered. He was an officer of the British government, and travelling under imperial passes, and for this base and treacherous crime old Lord Palmerston would have exacted terrible penalties, if he had been obliged to storm the Peiho forts a second time. Even in these days of milder measures, it seemed clear enough that the preservation of British prestige required something like vigorous action. At one time it looked very much like it. The British minister made his demands, and in due course sent for the admiral, and had the fleet held in readiness. It really seemed as if this outrage was not to go unpunished, as the terrible "Tien-tsin massacre" had done; but all expectation of this kind was speedily disappointed. Instead of an ultimatum, there came more parleying—"*talkee-talkee pidgin*" the Chinamen call it. A commission, whose report, I believe, has never been made public, was sent to Manwine to "investigate," and soon there came forth to the world the "Chefoo Convention," an agreement understood by nobody, unsatisfactory to everybody, and unratified as yet by the British government.

Doubtless with plenipotentiaries, as with humbler men, "the heart knoweth its own bitterness" of complicated instructions, inadequate support, unforeseen obstacles, and vexing misconception, and they are entitled to the benefit of all doubts; but in this case it really seems as if some one might rise and explain. This convention has given one more twist to the tangled snarl of transit dues, and opened some ports which further subdivide a trade which was far more satisfactory when concentrated; but poor Mar-

gary's blood still cries out for retribution on his murderers. His gallant father has died of grief; and I venture to predict that the British name will be found to have received damage which will be ultimately repaired only at the point of the bayonet. In the course of these negotiations the wily mandarin brought up the matter of the poor little railway. Without a moment's hesitation this sop was thrown to the Celestial Cerberus; the property was valued, and a price set which the proprietors were politely instructed to accept. The money was payable in three installments, at intervals of a third of a year, during which it was agreed that the road should be operated by and on account of its original owners. The programme was duly carried out, and the money paid, and then "the Chinese pulled up the Woosung Railway." There is a report that the plant is to be taken to the island of Formosa; it might as well be Timbuctoo, or the kingdom of Prester John, for all that will ever come of it again. I can imagine the keen delight of the official charged with the work of demolition. A friend of mine always maintained that a Canton boy on the Pacific Mail steamer cheerfully accepted a largely reduced stipend in consideration of the privilege of tormenting the passengers three times daily with an old-fashioned and deafening gong. Something similar—*parvis componere magna*—must have been the feelings of the Chinamen who for the first time in this century had the pleasure of destroying the work of foreigners without a certainty of a Nemesis in the shape of the ubiquitous and inevitable gun-boat.

It is stated that the road-bed was to be left undisturbed; but the hardy sons of toil living along the line know better than that. Stick by stick, inch by inch, will the bridges disappear, and the road be annexed, as gradually and surely as Russia "rectifies" her Chinese frontier. It will be but a short time before the inquisitive "globe-trotter," asking his boy where he can see the railroad, will be told, "That lailloadee? No got. That countleeman hab stealum alla [*stolen all*]. Hab finishee!" But when he asks about the telegraph, it will be shown him, with the posts freshly painted, and a new insulator on each one. A friendly competitive game was played between a small party of Danish new-comers and a strong Anglo-American organization. We thought that we held the better hand, and returned their lead boldly, but they came out with the odd trick and all the honors. The telegraph stands, carrying its messages and paying its dividends. The railroad has "gone glimmering down the vale of things that were!"

EXPECTATION.

We rode into the wooded way;
Below us wide the shadows lay;
We rode, and met the kneeling day;
  We said, "It is too late.

"The sun has dropped into the west;
The mountain holds him to her breast—
She holds and hushes him to rest.
  For us it is too late

"To see the leaf take fire now,
To see, and then to wonder how
The glory pauses on the bough,
  While panting grass-tops wait."

When, lo! the miracle came on.
A road-side turn—a moment gone—
And far the sun low-lying shone;
  The forest stood in state.

Transfigured spread the silent space;
The glamour leaped about the place,
And touched us, swept from face to face.
  We cried, "Not yet too late!"

But one, who nearer drew than all,
Leaned low and whispered: "Suns may fall
Or flash; dear heart! I speak and call
  Your soul unto its fate.

"Tread bravely down life's evening slope.
Before the night comes, do not grope!
Forever shines some small, sweet hope,
  And God is not too late."

A RESCUE FROM CANNIBALS.

HULDA came down into the bowels of the earth to find me, as she usually was compelled to do. There was no necessity for her remaining amid the rust and roaches, the gloom and interminable steam, of that cavernous kitchen floor of ours on Brooklyn Heights. Why Heights, I wonder? We were on the steep side of the hill, and there was considerable more of depth than height about it—at least on the kitchen floor, where I spent the most of my time; for I superintended all the cooking for the boarders. We had kept boarders now for years and years, or perhaps the boarders had kept us, or it might have been a mutual eking out of existence. But I took care of the cooking, because in that the main strength of success lay, and I didn't want to keep boarders all my life.

When we began it was to please brother Bob. He was a well-to-do salesman then in the city, and used to come down to the dear old homestead with so many airs and graces about him, that we grew to look upon him with a sort of awe, and wondered if this prinky gentleman in the high hat and linen duster could be our Bob that used to kick all the bottoms out of the chairs, and never had a whole knee in his breeches; that robbed the birds' nests, worried the school-master, was nearly drowned in the mill-race, and had his leg broken by a fall from the hay-rick. Nobody would dream he had ever a kink in his leg, now that he had got to be a commercial man. He was as straight and tall as the finest of our scarlet-runner poles, and butter wouldn't melt in his mouth, he was that smooth and sleek and soft-spoken. How surprised we were when he proposed himself to go and hear David Devine's first sermon, holding the hymn-book all the way, and carrying Hulda's best shawl on his arm! I used to be his favorite in the good old days when he didn't know a snub-nose from a Grecian one, and Bob found my carroty hair and freckles much finer than the silken locks and delicate complexion of Hulda. He used to call Hulda a milk-and-water baby, and I was the one he came to in all his scrapes and short-comings. But, somehow, after he got to the city I never could find much favor in his sight, and had no relish for a dead delight. The boy was gone from me as utterly as if he lay in the old church-yard by sister Betty's side. The memory of him was far sweeter than any present delight in his prosperity.

I was always opposed to giving up the homestead when father and mother died, and going to the city to keep house for Bob. But Bob persisted, and won over Hulda, as he always did. I think he had a sneaking design from the first that Hulda should win the admiration of one of his employers—the bachelor member of the firm of Marley and Brothers. He came out with Bob in one of the vacations, and certainly seemed to admire Hulda, as one might say, *ravenously*. He ate more in a quiet way than any person I ever saw; and it seemed a very high compliment, in Bob's eyes, that while he was eating, his grave, owl-like eyes were fixed upon Hulda, though why I can't say, as I always did the cooking. I used to tell our young preacher, Davy Devine, that he couldn't expect the hot place would have the terror for me it had for others, seeing that I was used to the hottest corner, and rather liked it. David made some kind little reply in his pleasant way; and I must say my choice for Hulda had always been this handsome, fair-worded, pure-hearted, God-loving young neighbor of ours. He had always cared for her since they were children together, and I knew father and mother would have been well content to have Hulda the pastor's wife in the old Dutch church where they had gone together year in and year out, and now lay resting close by.

Hulda was little more than a child, but was taking kindly to the wonderfully pleasant ways of Providence just then; and after mother died she clung more and more to me and David. He and I used to talk the matter over, even to the furbishing up of the old parsonage, never dreaming but that all would be right. It seemed as natural to me as seed-time and harvest that Hulda should marry David, and walk up the aisle in her plain silk gown and close bonnet, and every body should say what a sweet wife was the young parson's. As for me, the homestead seemed like the foundations of the earth, that nothing could shake but the trump of Gabriel. It had been ours since our Dutch forefathers first grappled with the soil, and as long as *it* held on, why shouldn't I? There was plenty to keep me busy—what with the making and bleaching of linens and homespun, tending to the hired men in the summer, preserving, pickling, and drying fruit in the fall, I got few minutes to squander, save some sweet ones wasted on that dream of mine about David and Hulda.

But in the mean time Bob married a fashionable city girl, and in the hot seasons he brought his wife and children home. I couldn't find much fault with the girl, though I tried to hard enough; she spent too much time distorting her pretty hair out of its natural comeliness, and put as many queer artificial humps about her as a camel; but she had a winsome, cheery way with her, and I always had a weakness for beauty, be it in man, woman, or beast; and, besides, she always had a good word for the young parson, often luring Marley away

with her coquetry and wiles, so that David could have a word with Hulda.

"He's worth a dozen of that bald, blinking Marley," she would say, "and I'll do what I can, Magda, to foil Bob's plans."

She was such a good-natured creature I wish it had been God's will to spare her to her young brood, of which she was overfond; but while they were three manikins the gay young mother got cold and died, and nothing would do but we must go to the city to keep house for Bob. Hulda's tender heart was wrung for Bob's widowed and lonely condition, but I could see under his stiff, hard melancholy a bitter quantity of worldly forethought and speculation.

I knew what was coming, and, indeed, was prepared for any thing. What did it matter now that the blessed old homestead was out of our hold? I had kept some of the mahogany furniture, much to Bob's disgust, who seemed to cheapen the richest acres we had, and spoke slightingly of the knots and gnarls in our dear old apple-trees that every body knew made the fruit all the sweeter. Bob sniffed with disdain at my holding the mortgage for my share of the estate.

"Ready money would be much better, Magda," he said; but I had my way, thank God! And I told Bob up and down I wanted it understood that there was to be no obligation on either side—Hulda and I would take the city house, and he and the three children should board with us. To help along with the expenses I took a few more boarders, and still a few more, for one brought another. I had a sort of faculty for cooking, and if there's one weakness in the human race more prevailing and besetting than another, it's gluttony. I used to do my best to tempt the jaded yet voracious palate of that yellow dyspeptic Marley, and gave him many a grim hobgoblin for company after he'd left my sweet Hulda, for I couldn't forgive his winning her consent to marry him, when he knew the core of her heart was another's. The coming to the city and finding out how pretty she was had turned Hulda's head.

Bob's will and cunning were strong and untiring, and anyway Hulda gave up poor David Devine, and agreed to marry that grim and greedy Marley. I lay awake at night worrying about it—my heart was so sore perplexed for poor David, and wrathful against Bob, and distrustful of Providence. I grew desperate and wicked, but David stuck to his faith, dear fellow, though he hadn't strength to stick to the old spot where he had been so happy and so miserable. He went out as a missionary to some of those cannibal islands, where I wonder the women didn't eat him—he was so handsome and so good.

The very name of Marley became an abomination to me, and I forced a promise from Hulda that she wouldn't marry for a couple of years, during which time I hoped for Heaven knows what that was strange or remarkable. I had small doubt but that poor David was food for the fishes or the cannibals, for I had heard no word from him; but I kept on praying and hoping for a hurricane that might sweep every Marley off the face of the earth. Whenever Marley took Hulda out he brought a carriage, and as it wasn't Bob's way to waste any luxury, he used very often to occupy the spare seat—he and a sister of Marley's, a high-nosed, high-colored, big-toothed young woman called Judith. I saw what was coming, and I told Bob he'd regret it to his dying day, but he married Judith Marley within that year. She disliked the trouble of housekeeping, so he brought her to board with me. They took a suite of rooms on the second floor, and before she had been in the house a month she began to raise Cain, as I knew she would. Of which I was very glad. I should have been sorely disappointed if she had forced me to love her, as did the fond, flighty first wife of Bob; for to hate the Marleys had become my sole strength and tonic during days of endless labor and weariness of body and soul. The spite I had against the whole Marley race, that had spoiled my Bob for me, and wheedled my sister into a perfidy that broke the manly heart of David Devine—the spite I held for them one and all kept life in me when I should otherwise have fainted by the way. Bob saw that we couldn't live together, and took a furnished house down the street, for Bob was a big man now, and one of the partners of Marley and Brothers; but before Judith went away she gave me what she called a piece of her mind. By the grace of Heaven it so happened that Hulda said one little word or two in my defense, when the termagant turned upon her, and, among other insults, accused her of entrapping her brother into a marriage. Hulda did not reply, but there was something in her face that frightened Judith. She tried to eat the mischievous words, but I knew that the Marley link was broken. Poor Bob took up his wife's quarrel, though one could see this second honey-moon of his had rather a bitter flavor. I felt sorry for him and the three poor little step-children as they went soberly down to their fine new house.

I had Hulda to myself now, and will confess that I left no stone unturned to accomplish my purpose. I spared neither her suitor's age nor his infirmities, and repeated, with many a sly exaggeration, the taunt of Judith. So all poor Marley's entreaties, and the threats and wrath of Bob, were unable to mend the mischief of one woman's tongue. Hulda gave up Marley, and settled down with me to old-maidenhood and the

dreary monotony of keeping boarders. Even Hulda was past middle age when she came down to me that morning on the kitchen floor. As I said, there was no necessity for Hulda's remaining among the rust and roaches, the clatter of the dishes, and the bustle of the black serving-maids. I had kept Hulda the lady manager of the house. Her laces were real, while mine were any twopenny cheatery that came to hand; she rustled in her silks, while I got about in a gingham gown; but we worked together, Hulda and I, and the time had come now when we could shake the dust and ashes of this drudgery from our feet. It was growing hot for that early season of the year. I had been thinking all the morning of the budding larches out on the old homestead, and the tender green of the willow slips down by the meadow. It seemed to me I could hear the young lambs bleat, and catch the milky breath of the cows as they chewed their early cud. It might have been the steam of the boarding-house breakfast that dimmed my eyes as I whispered to Hulda:

"It's all settled. The boarders must be told to-day. We're rid of all this din and drudgery. I've paid the last cent on the homestead, and it's ours, dearie, to have and to hold forever."

"And shall we live there all alone, Magda?" she said—"only you and I?"

"I shall take Chloe to help about the house," I said; "but as to living alone, that's what I thought we'd been working and praying for. You certainly don't want to take any of the boarders along? Mrs. Post wants to bring her sick baby out for the summer, and that young student on the second floor back is pestering me to spend his vacation with us; but surely, Hulda, you would not begin our new life with boarders?"

"No, Magda, no," she said, with that little melancholy, deprecatory, exasperating smile of hers; and as she went away she left the germ after her of rather a bitter misgiving, which ripened into full maturity when we got settled in the old homestead, with all our household gods about us. These deities wore a rueful and rusty air. There was something out of joint. It was Time himself, no doubt. The tall clock in the corner didn't tick in the old cheery way, but put Hulda in mind of some weary jingle she had read, with the one refrain of "Never, forever—forever, never." I never could see, myself, the use of reading rhymes—either they are too silly or too grave—but Hulda had always been what they call romantic. I began to hate the approach of a moonlight night, for she would sit out-of-doors and run the risk of the ague; and when the air grew chill enough to have a comfortable fire on the hearth, Hulda spoiled it all by begging me not to light the lamps, and there she would sit in a blindman's holiday. I began to get the rickets myself; and though I wouldn't have owned to it for the world, I was sorry I hadn't brought out with me Mrs. Post and her baby, and the young student on the second floor back. For one thing, I hadn't enough to do. Chloe did all the kitchen-work, Hulda attended to the bedrooms, and the cooking that was left to me wasn't worth mentioning. It was enough to break one's heart to see the dishes come and go untouched and untasted. I would almost have been glad to see that greedy Marley come in for one hearty meal. There was nobody to brew or bake for; nobody to mend or make for; and, ah me! what a bitter cry I had one day when I stupidly stumbled into Bob's snuggery up under the eaves of the garret, and saw there the broken fishing rods, the old rabbit-hutches, the bird-traps, kites, marbles, and Heaven knows what and all! I couldn't get the boy out of my mind, and began, now that I had plenty of time, to think that I might have been a little hard myself, and grew to wondering about the children of Bob's first wife that I'd given over to the clutch of Judith Marley without one effort to cheer or comfort.

The hard Northern winter came on apace. All the little brooks froze tight, the tender green of the larches and willows had given way to red and gold, and at last there was no color or substance left them but their skeleton branches against a leaden sky. The snow came down in whirling drifts, and day in, day out, the old clock ticked the doleful refrain. I got out some patchwork, but put it away again—for who would inherit my handiwork?—and made up my mind we'd have no Christmas dainties that year to stare us dolefully out of countenance. Poor Chloe was getting dyspeptic already with overfeeding, and even her wool didn't tighten up in the old vigorous way.

It was the third day before Christmas, when a storm set in of hail and snow and sleet, so that it was all we could do to get the dumb creatures about the place housed and fed. When all was done, I set the logs to blazing upon the hearth, and happily kept a warm drink in the ashes for Chloe, who was still fussing about the kitchen. The wind roared around the house, swinging the branches of the trees against the weather-boarding; and said I, "Hulda, God save any poor creatures at the mercy of this storm to-night!"

"Amen!" said Hulda.

At that moment we both heard something like a human voice strained to the utmost, and Hulda started to her feet.

"Be quiet, Hulda," I said, myself far from easy; "it's only the shrieking of the wind."

But again we heard the voice, and again we heard my name. I reached for my cloak and hat, and buckled on my rubbers, while

Hulda stood trembling by, when suddenly the door flew open, and a great gust of storm and sleet came pelting in, driving before it a man and some young children he was huddling before him like sheep in a tempest. They were blinded with the storm and half frozen, but the boy dragged his sister by the hand, and poor Bob held the youngest child in his arms.

"Don't you know us, Aunt Mag?" said the little fellow. "I'm Bob, you know. The wagon all broke down, and we're jolly glad to get ho-ome." Here the little man began to cry, for his brave heart was overburdened, and the child in Bob's arms took up the refrain. Bob himself was white as the snow outside, and seemed dazed and bewildered.

"See here, Mag," he stammered out, "I've brought the children to you to board for a while. Every thing's at sixes and sevens in the city; Marley and Brothers have gone to smash; but I'll get something in the way of a clerkship again, and pay the children's board, you know; they sha'n't be a burden to you, Mag."

A burden! It didn't seem much like a burden. Such a glad commotion as those little ones created, Hulda and Chloe putting dry clothes on them, and tricking them out as if for a baby masquerade. The hot posset was poured down their little throats, and a bountiful supper was given them of hot milk and buns.

"There'll be something grand for breakfast," I said, looking upon them as greedily as ever poor Marley did upon Hulda. How the old kitchen echoed with their romps and capers! They were all handsome, every one of them, with Bob's fine make and build, and beautiful eyes like their pretty dead mother's.

"Bob," I said, choking yearningly over the thought, "if you'll give them to me, the whole three, I'll spend my whole life in making them happy; and after I'm gone, they shall have the homestead and every penny I've got in the world."

"Yes, yes," said Bob, who had never ceased shivering, and was now as hot and red as he had been white and cold, "I'll pay their board, Magda; this is only a temporary trouble. I hope to get a clerkship, quite a lucrative clerkship; but little Bob will never get through the storm—never! Keep hold of your sister, Bob," cried my poor brother, in a loud voice, "and keep the tail of my coat firm in your other hand; don't let go, my son, for God's sake, Bobby—don't let go!"

He got upon his feet, and seemed to be plodding through the storm, and as he made his way to the kitchen door I coaxed him on up to bed in his own old room, that I had kept aired and comfortable to lighten my own aching heart. When the morning dawned, and the doctor could get to us, poor Bob was wild in delirium; the only words he muttered or called aloud were about bonds and bills, dollars and fractions of dollars. His long white fingers seemed to hold a pen, and scratch, scratch the weary figures upon the counterpane till my eyes and brain ached for very pity.

For two wretched days and nights he struggled with this sordid misery, the fiend of commercial fret and disaster never letting go his grip; but Christmas morning dawned clear and bright, and before the eastern sky had quite lost its glory Bob fell into a deep, untroubled sleep. How white and wan he looked! How thin and bloodless were the once busy fingers that now lay limp and still!

Hulda and I wept our fill upon the landing, but not a sound disturbed the stillness of Bob's old room, for the doctor had shaken his head when we augured so hopefully for this slumber, and we said to one another it was the doctor's prim, old-fashioned way, but we went about on tiptoe nevertheless, and my heart kept choking up in my throat, I scarce knew why.

At noon-time the sky was all one blaze of cloudless sunny blue, and to keep the room dark I strove to fasten an extra shawl over the window. Suddenly I heard Bob whisper my name in such a strange voice that I got down quickly and went over to the bedside, and was puzzled to hear a low laugh from his trembling lips.

"Say, Mag," he whispered, "don't let mother know. I crept in through the window, and left some of my pants on the gooseberry bushes below; you'll patch 'em up, won't you, Mag? And keep mum about it. Such a lark as we had last night! Dave Devine and I painted the deacon's horse white and red; but keep mum, Mag—not a word for your life!"

I kept mum. God knows I couldn't speak. I had got my boy Bob back again, but there was a sore tugging at my heart-strings. The doctor came and lingered long, then he turned to me—"My work is done," he said. "I was afraid from the first it would be useless: a higher and better work has begun. There is some one down stairs—a stranger in these parts, but no stranger to you or me, or this dear lad lying here. I wouldn't like to bring a new face among you just now, but this one will do. Bob," he said, leaning over my poor brother—"Bob, here is an old friend to pray with us on this dear day that Christ was born."

Then there came into the room a man with brown skin and lusty growth—his hair was almost white, but his eyes had a familiar loving glow dear to the olden time. I did not care to question who he was or whence he came, but knelt silently at the bedside while he prayed.

Bob's lips moved, but only with some boyish memory, and hour after hour went by. The day was at last waning; I was alone with my brother. I heard the light breathing of his children, and mine now, in the room close by; the low voices of David and Hulda reached me once in a while from the lower floor. I might have been a hard and bitter woman, but as at last the day went out and took Bob with it, I felt a grim delight in my sore and aching heart that he was beyond the reach of the Marleys.

Editor's Easy Chair.

WE were speaking last month of the romance of English life, which springs from a long historic perspective and poetic association, and which gives a peculiar charm to the biographies of famous Englishmen. A correspondent, Orlando by name, a well-read and intelligent man, says that he has observed the fact, and adds that he regrets to say, also, that it is as true of political as of literary men, and that, with all his American feeling and admiration of our system and its results, he can not find our historical or biographical politics as interesting as those of the "old home." "I read Macaulay and Burnet, Clarendon and Carlyle," says Orlando, "and the lives of Walpole and Pitt and Fox and Burke and Romilly, and Horner and Mackintosh, with the same zest that I read Scott's novels. Such reading is an endless delight. A book, for instance, like that mentioned by the Easy Chair a few months since —the life of Prince Albert, who was not a great man, however exemplary—is more interesting than almost every American political biography that you can mention. What is the meaning of this? And if it be the common feeling of American readers, how do you explain it?"

Orlando's remark, so far as it concerns the inadequacy of American political biography, is certainly true. For a peculiarly political people, we have unquestionably the most indifferent stories of political leaders. What a gallant and picturesque figure in our politics is Henry Clay; but to what biography shall the young student be referred? How positive, and in the course of events almost sinister, a power was Mr. Calhoun! But there is no tolerable life of him. Going further back, there is still a singular paucity of good memoirs of public men. Mr. Charles Francis Adams's life of his grandfather, the heroic John Adams, is perhaps the best of its kind. Irving's *Washington* is charming, but Irving had no taste for politics, and a glance at Van Buren's *Origin of Parties* shows at once the inadequacy of Irving's account of the political part of Washington's career. Mr. Morse's life of Hamilton is the only one worth consideration. But admirable as it is as a contribution to the subject, it hardly fulfills the conditions. Randall's *Jefferson* is a laborious and ample work, but it has little other attraction than that of the events themselves. John Jay's memoir, well written by his son, is valuable for its facts, but not interesting as a story or a picture. It will not hold its own with the young American reader against the life of Romilly. Sparks's life of Gouverneur Morris is a collection of material, it is not a memoir.

Madison is wholly without an adequate biography. The bulky volumes of Mr. Rives, so far as they go, supply only valuable information, but tell no story. The stately volumes of John Quincy Adams's *Diary* are a mine, but not a biography. The life of Webster is not yet written. Mr. Parton has given us memoirs of Benjamin Franklin, Andrew Jackson, Thomas Jefferson, and Aaron Burr. The first of these is among the best of all American biographies, and the second is an illustration, in many ways, of the general manner in which political biography should be treated. The other two are very interesting and entertaining, but they seem too partial, and are read with a distrusting protest. Edmund Quincy's life of his father, Josiah Quincy, is a model; and Mr. Cabot Lodge's life of George Cabot is among the very best memoirs, while his magazine sketch of Timothy Pickering is masterly. As yet we have but one volume of Mr. Seward's life; and we have two of Mr. Sumner's, which do not extend to his public career, but which are singularly delightful from their glimpses of the best European society of his youth.

These are a few of the biographies of our public men. But no one can run over the list of our noted political names without confessing that the memoirs are singularly wanting in that fascination which is felt in the story of English statesmen and statesmanship. The reasons are perhaps obvious, and three are prominent. In the first place, our great tradition of avoiding entangling alliances and of taking no part in European politics has necessarily secluded us from the great political movement of Christendom, except as we have morally influenced it, and such influence has been hitherto wholly paralyzed by the continuance of slavery. A slave-holding republic could be neither a reproof nor an exhortation to monarchies, more or less constitutional, which had abolished slavery. Besides, the political centres of the world were elsewhere, and politically we had no relations or alliances with them. Our politics have been, therefore, local, affecting ourselves only, and consequently involving domestic details of no universal significance. When Canning was "calling a new world into existence to redress the balance of the old," and supporting the Spanish popular movement against the Holy Alliance, we were lapsed happily in an era of good feeling, and were burnishing our arms for the Missouri struggle. In the European capitals, also, was gathered the most brilliant society in the world—a society of renowned names and historic associations, social hierarchies whose influence upon public affairs was most subtle and profound, and which decorated the story of statesmen with the splendor of courts and aristocratic rank. The main current of history was in Europe, and not in America. The fountains, indeed, might be gathering fullness on this continent, and the general welfare of a part of this country be very much higher and greater than in any part of Europe. But although happy be the country whose annals are dull, dull annals are not fascinating reading. Châteaubri-

and was a very much smaller figure than many conspicuous Americans. But Châteaubriand conducting the foreign relations of France under the Bourbon reaction was a more romantic personage, and his story, even in Alison, more attractive, than that of John Quincy Adams—one of the most accomplished of public men—arranging the Panama Congress. One, amid accessories that strike the imagination, was dealing with the great course of public events; the other, among details that can not interest, was quite outside of "world politics."

This counts for much in explaining the difference that we are noting. But there is another reason somewhat like it, and that is the structure of our government, which offers to the world no focus of interest. In other words, our politics are largely State politics, and the subjects of national consideration have hitherto been as few as possible. Jefferson defined the general or national government as a department of foreign affairs; and as our commanding tradition was hostile to foreign alliance, our statesmen took no part, as we have seen, in the question that engaged all other statesmen. This was amusingly illustrated in the first years of the century. When the tread of Napoleon shook Europe and aroused Christendom, when all the romantic spirit of young Germany flamed into life which survives in the music and literature of the time, and when progressive liberty was really imperilled, Mr. Jefferson proclaimed the embargo, and America curled up in its shell. It was very possibly true that we were building a house for the repose of the combatants when the struggle was over, but meanwhile

> "All day long the noise of battle rolled
> Among the mountains by the winter sea,"

and the heroism, the sacrifice, the splendor, and the significance of the strife were more alluring than the spectacle of raising a building. Our statesmen, moreover, stood on no historic scene and in no perspective. They assembled in a town improvised between woods and a river, a spot without a single inspiring association, without a sign of that vast and nameless charm which inheres in an old community of cultivated persons, bred among the richest accumulations and influences of literature and art and social tradition—a capital in which the weekly wash of the chief of the state was hung in his drawing-room to dry. In this bare and hard seclusion they discussed tariffs and laws of Indian settlement. Congress was a frontier Legislature regulating land titles and road-making. But all the concentration, the central interest, that belong to the Parliament of a country which has no other, assembling in a magnificent metropolis, the fountain of enormous influence of every kind, has been wanting to the older men in our political history.

Another reason of the inferior interest in such works is perhaps as obvious. It is the absence of high literary training, and of that sense of the commanding eminence and dignity of public political life which distinguishes other countries. In one sense we are the most political of people, but politics and the prizes of politics do not have that hold of the public imagination which naturally would be expected. In all our novels and stories how slight is the interest in such subjects, how few turn in any way upon politics of any kind! But, above all, it is the biographer who makes biography interesting. The lives of English statesmen have been largely written either by members of their families trained at the universities, or by other statesmen, their disciples, or by accomplished literary men. Their heroes dealt with affairs of universal interest, amid the most imposing and effective influences, and even if the biographers had merely edited their letters and papers they would have made their books most interesting. But three illustrations will show what they have done: Stanhope's *Pitt*, Macaulay's account of the great Whig statesmen of the Revolution, and Trevelyan's life of Macaulay himself. It is true that he was a literary as well as a political figure. But so was Burke, so was Canning, so are Gladstone and Beaconsfield; and if our statesmen are seldom so, that is also one of the reasons why their memoirs fail of an equal interest with that of the lives of great Englishmen. The works that we name show what an immense advantage there is in skillful literary treatment. The art of literature, the power of literature as an art, is not yet sufficiently recognized by us. What a book, for instance, a trained and accomplished writer might make of the life of Clay! How much he could tell the American public which it does not know of the war of 1812 and its party history, of the South American question, of the great debates and movements of public opinion upon the tariff, "the American system," internal improvements, and the Bank! Henry Clay was not the greatest of men, but he was a fascinating figure, and the one around which those subjects naturally group themselves. If any reader thinks that they are "dry" topics, he has but to turn to Macaulay's account of the English treatment of its debased currency in 1696 to see how interesting and clear even the story of a sound regulation of national finances can be made.

Indeed, the most that can be said, perhaps, is that we do not know how interesting our political story is, because it has not been adequately written, either in biography or in history. Mr. Bancroft thus far ends with the Revolution. Hildreth comes only to 1820, and with all his virtues, and conceding the extraordinary value of his annals, it will not be urged that he was a great literary artist. Mr. Gay's history, ample and admirable for the period which it has thus far covered, has not yet reached modern American politics. Their story must be sought in many imperfect and unsatisfactory works. Yet the well-written biographies of a very few men would give us a complete and continuous political history of the United States to the end of the civil war.

The season brings with it the problem of the grog-shop, the great source of poverty and crime. The temperance orators will begin anew, and the annual appeal will be made for aid and sympathy. The sum of money that is given every year to maintain the agitation, to pay lecturers and colporteurs, and sustain publications of every kind, is enormous. Into every little village in certain parts of the country comes the agent, knocking at every door, and begging a little money to aid so holy and humane a cause. Blazing batteries of statistics are opened against the evil. Petitions, nominations, conventions, sermons, speeches, confessions, tea parties, fairs, festivals of every

kind and degree, promote the work. It has been going on for fifty years. Rum and brandy have been placed under the ban. From ordinations and funerals and christenings they have disappeared. The teeming sideboard and the whiskey bottle urged upon every caller are confined mostly to Washington and the political capitals. At hotels the conscious citizen is shy of ordering wine, and the stoutest hearts palpitate a little in public dining-rooms at the pop of Champagne. Even at many hotels the wine list has vanished from the bill of fare. At others there are dark and devious ways to be trodden before the liquor is obtained, while in the very height of the season at Saratoga and Newport it is evident that the habit of wine-drinking is declining. More palpable but not more significant signs of the results of the long agitation are the various forms of prohibitory or restraining laws—the Local Option and the Civil Damages acts.

Is drunkenness diminished, or has the crusade merely driven the habit of drinking into concealment? Do the statistics show less crime from the use of ardent spirits? Is there a fair net return in greater sobriety and in general social morality from the vast expense that has attended the agitation? It is impossible to answer such questions definitely or satisfactorily. The causes of social changes are always complex, and the greater or less good conduct of any community depends often quite as much upon the feelings from which movements spring as from the actual measures that are taken. Even if answers could be furnished, they would affect action very little. The temperance movement is moral. The spectacle of the debasement of human nature, the ruin of domestic happiness, the endless crime—these are the springs of the agitation, and while these continue the work will go on. We say generally that it began in this country half a century ago. But really it began before the middle of the last century in England. As a source of crime drunkenness challenged the attention of the state, and Sir Robert Walpole, who was in no sense a Grand Worthy Patriarch, undertook to stem the current. He could not do it, and he yielded. "Drunk for a ha'penny, dead drunk for a penny," was too much for him. The moral aspect of the agitation has never been so prominent elsewhere as in this country. And since it is a work sure to continue, and to be constantly stimulated by individual observation, it is fair to criticise methods, and to ask whether they have been wisely chosen.

Has not the temperance movement in this country been too exclusively a moral appeal? Has it not forgotten too much the nature and the circumstances of the evil? Temperance addresses are largely descriptions of the effects of drunkenness. They are tragi-comedies, in which the speaker seeks to make his audience laugh at the antics of the drunkard, and cry over the broken heart and ruined home of his wife and family. This strain is varied with thundering denunciations of "the moderate drinker," compared with whose insidious infamy the immoderate drinker who totally imbrutes himself is an object of pity rather than of reprobation, and with these are mingled chemical and sanitary statistics. The appeal, however, is moral, and the remedy usually proposed is absolute prohibition. The friends of "license," however stringently regulated, are regarded as mere Laodiceans, or worse. But this mere moral appeal to renounce drunkenness because it produces crime and unhappiness and disease is too arid. It forgets the persons to whom it is addressed, and the conditions of their life. Consequently there are the excitement and fury of a revival, vast temporary enthusiasm, and swift backsliding.

For what is drunkenness? It is in its origin the perversion of a natural taste for social enjoyment, and it is most prevalent among those who have the least opportunity for such enjoyment. When it has fixed itself upon its victim it is largely dependent upon physical conditions. The usual temperance appeal to him is by the mere main strength of his moral will to break up the habit. His home is bare and desolate, and the preacher urges him to prefer it to the cozy and warm and social "saloon." His system, enfeebled by excess, craves the stimulant, and the exhortation is simply not to take it. He needs especially every kind of support and assistance and diversion, and he is told to help himself. This is a relief which forgets the nature of the disease. That of itself suggests the remedy. The drunkard seeks social enjoyment illicitly. Supply it to him lawfully, show him that he can gratify his natural tastes without shame to himself or harm to his family or society. Give to the weak system which craves "a little something," a little something that will cheer and not inebriate. The drunkard knows the misery that drunkenness produces, for he is its victim. He does not wish to hear of that. The incipient drunkard knows it also. What they want is something to take the place of drunkenness, something that will help them to help themselves. If all the money that is yearly given to support talking upon the subject were devoted to doing something in the way suggested, the "liquor interest" would be confronted with something that it would fear. "Holly-Tree" inns upon a great and general scale, "public coffee-houses" like those in Liverpool, neighborhood clubs which would develop and illustrate the neighborly sympathy which is now not suspected, and the supposed absence of which is most mischievous—all these and similar enterprises would be a temperance movement which would aid the moral appeal and the sanitary argument with those social sympathies and supports which are indispensable to the prosperity of the work.

The Easy Chair has elsewhere praised the honorable contests of college men. But there are some relics of barbarism yet lingering in colleges and schools upon which this seems to be a proper pulpit to preach a short sermon. The American boy is justly indignant with British "fagging," and the American boy grown into a man has his own theories about the origin of a certain brutality which he thinks he perceives inhering in the Englishman brought up on a fagging system. Taine evidently thinks that the veneer of civilization is very thin indeed upon many British Berserkers. They seem to him under a slight enchantment of civility, but at any moment the original barbarian will burst out with a bound, as the white cat transformed into a princess could not without a spring see a mouse running across the floor. Thackeray saw fagging with American and human eyes, and in his Doctor Birch shows what the abuse is.

But the American boy must remember the argu-

ment urged for the system of fagging. "It makes fellows manly. It teaches them to be self-denying and obedient. It teaches them also to serve, and prevents them from the evils of cockering and pampering." This is the traditional regulation plea. "Besides," continues the argument, "the proof of the pudding is in the eating. Is there a manlier nation than the English? Are there braver and better leaders of men, on sea and shore, in battle and in Parliament, than the well-fagged graduates of the English schools?" The youngest American boy would scorn so absurd a *post hoc propter hoc.* Such generalizations are as easy as they are ridiculous. They would credit Marengo to French *bouilli*, and Russian valor to *caviare.* The English-speaking race has produced heroes of every kind on this side of the ocean. But none of them were ever fags. Mere endurance can be bought at too high a price. The evils of slave-holding are not cured by the fact that the master may have been a slave. With all the theoretical excuses, the practical effect is brutality, and the argument is much the same with fagging. An ideal fagging is conceivable, but it is not practicable.

But while the American boy at school and college spurns this barbarism, what if he fostered it in another form? The mischief of fagging is that of great and irresponsible power in little things. What is hazing? How is hazing more manly or decent than fagging? If it is to be viewed as practical joking, and the freak of the irrepressible spirits of youth, why should not fagging be regarded as the wholesome training of rough discipline? If a crowd of "Sophs" may toss a "Fresh" in a blanket, why should not a fellow in an upper form properly fag one in a lower, and what have the blanket-tossers to object to it? The ducking of one man in a horse-pond by a dozen of his neighbors is undoubtedly as neat and pointed and pretty a joke as those described in *Evelina;* it is, perhaps, full of wit and humor. But we must not deny the equal exquisiteness of the jest of forcing a fag to kindle the fire before dressing on a frosty morning. These are perhaps excellent sports. They may argue a keen sense of humor and a kind heart. But the jokers must not quarrel with the form of each other's jests.

In the American school, for instance, as a Vermont paper says of graded schools in that State, a new pupil is subjected to the "school bite," which is a slap on the back from the fist or the open hand *ad libitum;* and upon passing into a higher grade, he is seized by four boys by the legs and arms and thrown up into the air to fall upon his back. If he admits that he is "rotten," he is spared; but if he insists that he is sound, he is thrown again. This capital fooling has developed spinal disease. But nothing certainly could be more excellent jesting; and, as a commentator truly remarks, it is only the fruit of exuberant spirits, and takes the nonsense out of mollycoddles and milksops. Who wants a boys' school to be a prayer-meeting? adds the commentator, or that boys should behave in their sports like deacons? Boys will be boys, and hazing is but boys' fun. That seems to end the argument. If throwing a fellow in the air to fall upon the ground on his back a few times is fun, of course every body enjoys fun, and there is not a parent in the land who will not wish to contribute to the general amusement.

Besides, its moral advantages are as evident as its fun. It is well known that nothing is better for children than to accustom them to stick pins through flies, and to watch the taking off of chickens and pigs. It fosters a kindly feeling, a habit of humanity, a sensibility to pain, a sympathy with every form of suffering, which refine the character and elevate the mind. Flies and chickens and pigs can not help themselves. It is so with the new pupil. He is helpless; and when a crowd of older, bigger, and stronger fellows fall upon him and treat him to a ducking, or a throw up and fall, they are not only making a joke which is suitable for their time of life, and which all healthy-minded persons must enjoy, but they are humanizing and refining themselves. They are sure to be better and more manly men for having broken the back of a boy who can not help himself. The schools and colleges which cherish these manly sports have also a natural contempt for the British pupil who fags, and for the fag who submits. If British boys would see the fair play of boys who scorn fagging, let them contemplate the hazing of an American college or academy.

If "international" contests between athletes of any kind settled any thing, the interest which attends them would be something more than a mere gambling interest. Two generals stepping out to decide a battle by single combat offer a chivalrous spectacle which tradition and romance have furnished. But a struggle of any kind which is shrewdly suspected to be, in the slang phrase, "a put-up job," has no real interest whatever. It is unfortunate that every athletic contest except that of known amateurs is now liable to that suspicion; and it is upon that feeling that the advice of old college men to under-graduates is founded: "Beware of professionals." The opportunities of gambling in games upon which heavy bets are made, and in which success depends upon individuals, are immense. If at base-ball the blues and the reds are fairly matched, and a gamester can persuade a blue to share his bets that the reds will win, the blue can make the red win. His side loses prestige, indeed, but he pockets his winnings. It is a foul trick, perhaps, but, bless you! even base-ball players must live. It is hardly fair to demand of professional sportsmen a higher morality than is expected of other professions. The short-cuts are as tempting in games as they are every where else.

The papers were full in the autumn of accounts of a great scull match to be rowed upon the St. Lawrence, over the Lachine course, about nine miles from Montreal. The contestants were Hanlan and Courtney, the former a Canadian, and the latter a New Yorker from Auburn. The race was for twenty-five hundred dollars a side and the "championship," and six thousand dollars were to be presented to the winner by "the people of Montreal." The interest in the matter was prodigious, and the greater it was, the more amusing. Sporting circles on both sides of the sea were thoroughly aroused. The newspapers published letters and telegrams, and properly, because there was a great desire to know all about it. Hundreds of thousands of dollars were said to be staked on the issue, and when the day of the contest came there was an expectation in "sporting circles" like that which precedes a great battle which is known to be imminent. The intense

excitement was but deepened by the telegraphic announcement of a high wind which ruffled the water so that the race must be postponed.

Meanwhile an enormous crowd had assembled to see the conflict, and the next day on the grand stand alone there were seven thousand persons. The river was calm, the rowers in good condition, and toward sunset they "caught the water." The course is about five miles, and away they went. They "pushed" and "dashed" and "spurted." One led, the other lost, a little; then they were neck and neck. At about half-way "the grand struggle began" with "magnificent spurting" on both sides; but the Canadian Hanlan finally pulled just ahead, and won by a length and a quarter in thirty-six minutes and twenty-two seconds. It was a famous victory. But there came simultaneously the rumor that Courtney had "sold out," to the great indignation of those who are of opinion that it should have been "the greatest match of the century," and have made "an epoch in aquatic history." Aquatic history, however, is now left to deplore the possibility that a match where "the betting should have been even" was not bravely won, but basely sold.

There are plenty of morals to be drawn from the text, and it is singular how "manly sports," when they are professional, become closely associated with knavery. The race-course was always condemned by the religious sentiment as a swift descent toward every kind of dissipation and unrighteousness. To go to races was hardly less offensive than to go to the theatre, and whoever went to the theatre was plainly on the high-road to another place. "Sporting circles" are always apt to plume themselves upon manliness and honor and gentlemanliness, but 'tis a queer honor that is bred at the races or the gaming table. The charm of college contests is that they are above all suspicion. College men do not row and play ball for a living. They are like knights who rode into the lists to joust honorably for their lady's favor, and for the smile of the queen of love and beauty. Whoever chooses to wager upon the event does so fairly and without suspicion of collusion. The interest that attends such rivalries is at least legitimate. A contest between the Harvard and Columbia or the Oxford and Cambridge crew does not, indeed, settle the fate of nations, nor even deal conclusively with the problem of effete monarchies, but it is unsullied by any unhandsome doubt or surmise. It is a fair contest of generous rivals, and an honest determination of the relative value of methods and training.

This has ceased now to be true of the ordinary contests of other athletes, and the excitement and interest in them are as absurd as they would be in the performances of jockeys who are bent on gain and not on glory. It is exceedingly ludicrous to remember that the "Benicia Boy" going out to "mash the nose" of his British opponent was regarded with a public attention and newspaper mention like that of Beaconsfield going to the Congress of Berlin. Throngs gathered at the bulletin-boards to read the details of tapping the opposing knowledge-box, drawing the claret, and closing the peepers. If an Austerlitz or a Waterloo, a Sedan or a Plevna, had been pending, the eagerness could not have been greater. There was nothing whatever at stake. The sole question was which of two bruisers would first beat the other helpless. When that was ascertained, those who had bet on the wrong man would swear that there was foul play, and an enlightened public would believe it. This is the present situation of international professional contests in the various manly arts, and "werry nice it is," quoth Mr. Weller.

It was impossible to read Mr. Gladstone's recent paper, "Kin beyond Sea," without wondering how his English brethren would receive it. Nor can any body be surprised at the scolding which he receives from those who are never friendly to him, nor even at the silence of papers which are usually just. There is an amusing bitterness in some of the comments, as if an Englishman of superior intelligence, in saying that he thought the present commercial supremacy of his own country would some time pass to another, were in some way a moral traitor to his native land. It is not easy to decide whether the critics think that the wrong lies in holding the opinion, or in expressing it. But it is very clear that their comments are an illustration of that pseudo-patriotism which is very absurd. National greatness does not appear from stout asseveration, but from demonstration. It is a fact, not a boast. The philosophic student of history and of the movement of his time may see that pending changes, the development of inventions, the natural growth of empires, will so affect trade or population as to involve a transfer of some kinds of ascendency from one country to another. It is exquisitely ludicrous to suppose that to state such conclusions is to aim a blow at any country. On the contrary, it is in the power of such discernment that the loftiest genius of statesmanship lies. The Venetian or the Genoese who saw the command of the seas passing inevitably into the hands of Britain was not bound to keep silence, but rather to speak, that his country might be fore-armed for the event.

The offense of Mr. Gladstone is very simple. He is alluding to what he calls the special interest of England in this country, and he says that he does not speak "of the menace which, in the prospective development of her resources, America offers to the commercial pre-eminence of England. On this subject I will only say that it is she alone who, at a coming time, can, and probably will, wrest from us that commercial primacy. We have no title, I have no inclination, to murmur at the prospect. If she acquires it, she will make the acquisition by the right of the strongest; but in this instance the strongest means the best. She will probably become what we are now—the head servant in the great household of the world, the employer of all employed, because her service will be the most and ablest. We have no more title against her than Venice or Genoa or Holland has had against us." These are not improbable conclusions. No man of the English race, of very great sagacity and familiarity with history and the springs and course of civilization, can contemplate the character, the growth, and the condition of this country without perceiving at least the extreme probability of such a result. The announcement of the probability could be regarded as distrust or betrayal of the student's own country only by a smaller sagacity and a pinchbeck patriotism.

The criticism upon Mr. Gladstone is an out-

break of the same spirit which leads the caricature Brother Jonathan, the lank sharper in a swallow-tailed coat and star-spangled trousers, to spit upon the Parthenon, and find Europe monarchical and mouldy. It is the travesty of genuine patriotism. In reading the paper in question it is impossible not to feel how genuine an Englishman Mr. Gladstone is. He is not, indeed, an Englishman like Addison's Jacobite Tory squire whom we have before mentioned, who had seen no good weather in England since the Revolution. He does not satisfy his English soul by denouncing popery and wooden shoes, nor personify his countrymen to his imagination as a fat-witted boor. He has Andrew Marvell and Philip Sidney in mind, Milton and Falkland, men who differ, but who are of large souls and generous hearts, and to such men he says plainly what he thinks, and thinks as an Englishman and an honest man. It is evident that political England and America represent, as he says, the two greater branches of a race born to command, and that, while interested in the way in which we are working out the common destiny, his sympathies are with the way of his own branch. Indeed, he points out the ways in which English institutions give more rapid effect than ours to the will of the people, and it is evident that he believes liberty, upon the whole, to be surer of a steadily progressive development under the political forms of England. His offense, therefore, is not that he prefers American institutions to those of his own country, but that he sees economical and commercial reasons which will enable America at some time to wrest the commercial primacy of the world from England.

Mr. Gladstone's position is singular and noble. Without office or patronage, he is the great leader of the best opinion of England, and he leads without the slightest flattery of popular error or pandering to popular prejudice. His paper upon "England's Mission," and this of "Kin beyond Sea," are so full of the suggestions of a wise and patriotic mind that they must necessarily command the attention of English intelligence, and wield great influence. Institutions that train such a public character as his are not unworthy even of our careful consideration. How many of our leaders, in the same relative position to a great party as he, would dare to speak of their country, its mistakes and its tendencies, as boldly and truthfully as he has spoken of his country in these articles? Mr. Gladstone is, as we might say, the certain executive head of his party if it came into power, and if he would accept the position. Now

> Survey"

our Presidential candidates from sea to sea, and declare how many of them are as free and frank as the leader who holds the British conscience fast and firm against Jingo delirium. Patriotism is not the incessant assertion that our own country is the greatest and best; it is incessant vigilance to make it the greatest and best.

Editor's Literary Record.

ONE of the beneficial results of the revived taste for ceramics has been the stimulus which it has given to the creation of a refined and instructive literature, illustrating the art from the several stand-points of the poet, the savant, the amateur, and the specialist. In our own country the contributions to this literature have been of the highest rank and value, conspicuous among them being Prime's scholarly and elegant volume on *Pottery and Porcelain*, and Longfellow's preeminently picturesque poem, in which, like another Robin Goodfellow, the poet puts "a girdle round about the earth," and at one glimpse reveals the origin and progress of the beautiful and useful art in widely distant lands and times. No work, however, has yet been published which responds so satisfactorily to the prevalent demand for full and practical information on the subject as Miss Young's conscientiously executed volume on *The Ceramic Art*,[1] which she modestly styles a compendium, though it is so full and elaborate as to leave little untold that is either useful or desirable. In a well-written introduction she prepares the way to the more technical consideration of the subject by a comprehensive historical sketch, in which she traces the shadowy origin of the art in the legendary period of the ancient nations, describes its direct or reflex influence upon their religion and literature, and shows how it illustrates their history and preserves the record of their manners and customs. She then analyzes the ingredients that contributed to the diversity of the art in each nation in the particulars of form, color, design, and utility, and finally, having shown how it illustrates the art ideas of all nations, as well as how it has influenced art in general, she glances at its present aims, accomplishments, and possibilities, and concludes with some tasteful suggestions as to its place in the household, and on the combinations by which it may be made to enhance the beauty and attractiveness of our homes. The technical portion of the work is comprised under the head of "Nomenclature and Methods," and discusses, with the least possible resort to technical or abstruse terms, and in a manner so elementary and gradual as to be easily understood by the amateur, all that needs to be known as to the terms used in the art; as to the distinctions that are made between the various ceramic products, based upon the material or methods employed or the place of their manufacture; as to their original introduction into Europe, and the various progressive discoveries which led to their established production there; as to the several classifications of art products which have been suggested, with those which are the most satisfactory; and finally, as to the composition of the various Oriental and European wares and glazes, with the processes employed in their manufacture and decoration. The remainder of the volume is devoted to the history of the art in the Orient, in Europe, and in America.

[1] *The Ceramic Art:* A Compendium of the History and Manufacture of Pottery and Porcelain. By JENNIE J. YOUNG. With 464 Illustrations. 8vo, pp. 499. New York: Harper and Brothers.

Under the Orient we are shown the several stages of the art from the earliest times, and the results developed at each stage in Egypt, Assyria, Judæa, India and Central Asia, China, Corea, Japan, and Persia, and are given abundant examples of their different styles, with estimates of their comparative excellence as works of art. Under the head of Europe we are led back to the fountains of the art in the countries bordering the Mediterranean, and are made to follow the stream in all its shifts and turns, from Greece to Spain, Italy, France, Germany, Central Europe, the Scandinavian and Sclavic nations, and Great Britain and Ireland. As we move forward with our enthusiastic and intelligent guide, we stop now and again to trace the peculiarities of form and color which it takes on in each new land, to estimate how much of its volume is derived from its new home and how much from some parent source, and we linger on its banks to admire the beauties or criticise the defects which are offered for our scrutiny. The concluding book, which is appropriated to the ceramic art in America, comprises an account and classification of the aboriginal remains in South and Central America and in the United States, and an outline sketch of the origin and present condition and prospects of the art in our own country. As has already been intimated, the illustrations in this elegant volume are very numerous, and present a greater variety of characteristic examples of the most perfect wares of all nations, largely drawn from American collections, than has ever before been grouped in one view.

It is easy to foresee that, by reason of its intrinsic interest and the conflicting verdicts that will be passed upon its merits or demerits, *Like unto Like*[2] will have a large circle of readers. The first impressions of which most readers will be conscious will be a sense of enjoyment, caused by the charming bits of description which are freely but not too lavishly distributed over the narrative, and a feeling of surprise excited by the subtlety and skill with which delicate shades and difficult traits of character are delineated. And yet the book is much more than a collection of pen-pictures. It is a genuine novel, fresh, bright, eventful, and telling the old story of love with zestful spirit and grace. Moreover, it is an American novel, whose scene is laid in that ample store-house of indigenous fiction, the South, and its story is genially illustrative of the varied aspects of social, family, and plantation life, and of the typical customs, virtues, foibles, peculiarities, and prejudices belonging to each, as they have existed there since the war. To give an outline of its plot would be an acceptable performance to those only who read a novel as witches are reputed to say their prayers, and it will be enough to say that it is so cleverly constructed and so ingeniously unfolded as to pique curiosity, and that it is diversified with a sufficient play of vicissitude, and peopled with a large enough variety of contrasted or related characters, to entitle it to be styled dramatic.

Although the actors in *Sibyl Spencer*[3] are of the conventional type, the story of which they form a part is far from commonplace. The scene opens in a rural New England town early in the threatening agitation that preceded the war of 1812, and shifts with the events of the war to Canada, the Hudson, and points on our frontier where the opposing armies operated. In the course of the story, along with the pleasing or painful incidents affecting two sets of lovers, we are given several spirited interior views of representative homes in New England, and delineations of some of the most characteristic traits of its social, religious, and political life. As an essay toward the revival of the American historical novel it deserves to be received with favor, especially the portions descriptive of thrilling adventures by flood and field in which several of the principal characters take part, with peril to life or honor.

More florid in its coloring, more diffuse in its style, and venturing with a freer step into the domain of the doubtful or questionable than either of the preceding, *Roxy*[4] will be a favorite with that large class for whom the lily and violet have few attractions, and who lavish their admiration on flowers of more pretentious size and more gorgeous hue. Its sensuous descriptions of men and women—notably of women who by their splendid physical development are what the author himself terms "magnificent animals"—and the warm juxtapositions in which the sexes are sometimes thrown in his racy genre paintings of free and easy Western life, have a rich juiciness that is sure to tickle the unregenerate palate. The tale is affluent of genuine sensations, and the passions, emotions, and strifes which it chronicles with a free hand are of the same large proportions and showy complexions as its most prominent actors.

The author of *Cousin Polly's Gold Mine*[5] is a born story-teller, and delineates character with unwonted delicacy and firmness of touch. Her story, which is a transcript of simple rural life whose key-note is an affectionate and self-sacrificing loyalty to brotherly affection, revolves around four principal personages: two pure and true-hearted brothers, the one of quick parts and brilliant personal appearance, and the other neither clever nor well-favored; a sweet, gently nurtured, trustful, and loving New England girl, above the brothers in station, but whom both worship with their love—the one silently and afar off, as though she were a moon in some distant heaven, and the other with outspoken and successful ardor; and "Cousin Polly," bright, quick, and sharp as steel, whose nurture had been a hard and ungentle one, and by its maxims of parsimonious thrift and self-imposed toil had incrusted her with unmaidenly self-reliance and a hard selfishness. How the bright morning of happy successful love became obscured by misfortune till the sun of the favored brother sunk in darkness; how the other battled against and overcame disappointment and misfortune, growing stronger and nobler by the discipline of suffering endured with fortitude, and by the sacrifice of himself for the happiness of others; and how at the touch of innocent childhood there gushed from under the hard crust of Cousin Polly's rough exterior a long-pent fountain of womanly sweetness and love—all this is

told in this genial tale with graceful gayety or with tender pathos.

Taine's latest production, *The French Revolution*,[6] forms the second part of his series on "The Origins of Contemporary France," and resumes the relation of events at the point where it closed in the preceding volume, *The Ancient Régime*. The text of the volume under notice, as formulated by its author, is, "Popular insurrections and the laws of the Constituent Assembly end in destroying all government in France;" and the method which the author has pursued in the collation of evidence and the selection of authorities has been, as he informs us, to gather his materials almost exclusively from disinterested contemporaneous eye-witnesses of the facts, who wrote on the spot, at the moment, and under the dictation of the facts themselves, and whose evidence exists in the form of legal depositions, secret reports, confidential dispatches, private letters, and personal mementos. While this method has not the merit of novelty, it is a good one; and the author seems to have adhered to it in his relation of the events which occurred in France from the beginning of anarchy in the terrible winter of 1788–89 until the spring of 1792, when the people had become "a mob of mad brutes, under the leadership of insane and blood-thirsty blockheads." The relation of the appalling events that trod on each other's heels during this period is minute and graphic; and by his adhesion to the method of extracting his facts from the evidence of eye-witnesses the historian throws a flood of new light upon all that transpired, revealing alike the doings of the more gigantic architects of ruin, and of the microscopic vermin who undermined the foundations of social order. The work has many fine rhetorical passages, and numerous vigorous descriptions of prominent scenes and actors.

The final volume of D'Aubigné's *History of the Reformation in the Time of Calvin*[7] fitly closes his great work on *The Reformation in Europe*, and has a peculiar interest to English and American readers because of the large space it devotes to the progress of the Reformation in England under Henry VIII. D'Aubigné's description of England, and of the men and events which colored its history during this momentous period, is graphic and vigorous, but qualified by a temperate reserve. The volume also records the progress of the Reformation in Spain and Germany and their dependencies, and concludes with the death of Luther.

The recognized influence of books treating upon literature to refine the taste and discipline the judgment of the young should cause a hearty welcome to be extended to a good text-book of general ancient literature, adapted to use in high schools and academies. The want of such a book has been long felt, and is now met by Dr. Quackenbos's *Illustrated History of Ancient Literature*.[8] After an introduction in which the origin and relationship of languages are considered, and a brief summary is given of ancient literature without regard to national divisions, the volume falls under three parts: the first devoted to the ancient Oriental literatures, embracing the Hindoo, Persian, Chinese, Hebrew, Chaldean, Assyrian, Arabic, Phœnician, and Egyptian; the second to Grecian literature, comprising chapters on its birth, on epic and lyric poetry, on the rise of prose, on the Alexandrian period, and on the later Greek literature; and the third traces the history of Roman literature from its dawn and through its golden age to its decline. The book is noticeable for its careful condensation and the fullness of its topical and synoptical outline, and being unencumbered by obscure names or tedious details, is easy of comprehension and retention. The short, pregnant chapters on the Assyrian, Chaldean, and Egyptian literatures, with the examples given of each, must have the effect to awaken curiosity and fasten attention; and the brief biographies which are grafted on the narrative, of the great writers who created, moulded, or perfected the literature of their respective ages, accompanied as they are by short and characteristic specimens of their writings, will prove wholesome stimulants to youthful effort and emulation.

Professor Cruttwell's *History of Roman Literature*[9] is designed for general readers rather than as an exhaustive book of reference for professed scholars. Consisting of three divisions, the first treats upon the history of Roman literature from Livius Andronicus to Sulla, passing in review the earliest remains of the language, and presenting successively the history of the literature of oratory and philosophy, of historical and biographical composition, and of poetry and the drama. The second book covers the history of the Golden Age, subdivided into the "Republican Period" and the "Augustan Epoch," from the consulship of Cicero to the death of Augustus, and proceeds upon the same general methods of treatment as were pursued in the first, but more elaborately. Continuing the same methods, the third book gives the history of the literature of the Decline, from the accession of Tiberius to the death of Marcus Aurelius. Notwithstanding the rigid condensation that is observable, the author has avoided the baldness which usually accompanies great conciseness; and his biographical sketches and critical analyses and estimates of the prose writers and orators of the republican period and of the illustrious poets of the Augustan age are favorable specimens of the art of writing tersely yet elegantly.

Some circumstances connected with Archbishop Trench's publication of the series of lectures on Mediæval Church History,[10] delivered by him many years ago to a class of young ladies at Queen's College, seem to indicate his resolution to be his own literary executor; and this first-fruits of his determination will gratify a large

body of intelligent readers belonging to the Church in this country and England of which he is an ornament. In several introductory lectures he outlines the methods that should be observed in pursuing a study of church history, and defines the limitations severally of ancient, mediæval, and modern church history. He then discusses the history of the church, or more properly of Christianity as an organization, during the years which he ascribes to the mediæval period, beginning with the pontificate of Gregory the Great in 590, and closing with the opening of the Reformation in 1517. The lectures are arranged under three subdivisions: the first, covering the years from 590 to 1050, describes the Middle Ages in their formation; the second, from 1050 to 1303, shows us the Middle Ages at their height; and the third, from 1303 to 1517, exhibits them in their decline. Among the interesting topics specifically illustrated are the conversion of England and Germany, the composition of the Holy Roman Empire, and the revival of learning and Christian art.

The latest of the series forming the "Epochs of Ancient History" is a convenient little summary devoted to the history of early Rome,[11] in which its author traces the causes of the greatness of Rome, indicates the sources from whence a knowledge of its history is derived, examines what is credible and what apocryphal in its legendary period, and sketches its civil and religious institutions, its wars, leagues, and foreign relations during the regal supremacy and under the republic, and concludes with a spirited account of the invasion by the Gauls and of their expulsion by Camillus.

It is seldom in this country that one who is not a candidate for the Presidency is selected as a subject for biographical honors while he is yet in the flesh. Hon. A. H. Stephens, however, is an exception to the rule, and the exceptional office has been discharged in the work before us[12] with spirit by two personal friends, one of whom had unusual opportunities, during a close intimacy of over twenty-five years, to learn the minute particulars of Mr. Stephens's life, and whose memoranda of conversations have been largely re-enforced by an imaginary correspondence maintained between the two friends. The biographers have also had recourse to a large body of letters written by Mr. Stephens to his brother, in which he recorded nearly every event of his life, and the motives which influenced his actions. The work is generally well done, though trivial things are sometimes unduly magnified, and place has been given to much unnecessary and exasperating rubbish. The strictly biographical part is entertaining and instructive.

In many respects the most remarkable, and in a highly important field of scientific inquiry the most valuable, contribution of the year to our permanent American literature is the recently published volume of *Scientific Memoirs*,[13] by Dr. Draper. Collected from *Harper's Magazine* and from various journals, pamphlets, and transactions of learned societies, in which they originally appeared, these memoirs represent the fruits of forty years of patient investigation by one of the most eminent living philosophers, and embody the history of many original discoveries which have since been admitted into the accepted body of scientific knowledge. Having been allowed to remain substantially as when first written, the several memoirs form a series of waymarks along a laborious and successful lifetime, denoting the departure made, the intervals of progress accomplished, and the extent of the ground traversed; and thus, although the volume is far from being an autobiography in the usual sense, it is at once an authentic personal record of investigation and discovery in the realm of science, and a profoundly interesting autobiography of a successful discoverer while in the very act of his various experiments, and at the different stages of his great discoveries. To the American scholar these memoirs have special interest as the just and modest assertion of credit for work accomplished by an American philosopher, made with calm and dignified directness and great simplicity, and also as the unimpeachable record of the recognition of the high grade and value of that work by the scientific world. Reserving for the present several other memoirs on chemical, electrical, and physiological topics, Dr. Draper has included in this publication those only which relate to the operations, properties, phenomena, influences, and effects of light and heat, and which give the history of his discoveries connected with these all-pervading natural agencies.

Few books in the department of natural history are deserving of a more cordial welcome than Wilson's *Ornithology*;[14] and the edition of that engaging work, with Bonaparte's additions, now before us, merits the heartier reception for its generous proportions, its typographical excellence, and its adaptedness to popular needs by its comparative inexpensiveness. The three volumes composing the work are comprised in one large octavo of nearly twelve hundred pages, embellished by over six hundred illustrations of our native birds; and its value is enhanced by a well-written life of Wilson, a catalogue of North American birds by Professor Spencer F. Baird, an alphabetical index of genera of birds, and a copious general index.

It is seldom that the editorial function is exercised with greater discretion or a more judicious reserve than it has been by Mr. Rolfe in the preparation of his edition of *Hamlet*.[15] While it is free from the excessive criticism by which many of Shakspeare's editors have made a pedantic display of useless learning, it is full in every particular essential to an understanding of the play. In an introduction, after brief but sufficient historical sketches of the early editions of the tragedy and of the sources from whence its plot was derived, Mr. Rolfe brings together a number

[11] *Early Rome, from the Foundation of the City to its Destruction by the Gauls.* By W. Ihne, Ph.D. With a Map. 12mo, pp. 217. New York: Charles Scribner's Sons.

[12] *Life of Alexander H. Stephens.* By Richard Malcom Johnston and William Hand Browne. 8vo, pp. 619. Philadelphia: J. B. Lippincott and Co.

[13] *Scientific Memoirs.* Being Experimental Contributions to a Knowledge of Radiant Energy. By John William Draper, M.D., LL.D. 8vo, pp. 473. New York: Harper and Brothers.

[14] *American Ornithology; or, The Natural History of the Birds of the United States.* With Plates engraved from Drawings from Nature by Alexander Wilson and Charles Lucian Bonaparte. 3 vols., 8vo. Philadelphia: Porter and Coates.

[15] *Shakspeare's Tragedy of Hamlet, Prince of Denmark.* Edited, with Notes, by William J. Rolfe, A.M. With Engravings. 12mo, pp. 285. New York: Harper and Brothers.

of critical comments selected from the writings of Goethe, A. W. Schlegel, Coleridge, Thomas Campbell, Mrs. Jameson, and others, in which the structure of the play and its leading characters are carefully analyzed, while briefer remarks on special passages are to be found in the notes which are grouped under their appropriate scenes and acts at the close of the book. In these notes, nearly six thousand in number, and the fruit of industrious and intelligent research, a large mass of valuable material is unobtrusively stored, on matters historical, archæological, and philological; explanatory of difficult or ambiguous words, phrases, and passages; giving views of the various readings and parallelisms of Shakspeare; and illustrative of the manners, customs, and incidents referred to in the text.

A new volume of poems by Whittier is sure to merit and receive a friendly greeting. Always careful and conscientious in the execution of his work, "The Vision of Echard"[16] and its companion poems are conspicuous instances of this excellent virtue in a poet. The two principal poems in the volume are on strongly contrasted subjects, and their scenes are laid in as strongly contrasted lands. The first has for its theme a vision of God in a dream to the Benedictine monk Echard, as he sat "where Marsberg sees the bridal of the Moselle and Sarre," and relates the revelation of His will to the dreamer through the voice of a spirit, till the spoken word seemed to him "written on air and wave and sod," and "the bending walls of sapphire blazed with the thought of God." The other is a legend, in the ballad style of the "Witch of Wenham Lake," which describes how, for once at least, beauty and innocence escaped from the net-work of circumstance which superstition and malice had woven around them. The other poems are brief examples of Whittier's happiest powers.

The publication of the *Selected Poems of Matthew Arnold*[17] in the popular "Franklin Square Library" was evidently prompted by a generous estimate of the culture and intelligence of its readers, and the choice of the selections has been guided by a sound literary taste. The poems in the collection are specimens of Arnold's earliest and also of his most mature work, and while they afford the neophyte an excellent study of the methods of a polished artist, they will give pleasure to all lovers of the poetic art. As was to have been expected from a poet whose ideal standard of the Muse was that she is "young, gay, radiant, and adorned outside," but with "a hidden ground of thought and of austerity within," the distinguishing traits of Arnold's verse are the gracefulness of its form and the subtle intellectuality of its interior spirit. Notwithstanding, it is by no means barren of passages of great warmth and tenderness, though it rarely rises to the height of passion, and is never sensuously emotional. Those of his sonnets which are given, especially his later ones, are true brilliants, and his romantic poems are good specimens of legendary narrative poetry.

That poetry finds in the sister art its best and most congenial interpreter is exemplified on every page of two sumptuous volumes reproducing Cowper's *Task*[18] and Bryant's *Thanatopsis*.[19] Both are copiously adorned with illustrations of unusual excellence, in which each artist evinces that he has been a diligent and reverent student of the poet he interprets, and has caught his subtlest and most poetic meanings. The illustrations of *Thanatopsis*, by W. J. Linton, are finely imaginative; and those in *The Task*—the well-known ones by Birket Foster—are picturesque studies, in which nature in some of her loveliest moods is painted with realistic fidelity.

The Speaker's Commentary[20] was undertaken in 1863, at the instance of the Speaker of the House of Commons, with the object in view of supplying, through the co-operation of scholars eminent for Biblical learning, a plain explanatory Bible commentary, more complete and accurate than any that had been hitherto accessible. Under the general editorship of Canon Cook, of Exeter, the books of the Old Testament have been completed with great acceptability, and the installment of the work just published begins the New Testament with the three synoptical gospels. The Archbishop of York contributes to the volume an elaborate general introduction on the authenticity of the four gospels. The commentary and critical notes to St. Matthew were prepared by Dean Mansel (who died before the work was published), with the exception of those on the last two chapters, which were supplied by the editor, as were those also on St. Mark. Those on St. Luke were originally prepared by the Bishop of St. David's, but have been completed and revised by the editor. The work is a valuable contribution to theological literature, and meets the necessities alike of the professional scholar and the intelligent general reader.

The singleness with which Professor Shedd has confined himself, in the latest volume of his collected essays, to subjects bearing directly upon æsthetics and literature, fairly gives it the right to the distinctive title of *Literary Essays*.[21] A glance at their topics will show their adherence to purely literary subjects, and also reveal their general drift. Originally written at intervals from 1844 to 1859, they comprise elaborate discussions on the true nature of the beautiful and its relation to culture, on the influence and method of English studies, on the ethical theory of rhetoric and eloquence, on the relation of language and style to thought, on scientific and popular education, on intellectual temperance, on Coleridge as a philosopher and theologian, etc. Each of these essays may be read with pleasure for the lucidity of its style and the amplitude of its illustrations, and with profit for its accumulation of varied knowledge. We have, however, been specially impressed by those on the nature of the beautiful, on English studies and intellectual temperance, and on S. T. Coleridge. The last will be

[16] *The Vision of Echard, and other Poems.* By JOHN GREENLEAF WHITTIER. 12mo, pp. 131. Boston: Houghton, Osgood, and Co.

[17] *Selected Poems of Matthew Arnold.* "Franklin Square Library." 4to, pp. 32. New York: Harper and Brothers.

[18] *The Task.* A Poem. By WILLIAM COWPER. Illustrated by BIRKET FOSTER. 8vo, pp. 263. New York: Robert Carter and Brothers.

[19] *Thanatopsis.* By WILLIAM CULLEN BRYANT. Thin 8vo. New York: G. P. Putnam's Sons.

[20] *The Holy Bible, according to the Authorized Version, with an Explanatory and Critical Commentary, and a Revision of the Translation.* Edited by F. C. COOK, M.A., Canon of Exeter, etc. New Testament. Vol. I.: St. Matthew, St. Mark, St. Luke. 8vo, pp. 472. New York: Charles Scribner's Sons.

[21] *Literary Essays.* By WILLIAM G. T. SHEDD, D.D. 8vo, pp. 365. New York: Charles Scribner's Sons.

recognized as a republication of the scholarly analytical essay prefixed to Harper's edition of the poet's *Works*, published in 1852, and, it is to be hoped, may lead to a revived interest in his writings. The others are singularly suited to guide the taste of those who are preparing themselves for literary or professional pursuits.

The secret of the great acceptability of the *Sermons* of the Rev. Phillips Brooks[22] is not far to seek. Certainly it is not to be found in their bursts of oratory, or in their daring flights of imagination, nor in the seductiveness of their rhetorical embellishments; for although they are rich in varied eloquence and in sustained imaginative power of a high order, their dominant characteristics are unaffected naturalness, vigorous directness, and modest simplicity of style. The real secret of their power lies, however, less in any characteristics of style than in the fine sympathy and tender love which run through them and kindle a response in every heart. Mr. Brooks's methods are as simple as his style: almost uniformly he first resolves the absorbing issues with which he has to deal into their elementary principles, subjecting each to an exhaustive analysis, and then, after explaining and illustrating each by familiar examples drawn from nature or experience, he rebuilds them before the eyes of his auditors as examples for their warning or their imitation. In this process he touches every spiritual perplexity, and ministers encouragement or consolation or aid to every spiritual need. Rarely ever dealing dogmatically with a subject, his aim seems to be to sow the seeds of personal religion in the hearts of his hearers, and to nourish them there by his affectionate appeals and earnest reasonings till they bear fruit abundantly.

The reader of Dr. Dix's *Sermons*[23] will be insensibly impressed with the feeling that he is listening to a message carried to him by an accredited messenger. These sermons naturally fall under two classes—those which elaborate with clearness and brevity the high themes which lie at the foundation of Christianity, such as the mysteries of the Godhead and the incarnation, the office and attributes of the Holy Ghost, the efficacy of the Saviour's atonement, and the realities of heaven and hell and God as revealed in Holy Scripture; and those which relate to man, his accountability, his relationship to God and other men, the duties which he must perform, and the graces and virtues which are indispensable to spiritual growth. In this latter class the sermons on action, prayer and sorrow, on repentance, on growth in Christ, on rash and irreverent forms of belief, on the training of childhood, on sacrifice, submission, and affliction, and on the life battles in which all men must necessarily engage, are models of teaching at once authoritative and persuasive, and abound in tender and wise counsels for the furtherance of personal holiness among men. Dr. Dix's methods of illustration and modes of enforcing his message are peculiar to himself, and admirably adapted to conciliate the attention and assent of the sagacious and practical professional and business men of a great commercial centre. Apparently because he has felt that sentimental and rhetorical appeals would have no response from such as these, of whom his hearers are largely composed, he almost invariably addresses the conscience and the will through the understanding, and seeks to influence men to right belief and action by exhibiting the reasonableness, equitableness, natural fairness, and absolute consistency and justice of the religion which he preaches and the life which it requires men to lead. It is not to be inferred, however, that because of his employment of such wise and practical common-sense methods his sermons lack the higher elements, for while their exterior body is thus pre-eminently practical, their interior teachings and setting forth of truths are intensely spiritual. As has been intimated, Dr. Dix's methods of illustration are peculiar to himself, and it is interesting to observe wherein they differ from those employed by the two great preachers, Dean Goulburn and Rev. Phillips Brooks, whom he most resembles, by the importance ascribed to themes intended to aid men in the development and growth of personal holiness. He is less affluent than they in pleasing lessons and analogies drawn from natural objects, but far richer in those which are derived from the experiences of individual men, and the operations of their mental, moral, and physical nature.

The new edition of Dr. Hodge's text-book of the science of *Systematic Theology*[24] is not a bare reprint of the original *Outlines*, which appeared some eighteen years ago. Since then the work has been largely rewritten, so as to conform to the learned author's increased experience and to the advance made by modern scholarship. Several chapters have been dropped, and six new ones have been added, and it has been further enriched by extracts from the principal confessions, creeds, and theological writers of the great historical Churches. It has also been enlarged by an appendix containing two not easily accessible "confessions"—the "Consensus Tigurinus" of Calvin and the "Formula Consensus Helvetica" of Heidigger and Turretin. Notwithstanding its considerable enlargement, the work remains a model of condensation, and is an authentic version of the Princeton theology.

The appearance of a second edition of Mr. George C. Eggleston's *A Rebel's Recollections*,[25] originally written in 1874, indicates that its merits as a modest contribution to history from the Southern stand-point have had kindly recognition. To those who have not yet read it we can confidently say that its pictures of the mustering of the Confederate army, of the men who composed it, of the temper of the women of the South during the crisis of war, of the financial straits that were experienced and the financial expedients that were resorted to, and of Lee, Jackson, Stuart, and other of their military leaders, are very spirited, and without any tinge of bitterness.

A careful inspection of several of the little volumes forming "Harper's Half-hour Series" sug-

[22] *Sermons.* By the Rev. Phillips Brooks, Rector of Trinity Church, Boston. 12mo, pp. 371. New York: E. P. Dutton and Co.

[23] *Sermons, Doctrinal and Practical.* By Morgan Dix, S.T.D., Rector of Trinity Church, New York. 12mo, pp. 334. New York: E. P. Dutton and Co.

[24] *Outlines of Theology.* Rewritten and Enlarged. By Archibald Alexander Hodge, D.D. 8vo, pp. 678. New York: Robert Carter and Brothers.

[25] *A Rebel's Recollections.* By George Cary Eggleston. Second Edition. 12mo, pp. 260. New York: G. P. Putnam's Sons.

gests the reflection that whoever gives them the cold shoulder because of their diminutive size will suffer a great deprivation as the price of his mistaken prejudice. For example, here is one belonging to the series of English Literature Primers, in which we find a well-executed sketch of the *Classical Period of English Literature*, by EUGENE LAWRENCE, covering the years from the birth of Milton to the death of Gibbon, and giving condensed biographies of the great English poets, wits, philosophers, statesmen, dramatists, historians, and scholars who flourished in that period of intellectual activity, together with brief accounts and critical estimates of their principal productions, and references to interesting historical incidents connected with them and their times.—Here, again, is another, containing a reproduction of three of Macaulay's masterly biographical and critical essays, illustrating the lives and writings of Oliver Goldsmith, John Bunyan, and Madame D'Arblay.—Then, under the modest title, *A Primer of German Literature*, by HELEN S. CONANT, we have another which traces in flowing outline the growth of German literature, moving with rapid and graceful touches over the early period, and dwelling at greater length on the intellectual progress of the last two centuries. This later period is illustrated by compact and brilliant sketches of the most celebrated German thinkers, and by skillful epitomes of their greatest works. —In another, the inimitable Sir Roger de Coverley papers are rapt from their scattered isolation in the *Spectator*, and brought into continuous narrative form. They are also accompanied by a large body of interesting notes, throwing light on customs, events, celebrities, and institutions referred to in the text, on which the darkness of nearly two centuries had settled.—Still another is a timely contribution to the prevailing taste for ceramics, in the form of a *Hand-Book to the Practice of Pottery Painting*, in which are set forth with minuteness all that an amateur of the fictile art needs to know as to the choice, preparation, and grouping of colors, and as to the tools and materials required, and the methods of using them, together with the steps to be followed in the process of applying the pigments to the different kinds of pottery.—And finally, to complete the variety, the last of these unpretending volumes, *Behind Blue Glasses*, is a sprightly novelette from the German of F. W. HACKLANDER, written in the genuine light comedy vein, and sparkling with humorous incidents and mirth-provoking dilemmas.

A budget of books in gay bindings, and printed on delicately tinted paper, pleasantly reminds us that while the publishers are busy catering for the tastes of grown-up folk they are not forgetful of the children. Two of these, *Aunt Sophy's Boys and Girls*, and *Little Neighbors* (E. P. Dutton and Co.), intended for children of six or eight, are large and elegant volumes, written in the true story-telling style, and noteworthy for the abundance and quality of their etchings and engravings of subjects attractive to the little people. Two others, *Prairie Days; or, the Girls and Boys of Osego*, and *My Boyhood*, from the same publishers, are designed for children from ten to fourteen. The one last named is distinctively a boy's book, and what it has to tell is exactly suited to the tastes of energetic and wide-awake boyhood. Another book in which young folk will find capital entertainment is the story of *Nelly's Silver Mine*, by H. H. (Roberts Brothers), which starts with a picture of a Christmas morning in a snug New England home, and a recital of the delights which that best of days brought to Nelly and her brother, and then transplants us to distant Colorado and its stupendous scenery. Its descriptions of the cañons and mountains, the mines and miners, and of the life that is lived in that outpost of our country, are so vivid and precise as to fire the fancy and instruct the mind of the young reader.

Editor's Scientific Record.

Astronomy.—Dr. Peters discovered his twenty-ninth and thirtieth minor planets (Nos. 188 and 189) on July 7 and September 17. Professor Watson is not too much engaged in his work on a new major planet to add occasionally an asteroid to our system. His twenty-third planet, No. 190, was discovered September 20. Swift's comet of July 7 was observed well by Dr. Peters, and is possibly the same as one announced by P. Ferrari, of Rome, as having been discovered in July. No news of this came to this country by telegraph, but it was only heard of by a telegram in the London *Times*. With regard to Vulcan, the following deductions appear not to have been noticed: 1. Leverrier's orbits were said by himself only to be possible if the inclination of Vulcan was large—say 12° or over; 2. Watson's observation fits one of Leverrier's orbits, as shown by Gaillot, but necessitates a small inclination—say 6° or thereabouts; 3. If, then, Watson's eclipse Vulcan and Leverrier's transit Vulcan are one and the same, this new planet must be on the face of the sun several times a year; but it has never been seen on the thousands of photographs, drawings, etc. Thus the ephemeris of Gaillot is meaningless.

In a recent article in the *Nineteenth Century*, by Mr. Lockyer, the writer very strongly questions Dr. Henry Draper's discovery of oxygen in the sun. Mr. Lockyer says he has gone carefully over the whole ground, and finds (1) that the photograph on which Dr. Draper bases the discovery is not one competent to settle such an important question; (2) that he does not find the coincidences between bright solar lines and oxygen lines in the part of the spectrum with which he is most familiar; and (3) that, comparing Dr. Draper's photograph with the fine photograph of the spectrum obtained by Mr. Rutherford, he "fails to find any true bright line in the sun whatever coincident with any line of oxygen whatever." Recent observations at Greenwich, by Mr. Christie, and by Dr. John C. Draper, of the city of New York, have led to a similar conclusion, and the whole subject, so far as the opinions of scientific men are concerned, may be said to be in an unsettled state. Dr. Draper continues to work on this question, and if a different expla-

nation of his remarkable photographs is to be found, his own researches will undoubtedly disclose it. At present the question stands in this way: Dr. Draper, using an apparatus definitely described, obtains certain regular coincidences between the bright lines of oxygen in the air and bright spaces in the solar spectrum. These have been photographed hundreds of times, with many conditions varying. His explanation of these is doubted by many eminent spectroscopists, and received by many others. In the mean time no other satisfactory explanation has been advanced.

Dr. Ball, of Dublin Observatory, has made a series of observations on the parallax of 61 *Cygni*, using a different comparison star from Brünnow's. The result is, $\pi=0.4654'' \pm 0.0497''$. For reference the following older results may be added: Bessel (1st), $\pi=0.357''$; Johnson (1st), $0.526''$; Struve, $0.511''$; Auwers, $0.564''$; Peters, $0.349''$. Dr. Ball has also made a working list of forty-two stars which *a priori* seemed likely to be near our system, and has examined these stars at critical times of their ellipse of parallactic displacement. In no case was a large parallax ($\pi>1''$) indicated. In this connection it may be mentioned that two stars are waiting for observers—one mentioned by Fearnley in the *Ast. Nach.*, and another by Vogel in his *Sternhaufen χ Persei*, 1877, 4to.

The death of Emil von Asten at Kiel on August 15 will be a great loss to "computing astronomy," as it may be long before another can be found to continue the re-investigation of the motion of Encke's comet, with which Von Asten's name is associated. His other memoirs are on the mass of Uranus, on the temperature of St. Petersburg, and on various metaphysical subjects.

Among the important reports of the British Association for the Advancement of Science is Glaisher's on mathematical tables. He has undertaken the calculation of the factor tables of the fourth, fifth, and sixth millions on the plan of Burckhardt's and Dase's. These tables give the least factor of every number not divisible by 2, 3, or 5, and the series will, when completed, comprise 1 to 3,000,000 (Burckhardt), 3,000,000 to 6,000,000 (Glaisher), 6,000,000 to 10,000,000 (Dase). Mr. Glaisher is now printing the first third of his work.

From *Nature* we have an account of the new work of Dr. Schmidt, of Athens, on the moon, and his lunar map. The personal history of Schmidt's long-continued labors is especially interesting. In 1839 he first began to examine the lunar surface, and made frequent studies, measures, and drawings up to 1867. At this time, being director of the Athens Observatory, he commenced his final map, which is now published, on a scale of six feet to the moon's diameter. This was finished in 1874, and is in twenty-five sections. With Lohrmann's and Beer and Mädler's maps it will make the surface of the moon better known than many parts of the civilized globe, and will serve as an invaluable witness in any future questions as to secular changes in the lunar surface.

Otto von Struve is now making a tour of inspection of observatories in Europe, for the purpose of deciding on the plan and construction of a new large refractor for Pulkova.

Meteorology.—In our meteorological review for September we note, first, the publication by the Hydrographic Office of the United States Navy of an imposing volume of charts giving information regarding winds, calms, fogs, rain squalls, weather, barometer, temperature of the air, of sea water, and of evaporation—all for every five degrees square, and for each month. This volume is the first of the series, and covers the Pacific Ocean between the equator and the 45th parallel of north latitude, and between the American coast and the 180th meridian. The next volume, for the north and south Atlantic Ocean, is well advanced, and the whole series, when finished, will cover the whole navigated ocean surface of the globe. This important work was begun in September, 1876, by Lieutenant T. A. Lyons and other officers of the United States navy, and will by them be continued until completed. The data are supplied by log-books of the United States vessels of war, and the journals kept by merchant vessels on forms supplied by the Hydrographic Office.

The regular Monthly Weather Reviews for August, coming to hand, as usual, about the 10th of the following month, contain many additional items relating to the remarkable local storms of that month. The Canada review devotes a short postscript to the tornado and terrible hail-storm which passed over Norwood and near Toronto on August 8; hail-stones weighing one and a half pounds were caught and measured. The average weight of a large number was half a pound. The larger ones averaged one to every yard, the smaller ones one to every inch. The review for the State of Iowa, by G. Heinrichs, gives maps showing the rain-fall during thirty storms, and illustrating the definite regular gradation of rain-fall from the centre of a storm outward. The Signal Service Review for August has an especially interesting abstract of a report, by Professor W. H. Brewer, on the tornado at Wallingford, Connecticut, on the 9th; it also gives a remarkably long list of tornadoes and local storms during the month. At the close of this review there is given a list of Signal Service stations at which the duration of the total eclipse was observed. As showing the extensive correspondence of this office, it may be added that 295 stations are stated to have sent in reports concerning this eclipse.

The reduction of observations of earth temperatures at various stations in Russia, and a general discussion of similar observations elsewhere, form the subject of the latest publication by Wild—the hourly variation of temperature under the surface of the earth is elucidated by him for the first time. The only collection and comparison of similar observations that we happen to know of were made by Abbe in working up the data relative to the hatching of grasshopper eggs, as published in the recent report of the United States Entomological Commission. Wild's paper is of pre-eminent thoroughness and ability, and must form a starting-point for many new investigations into this important subject.

The separation of meteorology from the National Observatory at Paris has been officially consummated, and the new "Central Meteorological Bureau," with Mascart at its head, has been created under the Minister of Public Instruction. The bureau is charged with all studies and applications of meteorology.

In *Physics*, Jevons has continued his researches on Pedesis, the name which he has given to the

well-known Brownian movement of microscopic particles. To decide between the hypothesis that this movement is due to surface tension, as some hold, and the one which ascribes it to chemical or electromotive action, held by the author, Jevons made the experiment in a solution of soap. Since soap lessens the surface tension of water without affecting its conductive power, the pedesis, if due to surface tension, should be lessened by it. The reverse, however, proved to be the fact, the pedetic motion becoming considerably more marked on the addition of soap, even when not only china clay, but also ferric oxide, chalk, and barium carbonate were employed. The author believes from his experiments that the detergent action of soap is due to pedesis, by which minute particles are loosened and diffused through the water, so as to be readily carried off. The high cleansing power of rain or distilled water, in contrast with that of impure hard water, is due to the fact that the electric conductivity of the former is lower, and hence pedesis is higher. The addition of salts to water increases its conductivity but diminishes its pedetic and detergent power. If the salts be alkaline, the pedetic power is lessened, but the water acts on oleaginous matter. But if soap be also added, we have the advantage of both the alkali dissolving power and of the pedetic cleansing power.

Rayleigh has discussed, in a lecture delivered before the Royal Institution, the theory of maintained vibrations in acoustics, confining himself to that class of such vibrations of which heat is the motive power, and particularly to the case where the vibrating body is a mass of air more or less completely confined. The most common form of the phenomenon is that often observed in blowing a bulb on a glass tube, first investigated by Sondhauss, though the more familiar examples of the hydrogen singing flame and the tube of Rijke are also cases in point. The explanation seems to be that the heat is communicated periodically to the mass of air confined in the sounding tube at a place where in the course of a vibration the pressure varies. The phenomena, however, are yet quite complex.

Carnelley, having determined by careful calorimetrical experiments the fusing-points of various salts, has, in conjunction with Williams, made use of the data thus obtained for the purpose of determining the boiling-points of substances which are beyond the range of ordinary thermometers. Fragments of two or three salts are placed in the vapor or liquid, and examined to see if they melt. Thus, for example, while sodium chlorate melts in the vapor of mercuric chloride, sodium nitrate does not. Anthracene vapor melts potassium nitrate, but not the chlorate; its boiling-point is between 339° and 359°. The authors hope to fix in this way the boiling-points of potassium, sodium, etc.

Hofmann has devised a new form of camera lucida, which seems to be an improvement upon the ordinary instrument. In place of a total reflection prism he uses two mirrors, one metallized, the other plain, placed at a fixed angle. The latter mirror transmits the rays coming from the pencil, and at the same time reflects a part of the rays coming from the object to be drawn, and which have already been reflected from the metallized mirror. A neutral tint glass or a set of lenses may be attached to the apparatus for special kinds of work.

Thompson has described a rainbow phenomenon, seen chiefly in Switzerland, in which radial streaks of light devoid of color are observed within the primary and without the secondary bow. He explains it by supposing that the wedge-shaped radial streaks are beams of sunlight, which become visible by diffuse reflection from particles of matter in their path, just as the apparently divergent beams of sunrise or sunset become visible. Being practically parallel, they appear to converge in the point exactly opposite to the sun by perspective, just as the parallel beams of the sun appear divergent. Since the rainbow has for its centre the point opposite to the sun, such beams must have positions radial with respect to the bow. They have never been observed crossing the dark span between the primary and secondary bows. The phenomenon is a frequent one in Wyoming Territory.

Stoney and Reynolds have studied the peculiar absorption spectrum of the vapor of chlorochromic oxide, which is of special interest because it supplies information as to the duration and character of the motion of the molecules of the vapor which produces it. The spectrum consists of lines of various intensities, but uniformly distributed. Of these 105 have been examined, and from their position it has been ascertained that they are all to be referred to one motion in the molecules of the gas, of which motion they are all harmonics or quasi-harmonics. On the first supposition this motion is repeated 810,000,000,000 times every second in each molecule. From the succession of intensities it is surmised that this motion is in some way related to that of a particular point in a violin string vibrating under the influence of the bow, *i. e.*, a point nearly but not quite two-fifths of the string from one of the ends.

Hurion has examined in the laboratory of Mascart the spectrum of iodine vapor, and shows that, as Le Roux had observed, this spectrum is produced by anomalous dispersion, the blue, contrary to the usual order, being less deviated than the red. Using a hollow prism of glass, placed inside a hot-air bath, the author has successfully measured the refractive indices for the blue and red rays, and finds them as follows: for the blue 1.019, and for the red 1.0205. This gives 0.06 for the negative dispersion of iodine vapor, which is very near the positive dispersion of flint-glass. Assuming that the refractive power of a substance is independent of its physical state, the calculated indices for solid iodine would be for the red 1.89, and for the blue 1.83, the values obtained from measurements of the refractive power of a solution of iodine in carbon disulphide being 2.07 and 1.98 respectively.

Gaugain has recorded the curious fact that a bar of steel magnetized at 400° or 500° C. not only loses it magnetism gradually as it is cooled until it becomes zero, but that then magnetism of contrary sign appears, and increases until the bar reaches the temperature of the air, never becoming, however, as intense as the original magnetism. On again heating it the same effects are produced in the inverse order, and they may be reproduced many times without remagnetizing. To account for this result the author proposed the hypothesis that the bars which presented the phenomena consisted of two layers of magnetism of contrary name, which were differently modified by the variations in the temperature of the bars.

To test the question experiments were made with a steel tube inclosing a steel rod, forming a magnetic system. If the tube be magnetized, the rod inserted, and then withdrawn, the latter is found magnetized like the tube. But if, before withdrawing the rod, the system be heated to 300° and allowed to cool, the tube has lost nearly the whole of its magnetism, and the rod has become oppositely magnetized. The same results are obtained if the rod be magnetized in place of the tube. Moreover, if both tube and rod be magnetized at the ordinary temperature, or at 300° to 400°, and be at once separated, they are magnetized alike. But if the system be cooled before withdrawing the rod, their magnetism is opposite. If the magnetization has been effected at 300° to 400°, reheating the system increases the direct magnetism of the nucleus, and at the same time diminishes the inverse magnetism of the tube.

Gaiffe has contrived two simple forms of galvanometer, one for measuring electromotive force directly, and the other for measuring current strength. In the former the coil has a high resistance (about 3000 units of the British Association committee), so that the resistance of the rheometer may be neglected in comparison, and the deflections of the needle be sensibly proportional to the electromotive forces. By means of two additional resistance coils the resistance may be increased ten and fifty times. The circle is graduated empirically into sixty divisions, each of which represents one-tenth of a volt when the galvanometer resistance alone is used. Electromotive forces from 0.1 to 150 volts may thus be measured. The latter galvanometer has a coil of low resistance, with shunts by which its delicacy may be still further reduced. Using the galvanometer alone, one division on the scale represents one-ten-thousandth of a B. A. unit. With the first shunt the divisions represent hundredths, and with the second whole units. Current strengths from 0.0001 to 200 units may thus be measured. These instruments are accurate to one per cent., sufficient for testing currents used in medicine, for which they were devised.

Sabine has investigated the remarkable motions which are produced by placing a drop of very dilute acid upon the clean surface of a newly filtered and rather rich amalgam of some metal which is positive to mercury. The drop does not lie still, as it would do on pure mercury, but sets itself into an irregular jerky motion. This is true of copper, tin, antimony, zinc, and lead amalgams. If, however, amalgams of metals negative to mercury be used, such as gold, platinum, and silver, the drop lies quite still. Sulphuric, hydrochloric, oxalic, and acetic acids were used, and all produced the result, but in different degrees. In oxygen the movements are increased; in hydrogen they are arrested. The author hence infers that the motions result from alternate deoxidation of the mercury beneath the acid by electrolysis, causing the drop to contract by an altered surface tension, and reoxidation outside of the drop, causing it to expand again over the surface.

In *Chemistry*, Muntz has made a research upon the formation of alcohol in the cells of growing plants, and finds that, when confined in an atmosphere of nitrogen or any gas not containing oxygen, the presence of alcohol can be invariably detected, even after only a few hours' exposure, while none appeared in other similar plants not thus treated. The experiments were made with beets, maize, geranium, cabbage, etc., and the results are regarded as confirming the views of Pasteur, that the alcoholic fermentation produced by ordinary yeast is simply an exaggeration of the normal action of all organic cells in the absence of oxygen.

Wilson has presented to the British Association a paper on the amount of sugar contained in the nectar of various flowers. A single flower of fuchsia contains 7.59 milligrams, of which 1.69 is fruit sugar and 5.9 cane sugar. A flower of everlasting pea has 9.93 milligrams, 8.33 being fruit and 1.60 cane; a raceme of vetch 3.16 milligrams, 3.15 being fruit sugar, a single flower giving 0.158 milligrams of fruit sugar. A head of red clover gave 7.93 milligrams, 5.95 being fruit and 1.98 cane, each floret giving 0.132 milligrams, 0.099 being fruit sugar; a flower of monk's-hood 6.41 milligrams, 4.63 being fruit sugar. Approximately, then, 100 heads of clover give 0.8 gram of sugar, or 125 give a gram, and 125,000 a kilogram. As each head contains about 60 florets, it is evident that to obtain a kilogram of sugar 7,500,000 florets are required. Now as honey contains about 75 per cent. of sugar, 5,600,000 flowers would yield a kilogram of honey, or say two and a half millions a pound. Since this nectar is only of use to the flower by attracting insects to it, and in this way fertilizing the plant, as is evident from the fact that it is secreted at the time only when the visits of insects would be beneficial—*i. e.*, when the anthers are shedding their pollen—it is interesting to notice the connection now pointed out between the amount of nectar a flower secretes and the results of insect visits in changing the size, shape, color, etc., of the flower.

Zoology.—An interesting essay, by V. Sterki, on the infusoria, especially *Oxytricha* and its allies, will serve to keep up the interest in these organisms. Siebold and Kölliker's *Zeitschrift* also contains the fifth paper on the anatomy and development of sponges, by Professor F. E. Schulze, the present essay describing and figuring the metamorphosis of *Sycandra raphanus*.

Additional essays by H. Ludwig on the finer anatomy of the sand-stars and brisinga—a deep-sea, many-armed star-fish, found in deep water off the coast of Norway and in the abysses of the North Atlantic—will interest the special student.

The brachiopoda dredged in the North Atlantic in 1868–70, on the expeditions of H.M.S. *Lightning* and *Porcupine*, are being fully described and figured by J. Gwyn Jeffreys in the Proceedings of the Zoological Society of London. Particular attention is given to the vertical distribution and the geological range of these shelled worms, regarded still as mollusca by the author.

A writer in the *American Naturalist* for October notices the curious fact that at a point near White House Landing, Virginia, on the Pamunky River, where fresh-water mussels (*Unio*) abound, it has been found impossible to raise ducks, for the reason that at low water the ducklings were liable to be caught by the mussels and held until drowned by the rising tide. This story, Mr. Mather adds, was afterward confirmed by the Pamunky Indians, who live on an island below White House, and who, with every facility for raising large quantities of ducks, do not keep them.

A synopsis by Mr. E. B. Wilson of the *Pycnogonida* of New England, or spider-like insects, which live from low-water mark to a depth of fifty or a hundred fathoms in the sea, appears in the Transactions of the Connecticut Academy of Arts and Sciences. Each species is illustrated, and this neglected though interesting group receives good treatment at the hands of the author.

The attention of critics has been lately given to a statement of Fritz Müller, of Brazil, an eminent German naturalist, as to whether a prawn (*Penæus*) is really an exception to all other shrimps, etc. (*Decapods*), and has young of the *nauplius* form instead of the *zoëa* form, the nauplius being an oval six-legged larva, and forming the early stage of the entomostracous crustacea, such as the water-fleas (*Cyclops*). The supposed fact that *Penæus* was born in the nauplius stage of existence was supposed to be a strong fact for the truth of the evolution theory. Recently Mr. C. Spence Bate has questioned whether *Penæus* has a larval form like a nauplius, and demands from Müller proof of his assertion, the latter having admitted that his evidence was of a circumstantial nature. Mr. Bate remarks that "after fully considering the subject, it appears to me that Fritz Müller's nauplius may be the larval condition of a schizopod, more or less related to *Euphausia*, or it may be the young of one of the suctorian parasites, but that there is every reason to believe that it is not the young of any known prawn, and there is no evidence to determine its relation to *Penæus*."

The causes of the humming of insects have been studied by Pérez, who finds that among *Hymenoptera* and *Diptera* humming is due to two distinct causes—one, the vibrations of which the articulation of the wing is the seat, and which constitute the true hum; the other, the friction of the wings against the air—an effect which more or less modifies the former. Among the powerful-winged *Lepidoptera*, such as the sphinxes, the sweet and mellow hum of these insects is due only to the rustling of the wings by the air. This sound, always grave, is the only one produced; it is not accompanied by basilary beatings, on account of a peculiar organization, and especially from the presence of scales. In *Libellula*, the dragon-fly, the base of whose wings is provided with soft and fleshy parts, there does not exist true humming, but a simple noise due to the rustling of the organs of flight.

A swarm of locusts (*Acridium peregrinum*) is reported in *Psyche* to have boarded the ship *Harrisburg*, of Boston, on the passage from Bordeaux, bound to New Orleans, on the 2d day of November, 1865, in latitude 25° 28′ north, longitude 41° 33′ west, making the nearest point of land 1200 miles off. They came on board in a heavy rainsquall, the clouds and ship's sails being full of them for two days, as certified to by E. G. Wiswell, master of the vessel. This species appeared in Corfu, in Spain, and even in England. The Corfu swarm, adds Mr. Scudder, was composed of the variety with yellow-colored hind-wings, and therefore came from Northern Africa, where that form is found, while the Spanish and English swarms were of the rose-colored variety, and must have originated in Senegal. "But the most interesting point of all is the fact, first pointed out by Stol, that all the other species of that group of the genus to which this species belongs are American; whence it is highly probable that *A. peregrinum* also is indigenous to America, from whence it has been recorded. Its occurrence in mid-ocean in such numbers is a clear indication that it originally flew from one continent to the other in sufficient numbers to establish itself in a new home."

The distribution of the Rocky Mountain locust has been this season observed by Dr. A. S. Packard, Jun., the secretary of the United States Entomological Commission, in Colorado, Wyoming, Utah, and Idaho. It was only locally injurious in Northeastern Utah, and though abundant in Idaho north of and about Franklin, the commission feel authorized to state that there will be no general invasion of the Western States and Territories in 1879, though it was found by Messrs. Thomas and Packard to be spread in small numbers in the parks and plains as well as mountains of Colorado, and to occur in very small numbers in Western Nebraska, Wyoming, and Montana. Portions of Northern Utah and Montana are annually afflicted by them. The results of investigations this year confirm the views stated by the Commissioners in their report issued in July last.

The maple-tree bark louse, occasionally destructive to the maple, has been studied with care by Miss Emily A. Smith, an illustrated account appearing in the *American Naturalist*.

A case of mimetic coloring in tadpoles is recorded by Sarah P. Monks in the *American Naturalist* for October. She finds that the tails of the tadpoles resemble the submerged lower leaves of a plant, *Ludovidgia palustris*, in color, width, and shape. The resemblance in color was so striking that a friend, who was not on the lookout for analogies, mistook a leaf for a tadpole.

In a communication to the British Association for the Advancement of Science on the saurians of the Dakota cretaceous rocks of Colorado, Professor Cope drew attention to the habits of those dinosaurians, so remarkable for their thin-walled dorsal and cervical vertebræ. He was of the opinion that the caverns were not filled with cartilage, but with diverticula from the lungs or other air cavities. He advanced the theory that the species of *Camarasaurus* and *Amphicœlias* were dwellers in water, sometimes of considerable depth, where they walked on the bottom and browsed on the algæ, and sometimes land plants growing on the shore. The long fore-limbs and long neck of *Camarasaurus* were further evidence that the animal reached upward for food, as the giraffe, or for air when submerged.

Engineering and Mechanics.—As supplementary to our late reference to the government survey for the Delaware and Maryland Ship-Canal, we may report the following suggestions as to available routes therefor, which it is affirmed will receive the attention of the engineers in charge of the work. One route proposes to make use of the Choptank River (which enters the Chesapeake Bay below Cambridge, about fifty miles from Baltimore) as a part of the canal as far as Indian Creek, thence running directly across to the northwest fork of the Nanticoke, and thence in a direct line to Broadkiln Creek, about three miles above the Delaware Breakwater. The length of this route is estimated at about forty miles. Another route starts from the St. Michael River, at Royal Oak, forty miles from Baltimore, thence to the Choptank at a point above Lord's Landing,

thence to Cabin Creek, and thence to the Broadkiln on the Delaware Bay. Another route is from the Sassafras River, thirty-five miles from Baltimore, across to Deep-water Point, making use of Blackbird Creek, the distance across which is about thirty miles. The route which appears to meet with most favor, however, is that using the Chester River from Baltimore to Queenstown (twenty-eight miles), and thence directly to the Broadkiln—a distance of fifty-five miles. The advantages of a canal connecting the two bays for the commerce of the cities of Baltimore, Philadelphia, and New York have already been pointed out, and we need only add to what has already been said the statement that at the last session of the Maryland Legislature the city of Baltimore was authorized to aid the canal to the extent of $500,000.

Referring to the natural gas wells of East Liverpool, Ohio, which appear to be largely utilized, a correspondent of the Cleveland *Leader* states that they supply the light and heat for the town almost exclusively. The city is lighted with it, and the street lamps are left burning continually, day and night, as the gas costs nothing, and it is therefore not worth the trouble to extinguish it. It is conducted into the grates and stoves of private houses for heating and cooking purposes, and furnishes steam-power for many of the largest pottery and iron-stone china establishments there located. As to the duration of the supply, it is affirmed that "the first well discovered now burns as brightly as when first opened, and for the last twenty years has never flagged in brilliancy, while none of those now in operation have ever shown any signs of giving out."

Editor's Historical Record.

POLITICAL.

OUR Record is closed on the 24th of October.—State elections were held October 8 in Ohio, Indiana, Iowa, and West Virginia. In Ohio the plurality for Milton Barnes, the Republican candidate for Secretary of State, was 3498. As compared with the vote in 1877, both the Republican and the National vote showed large gains—the former of 25,000 and the latter of 9000, while the Democratic vote showed a loss of 659. In Iowa the Republican majority for Secretary of State was about 15,000. In Indiana and West Virginia the Democrats had majorities; in the former State 10,000, and in the latter 5000.

The New Hampshire Prohibitionist Convention, at Nashua, October 15, nominated Asa S. Kendall for Governor. The Delaware Greenback Convention, at Wilmington, October 17, nominated Dr. K. J. Stewart for Governor.

The new Canadian ministry is thus constituted: Premier and Minister of the Interior, Sir John A. Macdonald; Minister of Public Works, Hon. Charles Tupper; Minister of Finance, Hon. S. L. Tilley; Minister of Agriculture, Hon. J. H. Pope; President of the Council, Hon. John O'Connor; Minister of Justice, Hon. James Macdonald; Minister of Militia, Hon. L. F. R. Masson; Postmaster-General, Hon. H. L. Langevin; Minister of Marine and Fisheries, Hon. J. C. Pope; Minister of Customs, Hon. Mackenzie Bowell; Secretary of State, Hon. J. C. Aikens; Receiver-General, Hon. Alexander Campbell; Minister of Inland Revenue, Hon. L. F. G. Baby.

The Eastern question again offers threatening aspects. The Czar of Russia has sent a letter to the powers asking them to unite in compelling Turkey to execute her share of the Treaty of Berlin, setting forth in detail the points in which the Porte has failed to fulfill its engagements as specified in that treaty. It intimates, also, that the Treaty of Berlin was only explanatory of and a supplement to the Treaty of San Stefano, and that both must be read together. This letter, taken in connection with the recent threatening attitude of Russia toward Turkey, and her unpleasant relations with England in Asia, is deemed to be a step toward re-opening the questions that were considered as settled at Berlin.

A dispatch from Simla to Reuter's Telegraph Company confirms the report that the Ameer's reply to the Viceroy of India is unconciliatory and unsatisfactory. The *Daily News's* dispatch from Simla gives the following as the substance of the Ameer's message: "You may do your worst, and the issue is in God's hands."

The German Reichstag, October 19, adopted the entire Socialist Bill, as amended, by a vote of 221 to 149. The operation of the bill is limited to a period of two and one-half years.

The City of Glasgow Bank, Scotland, closed its doors October 2, with liabilities stated to amount to $50,000,000. Frauds have been discovered in its management, for which its officers have been arraigned.

DISASTERS.

October 8.—An excursion train on the Old Colony Railway, returning to Boston from a boat-race, was wrecked by an open switch, in the town of Quincy, near Boston. Of the 1500 passengers twenty-one were killed outright and over 150 were injured.

October 16.—During a panic in the Baptist church at Lynchburg, Virginia, nine colored people were killed and thirty wounded.

October 11.—Panic in the Colosseum Theatre, Liverpool, England. Thirty-seven persons killed.

October 20.—Railway collision in Wales. Twelve persons killed and over twenty seriously wounded.

OBITUARY.

October 6.—In Boston, Massachusetts, the Rev. Nehemiah Adams, D.D., author of *A South Side View of Slavery*, in his seventy-third year.

October 19.—In Baltimore, Maryland, Benjamin H. Latrobe, the eminent civil engineer, aged seventy-one years.

October 20.—At Huntington, Long Island, Rear-Admiral Hiram Paulding, of the United States navy, aged eighty-one years.

September 27.—At Gotha, in Saxe-Coburg-Gotha, Dr. August Heinrich Petermann, the eminent geographer, aged fifty-six years.

October 12.—In France, Felix-Antoine-Philibert Dupanloup, the celebrated Roman Catholic Bishop of Orleans, aged seventy-six years.

Editor's Drawer.

FROM the recently published biography of Alexander H. Stephens we cull the following anecdote:

"While on the subject of old Georgia schoolmasters, our readers will perhaps forgive us if we mention another, though he has no immediate connection with our narrative. His name was Duffie, and he swayed the rod in an adjoining county. He was a preacher as well as teacher, and in the latter character he wielded the hickory and took his dram in all respects like the rest of his brethren. He was a great politician, and took a lively interest in all the local affairs of the county. One Friday afternoon, when there was to be next day a horse-race at the county town, one of the competitors in which was one of his political leaders, he admonished his boys in the following fashion:

"'Boys, I suppose you know that there's going to be a horse-race in town to-morrow. Now, boys, don't you go to it. But, boys, if you do go, don't you bet; whatever you do, don't you bet. But, boys, if you *do* bet—mind what I tell you: if you *do* bet, be sure to bet on Abercrombie's mare!'"

"WHEN I travel by rail," said an eminent divine at an English station, the other day, "I select a first-class carriage in the middle of the train, I enter the middle compartment of that carriage, and I take the middle seat in that compartment—*in medio tutissimus ibis*—and I leave the rest to Providence."

"It strikes me he leaves precious little to Providence," said an eminent descendant of Mr. Toodles, *sotto voce*, who was standing by.

DURING the early part of the rebellion the majority of the Committee on Army Supplies of the House of Representatives reported in favor of granting supplies, while a strong minority report opposing the grant was presented by Mr. Vallandigham. After the reading of the minority report, Mr. Thaddeus Stevens inquired of Mr. V. whether his report was *signed* by all the opposing members of the committee. Mr. V. replied, testily, "Yes, Sir, and not one of them has made his mark."

"And never will," retorted Stevens.

WHEN Kentucky had among its Congressional delegation a Marshall, somewhat distinguished for his pomposity if not for his ability, Mr. Thaddeus Stevens, in the course of debate, referred to the "distinguished gentleman from Kentucky;" whereupon Marshall, rising in his place, interrupted Mr. Stevens with the question, "Does the gentleman refer to me?"

"No, Sir," replied Stevens; "whenever I speak of the distinguished gentleman from Kentucky I always mean Mr. Crittenden."

Galloway Gossip is the title of a modest volume containing a series of articles illustrative of the manners, customs, and peculiarities of the aboriginal Picts of Galloway, for which we are indebted to the courtesy of the editor. Our clerical readers, we are sure, will enjoy the following:

"Young Cuddie Lauchison, or M'Lauchlan at the Isle, was a New Licht elder down about Whithern, and a powerful hand at a prayer, and he could give no bad a discoorse by a time, when there was occasion. The minister took a notion of a new-fangled kind o' religion they ca't a Sunday-school; and Cuthbert, as a forbye righteous man, took a great hand in't, and imagined it would make all the lads and lasses into saints, and banish every kind of wickedness out o' the parish. One Sunday they were giving out prizes for the best attendance, and Cuddie, as the minister was absent, improved the occasion by giving a discoorse on Sunday-schools. 'Ay!' says he, 'this parish is joost like the city o' Jericho; it's hotchin' wi' sinners; an' oor minister's like Joshua the prophet mairchin' roon aboot it wi' the ram's horns, an' blawin' like the verra deevil. Ay, an' we'll blaw an' we'll rair an' we'll shoot till the wa's o' wickedness come rattlin' aboot their lugs like a thousan' cairtfu's o' stanes. An' whut ir ram's horns, think ye? just the horns o' a muirlan' tip; but the tip horns that Joshua tootit on had nae siller rims on them an' nae siller mooth-piece, like the trumpets nooadays, an' nae gran' polishin' on them; na, na; they were joost coorse ruhh horns wi' a hole bored in the sma' en' o' them wi' a red-het airn. An' whaur is the tip horns o' Joshua noo, tae blaw the wa's o' oor Gallawa Jericho? Ay, whaur, think ye? they're the elders an' Sunday-school teachers that's stannin' afore ye; an' wi' the help o' the Lord we'll toot an' we'll blaw an' we'll rair frae yae en' o' the parish tae the ither, till the wa's o' wickedness is fleein' in a thousan' flinners. *Come up, lasses, an' get yer picter-books!*'"

CONCERNING the long-bow, no American effort can surpass one that comes to us from Scotland:

"It was told that Colonel Andrew M'Dowall, when he returned from the war, was one day walking along by The Myroch, when he came on an old man sitting greetin' on a muckle stane at the road-side. When he came up, the old man rose and took off his bonnet, and said,

"'Ye're welcome hame again, laird.'

"'Thank you,' said the colonel; adding, after a pause, 'I should surely know your face. Aren't you Nathan M'Culloch?'

"'Ye're richt, 'deed,' says Nathan; 'it's just me, laird.'

"'You must be a good age, now, Nathan,' says the colonel.

"'I'm no verra aul' yet, laird,' was the reply; 'I'm just turnt a hunner.'

"'A hundred!' says the colonel, musing; 'well, you must be all that. But the idea of a man of a hundred sitting blubbering that way! What ever could *you* get to cry about?'

"'It was my father lashed me, Sir,' said Nathan, blubbering again; 'an' he put me oot, so he did.'

"'Your father!' said the colonel; 'is your father alive yet?'

"'Leevin! ay,' replied Nathan; 'I ken that the day tae my sorrow.'

"'Where is he?' says the colonel. 'What an age he must be! I would like to see him.'

"'Oh, he's up in the barn there,' says Nathan; 'an' no in a horrid gude humor the noo, aither.'

"They went up to the barn together, and found

the father busy threshing the barley with the big flail and tearing on fearful. Seeing Nathan and the laird coming in, he stopped and saluted the colonel, who, after inquiring how he was, asked him what he had struck Nathan for.

"'The young rascal!' says the father, 'there's nae dooin' wi' him; he's never oot o' a mischief. *I had tae lick him this mornin' for throwin' stanes at his grandfather!*'"

Galloway folk are not given to change, as per herewith sample:

"Gie us a story or two! Verra weel, then, here's yin. George Dalrymple was a drainer, and he lived in a wee thatch house at Pilwherry road-end in The Inch, and he came out of Ayrshire, and so he was a kind of ignorant buddy; and as he belonged to the Unitarians, he was not very well acquainted with the inside of the kirk; for about Ayrshire Unitarian does not mean very much in the way of religion, but rather the other way. However, he had a wean that took the mezzles and died, and the minister gaed his wa's up to try and comfort them. It was the minister of New Luce, for the wife had been at that kirk a time or two.

"'Ay,' says the minister, with a sympathizing sigh, 'we must take comfort in the knowledge that the Lord has taken it to a better place.'

"'Of coorse, Sir,' says Geordy, showing off his godliness; "we ken a' that; the Lord hae him safe in Beelzebub's bosom by this time. It's certainly very kind of Him.'

"'Abraham's bosom, my good man,' says the minister; 'it's Abraham's bosom you mean.'

"'I mean naething o' the kin', Sir,' says Geordy; 'I mean what I say. Yer Awbraham's bosom may do weel eneuch for a wheen Gallawa folk, but oor wean's gaun nae siccan gate; a' oor freens haes gane tae Beelzebub's bosom this lang eneuch, and we're no gaun to change.'"

From an old friend in the Genesee country we have the following, copied from a tombstone in the grave-yard at Bethany Centre, New York:

EDWARD HODGKINS,
A Soldier of the Revolution,
Died May 10, 1835, aged 83.
And SUSAN, his Wife,
Died April 17, 1847, aged 93.
We honor those who sot us free,
And thank them for our Liberty.

This epitaph on a young lady who was accidentally shot by a school-mate is copied from a stone in the grave-yard at New Boston, New Hampshire:

Thus fell this lovely, blooming daughter
By the malicious hand of a revengeful Henry.
On the way to school he met her,
And with a six self-cocked pistol shot her.

In the same grave-yard a woman is eulogized as having been "a good mother and a loving concert."

Three or four years ago the Methodists of El Dorado, Kansas, completed their church building, and, in anticipation of a good time, sent for Brother D. P. Mitchell, the recent Greenback candidate for Governor, to come over to El Dorado and dedicate the new church. On the appointed day Brother Mitchell made his appearance. Being known as a "big gun" of the Methodist Church, a great crowd turned out to hear the dedicatory sermon. After preaching, it was proposed to take up a collection to pay off the church debt. An appeal was made, and the brothers came down lively with their subscriptions; but it was found on counting it up that a few dollars were lacking. Brother John Teter, an old Virginian, and a second cousin of Brother Mitchell, was a member of the church, and had already subscribed one hundred dollars. During the second appeal the preacher noticed Brother Teter putting his hand in his pocket.

"Well," said Brother Mitchell, "are you going down in your pocket for more money, Brother Teter?"

"No," said Brother Teter; "I am hunting for my tobacker."

Looking him straight in the eyes, Brother Mitchell said, "There is but one place in the Bible that justifies the use of tobacco."

"What's that?" said Brother Teter.

"'He that is filthy, let him be filthy still,'" remarked Brother Mitchell.

This brought down the house, and also brought out the balance of the money necessary to pay off the indebtedness of the church.

As every body in that portion of Kansas knows John Teter, of course they can fully appreciate the joke.

"DEAR TOM, LET'S LIVE SO QUIET."

TOM'S LITTLE STAR; OR, THE ART AND THE WOMAN.

Sweet Mary, pledged to Tom, was fair
And graceful, young and slim.
Tom loved her truly, and one dare
Be sworn that she loved him;
For, twisting bashfully the ring
That sealed the happy fiat,
She cooed: "When married in the spring,
Dear Tom, let's live *so* quiet!

"Let's have our pleasant little place,
Our books, a friend or two;
No noise, no crowd, but just your face
For me, and mine for you.
Won't that be nice?" "It is my own
Idea," said Tom, "so chary,
So deep and true, my love has grown.
I worship you, my Mary."

She was a tender, nestling thing,
A girl that loved her home,
A sort of dove with folded wing,
A bird not made to roam,
But gently rest her little claw
(The simile to carry)
Within a husband's stronger paw—
The very girl to marry.

Their courtship was a summer sea,
So smooth, so bright, so calm,
Till one day Mary restlessly
Endured Tom's circling arm,
And looked as if she thought or planned.
Her satin forehead wrinkled,
She beat a tattoo on his hand,
Her eyes were strange and twinkled.

She never heard Tom's fond remarks,
His "sweety-tweety dear,"
Or noticed once the little larks
He played to make her hear.
"What ails," he begged, "my petsy pet?
What ails my love, I wonder?"
"Do not be trifling, Tom. I've met
Professor Shakspeare Thunder."

"PROFESSOR SHAKSPEARE THUNDER."

"Thunder!" said Tom; "and who is he?"
"You goose! why, don't you know?"
"I don't. She never frowned at me,
Or called me 'goose.' And though,"
Thought Tom, "it may be playfulness,
It racks my constitution."
"Why, Thunder teaches with success
Dramatic elocution."

"Oh! Ah! Indeed! and what is that?
My notion is but faint."
"It's art," said Mary, brisk and pat.
Tom thought that "art" meant *paint*.
"You blundering boy! why, art is just
What makes one stare and wonder.
To understand *high* art you must
Hear Shakspeare read by Thunder."

Tom started at the turn of phrase;
It sounded like a swear.
Then Mary said, to his amaze,
With nasal groan and glare,
"'To be or-r—not to be?'" And fain
To act discreet yet gallant,
He asked, "Dear, have you any—pain?"
"Oh no, Tom, I have *talent*.

"Professor Thunder told me so;
He sees it in my eye;
He says my tones and gestures show
My destiny is high."
Said Tom, for Mary's health afraid,
His ignorance revealing,
"Is talent, dear, that noise you made?"
"Why, no; that's Hamlet's feeling."

"He must have felt most dreadful bad."
"The character is mystic,"
Mary explained, "and very sad,
And very high artistic.
And you are not; you're commonplace;
These things are far above you."
"I'm only," spoke Tom's honest face,
"Artist enough—to love you."

From that time forth was Mary changed;
Her eyes stretched open wide;
Her smooth fair hair in *friz* arranged,
And parted on the side.
More and more strange she grew, and quite
Incapable of taking
The slighest notice how each night
She set Tom's poor heart aching.

As once he left her at the door,
"A thousand times good-night,"
Sighed Mary, sweet as ne'er before.
Poor Tom revived, looked bright.
"Mary," he said, "you love me so?
We have not grown asunder?"
"Do not be silly, Tom; you know
I'm studying with Thunder.

"That's from the famous Juliet scene.
I'll do another bit."
Quoth Tom: "I don't know what you mean."
"Then listen; this is it:

"DEAR LOVE, ADIEU."

'Dear love, adieu.
Anon, good nurse. Sweet Montague, be true.
Stay but a little, I will come again.'
Now, Tom, say 'Blessèd, blessèd night!'"
Said Tom, with hesitation,
"B-blessèd night." "Pshaw! that's not right;
You've no appreciation."

At Tom's next call he heard up stairs
A laugh most loud and coarse;
Then Mary, knocking down the chairs,
Came prancing like a horse.
"'Ha! ha! ha! Well, Governor, how are
ye? I've been down five times, climbing up
your stairs in my long clothes.'
That's comedy," she said. "You're mad,"
Said Tom. "'Mad?' Ha! Ophelia!
'They bore him barefaced on his bier,
And on his grave rained many a tear,'"

She chanted, very wild and sad;
Then whisked off on Emilia:
"'You told a lie—an odious, damnèd lie.
Upon my soul, a lie—a wicked lie.'"

She glared and howled two murder scenes,
And mouthed a new French *rôle*,
Where luckily the graceful miens
Hid the disgraceful soul.
She wept, she danced, she sang, she swore—
From Shakspeare—classic swearing;
A wild, abstracted look she wore,
And round the room went tearing.

"AND ROUND THE ROOM WENT TEARING."

And every word and every pause
Made Mary "quote a speech."
If Tom was sad (and he had cause),
She'd say, in sobbing screech,
"'Clifford, why don't you speak to me?'"
At flowers for a present
She leered, and sang, coquettishly,
"'When daisies pied and violets blue.'"
Tom blurted, "That's not pleasant."

But Mary took offense at this.
"You have no soul," said she,
"For art, and do not know the bliss
Of notoriety.
The 'sacred fire' they talk about
Lights all the way before me;
It's quite my duty to 'come out,'
And all my friends implore me.

"Three months of Thunder I have found
A thorough course," she said;
"I'll clear Parnassus with a bound."
(Tom softly shook his head.)
"I can not fail to be the rage."
(Tom looked a thousand pities.)
"And so I'm going on the stage
To star in Western cities."

And Mary went; but Mary came
To grief within a week;
And in a month she came to Tom,
Quite gentle, sweet, and meek.
Tom was rejoiced: his heart was none
The hardest or the sternest.
"Oh, Tom," she sobbed, "it looked like fun,
But art is dreadful earnest.

"Why, art means work and slave, and bear
All sorts of scandal too;
To dread the critics so you dare
Not look a paper through;

"I'LL CLEAR PARNASSUS WITH A BOUND."

Oh, 'art is long' and hard." "And you
Are short and—soft, my darling."
"My money, Tom, is gone—it *flew*."
"That's natural, with a starling."

"I love you more than words can say,
Dear Tom." He gave a start.
"Mary, is that from any play?"
"No, Tom, it's from my heart."
He took the tired, sunny head,
With all its spent ambitions,
So gently to his breast, she said
No word but sweet permissions.

"Can you forgive me, Tom, for—" "Life."
He finished out the phrase.
"My love, you're patterned for a wife.
The crowded public ways
Are hard for even the strongest heart;
Yours beats too softly human.
However woman choose her art,
Yet art must choose its woman."

"CAN YOU FORGIVE ME, TOM?"

HARPER'S
NEW MONTHLY MAGAZINE.

No. CCCXLIV.—JANUARY, 1879.—Vol. LVIII.

ST. GEORGE'S DOCK, LIVERPOOL.

ENGLAND'S GREAT SEA-PORT.

THERE were over 170 cabin passengers on board our steamer as she sailed up the Mersey, most of them being pleasure-seekers, and some having much time at their disposal, with elaborate itineraries that embraced pretty nearly every place on the Continent from Dieppe to Constantinople; but only two of the voyagers staid in Liverpool; the others omitted the vast sea-port, and hurried away to Chester or London by the first trains, content with the superficial reconnoissance possible in the brief drive from the landing to the railway. It is nearly always so with Americans. Fully three-fifths of the whole number who go abroad embark and disembark at Liverpool, and few devote more time to it than that of the unavoidable delay between the arrival of the steamer and the departure of the train. Many travellers have unfavorable reminiscences of it. The approaches are difficult; the shoals are variable, and the currents are strong; the bar is only passable to large vessels for a short time at each tide; and the ease and safety of the pilot's task in New York Harbor are not found by the navigator at the estuary of the Mersey, for the hydrographical embarrassments are supplemented by others of a meteorological nature.

The late Mr. Greeley's distinction between the statement charged against him, that every Democrat was a horse thief, and his real utterance, that he had never known one who was not, serves us here, for though we are quite unwilling to say that the weather is persistently inclement at the Liverpool bar, our experience includes very few instances to the contrary; and of all abomi-

Entered according to Act of Congress, in the year 1878, by Harper and Brothers, in the Office of the Librarian of Congress, at Washington.

nably dismal things in the world, embarkation at Liverpool in a fog is superlative. The great steamer lying at anchor in the stream, drenched with slippery moisture, and the noisy little tender under her gangway; the alarming discord of the fog whistles and bells; the brown, clammy, breathless weight that gives exaggerated size to the nearer objects and obliterates those that are far; the dull, twilight, woolly sphere in which we seem to be suspended; and the penetrating, ague-like cold that is quite independent of season—these are some of the circumstances and environments; and who, unhappily, that has often come to Liverpool or left it, by sea, does not shudderingly remember them? Then, if it has been a departure, the little tender has rung her farewell bell, and the great steamer has moved cautiously down stream, the faithful captain spending a sleepless night on the bridge, his beard glistening with moisture, and his eyes strained to the utmost, while the passengers have nervously gathered in the cabins, unable to endure the chilling, despondent mystery on deck. At Queenstown next morning the weather has been fair enough, no doubt, and Liverpool has taken her place in the memory as the dull and undesirable city of fogs.

As we steamed northward up the St. George's Channel in the *Chester*, the day was mellow and tranquil, and the bold front of the Irish coast looked sleepy under the vaporous gold of the atmosphere; and as we altered our course to the eastward and turned round by the light-house on the rocky and lonesome Skerries Island, bringing the Welsh coast into view, the evening became full of impassioned color; but at daylight we were lying in the Mersey opposite the landing-stage, and, alas! as usual, a monotonous veil of leaden gray hung over all visible objects, and the English June, the month of months, that had been so poetically extolled by the natives on board, appeared forbiddingly sunless and austere. For more than a week there was no change in this dispiriting weather. The rain fell in torrents, and was swept up into fountains by a bleak northwesterly gale. At odd times far between, a great coppery sphere came out of the gray overhead, and that was the sun despoiled of all its fiery radiance, or rather it was said to be the sun by the inhabitants, who observed its emergence with fatuous expectations of the clearing that was so long in coming. But even while the inclemency continued there were some charms to be discovered in the neighboring peaks, where the foliage was thick, succulent, and fresh, and the interspaces of the trees were filled with wonderful depths of almost ultramarine blue, which imparted a queer sense of mystery and sequestration to us. English birds were full-throated and blithesome too, despite the saddening rain, and the cuckoo's echo-like note could be heard ringing over the fields beyond Eastham. These charms were not enough to compensate for the sloppy streets, and the unseasonable bleakness that made winter garments indispensable, however; and the climate must go without extenuation, for though as we write the weather evokes congratulations among the inhabitants, out of our window we can see no change in the leaden hue above, except a streak of obscure blue here and there, and down the hill upon which the town clusters is a brown stratum of smoke that is constantly being renewed by thousands of obtrusive chimneys, some not more than a foot, and others 200 feet, high.

The chimneys are a feature of Liverpool. Every eminence reveals them bristling along the gable roofs of the cottages, and each pours out a heavy wreath of bituminous vapor, which drapes the handsomest buildings with intangible crape, and gives the streets an appearance of funereal mourning.

Having acknowledged these unpleasantnesses, it remains for us to look at some of the better things about the town, which is interesting, and in some particulars unique. It is modern as places go in England, and the topographical changes that are constantly being made have left it with scarcely a building more than a hundred years old. The ancient and picturesque are sacrificed to the convenience of commerce and the demands of a population which increases with American rapidity; and in the spring the streets remind one of New York or Chicago by the dusty gaps in them, where the trowel is tinkling, and imposing structures of granite or sandstone are rising upon the old foundations of modest shops, whose two or three stories were formerly considered magnificent. But the town is modern only in the English sense, and mention is made of it in a deed of the Saxon King Æthelude, dated sixty years before the Norman Conquest. At this period, and for several hundred years later, it was small and unimportant, consisting of a castle built by Roger of Poitou (a knight who played fast and loose with the confidences of William the Norman), and a few fishermen's huts under the walls, for even in those days the sea yielded what trifling revenues it had. When the ports of the kingdom were levied upon for contributions to the navy, Liverpool's share was the smallest, and its progress was slow for many years, one historian describing it in the sixteenth century as "a paved town that hath but a chapel. Walton, a IIII miles off, not far from the Se, is the paroche churche. The King hath a castelet ther, and the Erle of Darbe hath a stone house ther. Irish merchaunts come much thither as to a good haven." In 1565 the

THE PORT OF LIVERPOOL.

number of householders was only 138; the whole shipping consisted of twelve "barkes," with a total of 223 tons; and when the inhabitants had occasion to petition Queen Elizabeth, they described themselves as "her Majesty's poor decayed town." It became the scene of some notable events in the civil war, and in the summer of 1644 Prince Rupert, a nephew of Charles the First, besieged it and took possession of it. In the following year it fell into the hands of the Parliamentary troops, whose party conferred upon it the privileges of a free and independent port, in no wise subject to Chester, which had overshadowed it; and as the Dee became choked by millions of tons of detritus, the Mersey superseded it, Chester now being a sea-port in name only. In the eighteenth century the navigable length of the Mersey was much extended, and the initial dock was built.

Heretofore the trade had been limited to coasting vessels, those bound to distant seas resorting to Chester; but in 1709 a sloop of thirty tons left Liverpool for the west coast of Africa, and in 1753 the traffic with Africa employed eighty-eight vessels belonging to the port. One hundred other vessels were used in trade with North America and the West Indies, 125 in the coasting trade, and eighty on the river.

The African trade was staple in slaves, and many a princely fortune was scandalously acquired in it. "Men of Liverpool, I despise you!" burst out an actor who had been hissed in the theatre one night; "there is not a brick in your town that is not cemented with the blood of a suffering African." But it was good William Roscoe, a native of Liverpool, who was most zealous in support of the measure passed by Parliament in 1807 by which the traffic was declared illegal; and it is to the credit of the town that, while much of its prosperity was derived from the inhuman business, Roscoe, whose principles were avowed and understood, was elected at the head of the poll in 1806.

The first dock constructed proved to be a most difficult and costly work. After an elapse of eight years it was found that instead of £6000, which sum had been granted by Parliament, £11,000 had been expended, and £4000 more were required. The work was completed in 1720, and the facilities of the port being thus advanced, attention was directed to the inadequacy of the landward means of communication. No stage-coach came to Liverpool. Ladies travelled in private carriages, and gentlemen on horseback, always at the risk of an encounter with the polite highwaymen of those days, whose affable manner of larceny is embalmed in the romances of William Harrison Ainsworth. Heavy wagons with merchandise arrived from London twice a week, taking ten days to perform the journey—a speed that would be discreditable to the leisurely bull teams of the Western plains; and in 1757, when a coach line to London was established, the time was four days. Then the canal system was developed, and with its opening, as with that of the first passenger railway, Liverpool was intimately associated. In 1771 the dock accommodations were increased to thirteen acres, the number of seamen belonging to the port was fully 6000, and the entire population was about 34,000. Pleading with Queen Bess in 1571 as "a poor decayed

STRAND STREET.

town," and having grown in 200 years to the proportions above mentioned, Liverpool's subsequent progress is beyond comparison in England for energy, brilliancy, and continuity. Fields that were far away from the gloom and taint of the town not more than fifteen years ago—where the haymakers toiled under the filmy sky, and pastoral life was uninvaded by the strident influences of commerce—are quite effaced, and in their space is the heart of a compact region of finished streets, paved, flagged, lighted, and drained.

It is worth while to note the annual development indicated by the statistics supplied by a local board. In 1771, 2087 vessels paid harbor dues; in 1781, 2512 vessels; in 1791, 4045 vessels; in 1801, 5030 vessels; in 1811, 5616 vessels; in 1821, 7810 vessels; in 1831, 12,537 vessels; in 1841, 16,108 vessels; in 1851, 21,071 vessels; in 1861, 21,095 vessels; and in 1871, 20,124 vessels. Though there was little increase in the number of vessels during the last decade mentioned, the tonnage had grown from 4,641,791 tons in 1861 to 5,602,187 tons in 1871. The number of vessels now entering the port annually is much less than that of London, but the tonnage is about the same as that of the metropolis.

Any one desiring to study the statistics of trade in New York finds a convenient digest of them in the valuable annual of the Chamber of Commerce; but the institutions of Liverpool do not often indulge in publications, and though the town has a Chamber of Commerce, it is to some extent a secret chamber, issuing no general report, and the searcher after facts must tackle those literary mausoleums, the Parliamentary blue-books. These blue-books are wonders of accuracy, comprehensiveness, and scientific arrangement, and from them we learn that the total importation of raw cotton into the United Kingdom in 1876 was 13,284,454 hundred-weight, 616,345 hundred-weight of which went to London, and 12,503,018 hundred-weight to Liverpool. The other principal imports into Liverpool were 5,880,818 gallons of petroleum; 2,228,606 hundred-weight of bacon and hams; 3,452,520 hundred-weight of rice; 1,520,279 proof gallons of brandy; 2,740,675 proof gallons of rum; 39,410,513 pounds of unmanufactured tobacco; 1,097,610 pounds of snuff and cigars; 2,345,337 gallons of wine; 40,621,042 pounds of sheep's and lambs' wool; 3,425,996 pounds of alpaca, vicuña, and llama wool; 3,886,783 hundred-weight of unrefined sugar; 145,673 hundred-weight of refined sugar; 233,875 loads of hewn wood; 525,719 loads of split or sawn wood; 12,098 loads of staves; 12,856 loads of mahogany; 177,408 hundred-weight of salt and fresh pork; and 781,394 hundred-weight of cheese.

The exports from Liverpool of articles produced in the United Kingdom during 1876 were principally clothing to the value of

$1,921,840, 97,545 barrels of beer and ale, hosiery and small wares to the value of $8,276,155, earthenware to the value of $5,096,145, haberdashery and millinery to the

Hill, and seeing the long, twinkling line of yellow lights below, exclaims, with childish amazement, "That's a bigger mine than ours!" "That, boy, is Liverpool," one of

THE PERCH ROCK LIGHT.

value of $7,295,045, cutlery to the value of $8,107,350, 88,288,447 yards of linen piece goods, 27,238,600 yards of jute manufactures, machinery to the value of $10,091,715, 12,434,900 yards of woolen cloths, 86,255,000 yards of mixed and worsted stuffs, and 7,083,100 yards of flannels and carpets.

Here, dear reader, whose soul is above mathematics, and whose patience chafes under details, let us urge you to give some consideration to these items, which show how extensive an entrepôt the "poor decayed town" has become, and how varied and vast a traffic the cotton mills of Lancashire, the potteries of Staffordshire, and the woolen mills and steel-works of Yorkshire have developed on the turbulent current of the Mersey.

Four-fifths of the whole trade between Great Britain and the United States passes through Liverpool, as the American consul of former days realized through the handsome total of his fees, and the custom duties paid into her Majesty's Treasury amount to about $20,000,000 annually. In 1871 the population had increased to 493,346, and it is now not less than 500,000, which does not include Birkenhead on the opposite side of the river, nor Bootle, which has recently been detached from Liverpool, and incorporated as a separate borough. The floating population of seamen is also excluded, and that itself is not less than 25,000.

Some native of Liverpool, far away from the old town, into whose sun-burned hands this Magazine may fall, perchance, will be glad to share the writer's recollections of a novel, by Albert Smith, in which a small boy named Christopher Tadpole is hero. Christopher, who has been stolen from a Cheshire salt mine, arrives, with his kidnappers, at night, on the summit of Bidston

the men responds, with melodramatic sententiousness.

Bidston Hill is there still, of course, with the venerable light-house that points the sandy coast, and the observatory that takes telegraphic account of all the shipping gliding to and from the harbor, although the "Ring o' Bells," where the ham-and-eggs and chops and steaks used to be so famous, is not in existence; but the lamps have been multiplied many times since little Christopher widely opened his eyes at them; and if the man in the light-house tower is not soulless, he must feel some awe in thinking, during his watchings, of the throbbing, complex, shifting life below him.

From Bidston we get a wide view of the river as well as the town. An old pun is current in local burlesques that "the quality of Mersey is not strained," and one would need more than a cat's attachment to locality and an abnormal development of approbativeness to say contrarily. The source is in the confluence of some small rivulets on the Cheshire and Derbyshire frontier, and the general course of the stream is north and south. At the northern extremity it empties into the Irish Sea, a narrow arm of sand, backed by hills of gorse and heather, separating it from the mouth of the Dee, whose former commerce it has diverted to itself. The estuaries of both streams are of great breadth, and are walled in to the westward by the stern cliffs of the Welsh coast, which have echoed the last wild cry of many a perishing mariner; but the navigable channels are not numerous, and at low tide long, desolate, melancholy reaches of mud and sand appear in place of the ripples and white combers. Only the combers are white; the smooth water is turbid, and that is a word which applies to the stream

from its outlet to Warrington, some thirty miles, beyond which we do not know what its quality is.

Passing Hilbre Island, which is insular at high tide only, and the Bell Buoy, which peals out sadly at the rocking of the waves, the inward-bound ships enter the populous part of the river as they go by the Perch Rock Light—a circular tower of Anglesey granite in the same style as the celebrated Eddystone. On the western or Cheshire side there are the watering-place suburbs, New Brighton, Egremont, and Seacombe, the former two having ornamental iron promenades extending into the river, with landing-stages for steamboats at the ends. Near Seacombe a river wall of masonry begins, and continues as far south as Tranmere, passing along the borders of Woodside (the Brooklyn of Liverpool), Monk's Ferry, and the ship-building yards of the Lairds, who have launched scores of vessels that are celebrated, including the piratical *Alabama*. As far as the eye can reach on the Lancashire side there is a granite wall, like a splendid fortification, and behind this are the docks, with myriad masts rising from them, and a black net-work of rigging. The tide runs strong and fast, and the difference between high tide and low tide is never less than fourteen feet; sometimes it is six feet more. When it is high, not more than eight or nine feet of the wall are seen; and when it is low, the whole height is visible, the lower part being green and brown with sea-weed and barnacles. Whatever its condition is, the shipping in the docks rides securely at an approximation to high-water mark, the water in them being kept at a uniform height by means of enormous flood-gates. The town is built upon a hill, but in ordinary weather the elevations are hidden in the smoke, and only the enormous rectangular warehouses, six or seven stories high—commercial fortresses, built of iron, brick, and granite—can be discovered.

The scene on the river is active and exhilarating, and is particularly notable for the number of ocean-going steamers which it includes. Ten of the transatlantic lines, which have regular sailings, and employ the largest and best class of vessels, are established in Liverpool, some dispatching one and others two or three a week for New York, Quebec, Boston, Philadelphia, or New Orleans; and it is common to see a group formed of a representative vessel of each—one with the chaste white and black funnel of the Inman line, another with the startling red of the Cunard, another with the tasteful pink and white of the Allan line, another with the fashionable stocking-like cardinal red and black of the Guion line, another with the key-stone red and white design of the American line, another with the pure white of the National, and another with the creamy yellow of the White Star. There are other lines sailing to American ports at uncertain intervals, and a very extensive fleet of steamers is employed in the Mediterranean, Baltic, and coasting trades, most of them being of recent build, iron in material, and graceful in outlines. One is distinguished from the other by the color of the funnel, and the same badge is used by the various tow-boats on the river. The tow-boats are broad-beamed side-wheelers, much larger and stancher-looking than those in American harbors, the opposite being the case with the ferry-boats, which, excepting a few instances, are smaller and less commodious than those of New York, Boston, or San Francisco. The brilliancy of the funnels often relieves the dullness of the smoky pall upon the river, to which each one of the steamers, large and small, bound seawise or coastwise, contributes voluminously. Much have the Americans to be thankful for in the plenitude of anthracite, whose blue, spirit-like emanations do not cast upon their buildings a homogeneous gloom, nor seal the precious beauty of the sky. Soft bituminous coal is used in Liverpool, and the fairest days are choked by its contaminating, soot-distributing vapors.

Besides the steamers, a flotilla of sailing craft is constantly beating to and fro upon the river—handsome clippers which unite Occident and Orient, the pleasure yachts of the merchants, spry schooners, and bulky "flats." The latter are consummately ugly, lacking all the airiness that makes other vessels life-like and inspired. They are of great breadth, depth, and carrying capacity, but when they are loaded, only a few feet of their black and unornamental hulls are visible. A short thick mast gives them some resemblance to a sloop; their sails, like those of the fishing boats in the harbor and channel, are dyed to a copper bronze, and they drift inertly and ungracefully in the way of finer and larger vessels.

In a northwesterly gale the Mersey is unsheltered, and the wind whips it into big and crested waves, which dash high over the sea-wall of granite. Then the scene becomes as exciting to the spectator as it is perilous to the mariners. The sailing vessels seesaw on the billows and bury their prows in the foam as they tack against the current; even the bulky ocean steamers show symptoms of the oscillatory possibilities of their vastness that are not usually seen except in mid-ocean; the tow-boats reap a harvest of salvage; sails are torn into strips by treacherous gusts; and the life-boats hurry over the bar in answer to the signals of distress. In the fierce storms of March the open sea is almost preferable to the river, where the height and force of

A FLEET OF MERSEY RIVER FLATS.

the waves compel most of the ferries to suspend traffic.

The steamer trade of Liverpool having the proportions we have described, it is not to be wondered at that many colossal fortunes have been made in it, and that its history includes many chapters of Aladdin-like lives. The acquisition of fame and splendid fortunes, the development of the thrifty clerk into a prosperous merchant, and the undreamed-of embryos that many grand enterprises have had, are familiar in nearly all mercantile communities; but it is not often that the beginning is so inauspicious, the progress so swift, and the attainment so magnificent as they were in the case of the principal owner of the Leyland line.

Some years ago a respectable widow kept a small chop-house in one of the Liverpool by-ways, and through the excellence of her mutton and her discretion in cooking it to a delicious turn, attracted many well-to-do old merchants and brokers, whose sober and conservative habits led them to choose her drowsy little parlors rather than the gaudier modern restaurants. Grateful with the gratitude that a satisfied appetite evokes, her patrons found an occasion when they proposed to make the culinary widow a handsome present, which she, being independent and no doubt easy in circumstances, declined to accept. She had a son, however, and as they who were so well content with her chops would not be thwarted in their benefactions, they took him in charge, educated him, and obtained a situation for him with the owners of the Bibby line of steamers. The boy was not by any means unworthy. He identified himself with his employers' interests, and, partly by merit, partly by good luck, sprung from one position to a higher one, until he stood on the highest. The line is now called after the boy's name—the Leyland line—and its pink-funnelled steamers are to be seen in every port on the Mediterranean, from Gibraltar to Alexandria; some of them are 4000 tons burden, and all are built of iron. The founders of another line of steamers began in a less humble way. They possessed some wealth, and opened steam traffic with a few ports on the coast; then they sent five steamers across the Atlantic—an undertaking regarded at the time with more concern than an expedition to the pole is looked upon to-day; and now they possess a fleet of steamers numbering about forty, the largest being about 5000 tons burden, and the smallest 1000 tons. Prodigious success has attended these old ship-owners. Carrying over 2,000,000 passengers, they have not lost the life of one through any fault of their own or their officers, and in forty years they have only lost four vessels.

Let us now glance at the arrangements for the landing and embarkation of passengers. The difference between high water and low water is so great that entrance to or from the docks can only be had when the tide is full, and for the same reason passengers can not be landed or taken on board vessels at the sea-wall except at certain hours. The passenger traffic, both on the numerous ferries and from ocean and coastwise steamers, is too large and important for restrictions, and the difficulty was met and removed by the construction of a floating landing-stage, placed at a central part of the river-front, and connected with the masonry sea-wall by hinged bridges. The stage rose and fell with the tide; when the tide was high, the bridges were level with the sea-wall, and when it was low, they formed an inclined plane, affording at all times a safe and commodious way to or from the vessels moored alongside the stage. The earliest structure being reserved for the ferry-boats, a second one was built a little to the south of the first for ocean and coastwise traffic, and after many years the two were united—an improvement which, with others in the approaches and docks, cost $20,000,000. The completion of the alterations was to have

GRAVING-DOCKS.

been celebrated in the autumn of 1874, and the Duke of Edinburgh had accepted an invitation to officiate, but an explosion of gas occurred, and the work was destroyed. As the disheartening news spread through the town, it was taken with ridicule and incredulity. "Tell us that the deep and broad Mersey is ablaze!" said the confident citizen, with a pleasant touch of the Lancashire dialect in his voice, and he would not believe until the flames were reflected in the sky and still more positive ocular proof was given. The famous Brasseys were employed to renew the structure, which was again completed in March, 1878, and it is the finest of the kind in the world. The new stage is 2052 feet in length, and from 80 to over 100 feet in width. The floating power is supplied by iron pontoons, upon which are placed five longitudinal iron kelsons twenty feet apart, and across the kelsons is a series of iron beams forming the support of the greenheart planking constituting the deck. The entire structure is kept in position by several heavy moving chains attached to the masonry of the sea-wall, and by four iron booms. It is approached by seven iron bridges for pedestrians, and a floating-bridge 300 feet long and 40 feet wide for vehicles. Nearly all the passenger traffic of the port is conducted by it, and not less than 50,000 persons use it daily, one ferry alone carrying 28,000 in every twenty-four hours, or 10,500,000 in a year. The passengers from the American and other foreign steamers are landed upon it by steam-tenders, which illustrate by their defective form the amazing conservatism and eyelessness to comfort of the English in their travelling arrangements. The only cabin is in the hold of the boat, and the seats on deck are insufficient and uncomfortable. When the passengers are disembarked upon the stage, however, the other provisions are found to be admirable. The baggage is carried by broad-backed licensed porters from the tender into a large well lighted and ventilated hall, the packages of each passenger are put together, an unusually courteous species of a customs officer examines them, and when they are passed, the porters shoulder them and carry them to the cabs, which are waiting at the head of the bridges, charging twenty-four cents for each trunk and twelve cents for each smaller package. These porters are under police supervision, and are uniformed, wearing a numbered brass badge on the right arm, and a peaked cap with a broad red band; they dress in white mole-skin, and though most of them are under-sized, the ease with which they seize a monstrous Saratoga, swing it upon their shoulders, and trot up hill with it is surprising.

In addition to the Customs Boarding Station the stage is provided with spacious sheds for the shelter of passengers, refresh-

ment-rooms, a telegraph-office, post-office letter-boxes, and offices in which parcels may be left until called for or forwarded. It has the appearance of a great barge, and its ponderous bulk is unshaken in the heaviest gale. There is animation at all times, and life in many varieties is discovered upon it. A large proportion of the eager crowd is in a nervous hurry to catch a boat or train, and the anxiety about tickets or baggage removes the mask of self-consciousness from the throng — the man who struts when he feels that he is being looked at resumes his natural shambling and ungraceful gait; the fastidious young lady forgets her deportment, and gathers her skirts in her hands to dash for a departing steamer, her bland smile changing all unawares to an ominous and pink vexation—conceit, affectation, and all insincerities fall off like scales, to be renewed when the actors and actresses recover and find that they are observed. Should our gentle reader stand and watch near Simpson's Bowl, he could not wish for a more stirring sight than that which surrounds him. Parenthetically Simpson is a local oddity, mine host of the landing-stage refreshment-rooms, whose vagaries are mostly philanthropic, and the bowl is a wooden vessel for the reception of contributions to any charity that may be pressing in its necessities. Last June the bowl was put out in behalf of the sufferers from the Haydock colliery explosion; day after day the passers-by filled it with coins varying in denominations from farthings to sovereigns, and an amount equivalent to $5000 was collected in this simple way in one month. Previously it had done service for the sufferers of the Indian famine; and because it is placed at a busy part of the stage, and is inclosed by the beneficent atmosphere of charity, it is a good point of view.

The sailor is omnipresent in Liverpool, and the landing-stage is a favorite haunt of his, where he may be seen coming ashore with the tan on his face and hands of the climes which Jean Ingelow prettily speaks of as

> "that red land
> Where lovely mirage works a broidered hem
> To fringe with phantom palms a robe of sand."

—coming home with his canvas bag thrown over his shoulder, his heart light, and the pent-up deviltry of a long voyage craving an escape. Ah! and Jack embarks again. It is the same old canvas bag that he carries with him, but the dissipations of the shore have altered him; his big blue eyes are not quite clear, and his complexion is not so honestly brown. On a calm evening one can hear him and his mates singing as they chase one another around the capstan and drag the anchor up; and the same wind that floats this music brings to the ears the discord of the engine on the modern steamer, which with hissing and coughing puts up sails, works the cables, and does most of the things that belong to the crew on the older-fashioned ships. Now a grizzled veteran saunters past us with a clay pipe in his mouth and his hands in his pockets; he

TOWN-HALL, FROM ST. GEORGE'S CRESCENT.

critically examines the various craft in the river, and turns a weather-wise eye up to the sky, shaking his head dubiously at the cumuli which are scudding in from the west. The sea and its messengers have still a charm for him, though they have twisted him with rheumatism and left his frame like a shattered hulk. But what a difference there is between the nautical life known to him, who now looks back upon the bitterest experiences with the tender regret into which memory betrays us, and the nautical life dreamed of and longed for by the school-boys who frequent the landing-stage and watch with ambitious desire the coming and going of the ships! What a difference indeed! and yet only that of the world untried and the aching disappointment of the world grown familiar. As if to broaden the shadow, two baneful touters of a sailors' boarding-house slouch by, uneasy under the gaze of a policeman, and their coarse faces make us think pityingly of the hapless prey that falls to them. Here is a string of emigrants bound for the Inman steamer that lies off the stage—Norsemen with knee-breeches, red or green vests, rows of buttons, and fresh, windy-

looking faces framed in yellow hair; chubby baby emigrants and withered old dames too frail for the severity of the passage; beetle-browed, iron-featured, bearded Muscovites, whose fur-trimmed, voluminous garments intimate how wild the climate of the steppes is; stolid peasants from Northern Germany; and overdressed Irish girls, who have been visiting the old country, and are returning to break the hearts of the unhappy housekeepers into whose service they enter. Mingling with these alien and yet familiar characters is the homogeneous Liverpool crowd of brisk commercial gentlemen, whose dress is the perfection of the tailor's art, their Albert coats fitting them like a glove, and the trousers idealizing their nether extremities; no matter what the weather is, these "swells" wear the glossiest of "top" hats, and a rose or a bunch of geranium adorns the silk lapels of their coats. Other constituents of the crowd are the clerks in suits of rough tweed, with low-crowned felt hats, and short brier pipes in their mouths; substantial girls and matrons with rosy cheeks and blue eyes, and dresses of quiet-colored fabrics; tremendous market-women, with wicker baskets balanced upon their heads, and short petticoats expanded by the anachronistic crinoline; the dreadful little "cad," with loud-patterned clothing and murderous carelessness of the Queen's English; shoe-blacks in the red uniform of the brigade; river pilots with purple faces, and voices that seem to come from the abdomen; pitiably ragged urchins, who offer fusees at two boxes for a penny; and yet more dilapidated mud-larks, who willingly scramble in the oozy mud along the river-wall for any copper thrown to them.

Considering how large the traffic is, the commotion is nothing to what it would be in America. The whistle of the steamers is not used as a signal, except during fogs, and only while the gangway is in position are passengers allowed to embark or disembark, any violation of the rule being attended by the arrest of the offender and his punishment with all the certainty that gives English law its reality and efficacy. The ferry to Woodside, a district of Birkenhead, is perfect in its equipment and management. The boats are similar to the American model; they are all built of iron, and have twin engines, which enable one paddle-wheel to be worked independently of the other; a telegraph communicates the captain's orders to the engineer; the steering is done by steam; smokers are strictly confined to the extreme ends of the deck; ladies have a separate cabin, and a spacious deck house and promenade is provided for both sexes. But the Woodside ferry is alone, and the others are very far behind it.

At the head of the bridges leading to and from the stage there is a carriage concourse, well paved and well lighted, and surrounded by an ornamental wall of brick with stone facings. This is the terminus of several omnibus lines; and at one side of it is a small building used for salt-water bathing, under the management of the corporation. The landing-stage and all the dock estate on both sides of the river are owned and administered by a body known as the Mersey Dock and Harbor Board, which also controls the pilots, and assesses and receives all dues of the port. It consists of twenty-four members, all of whom are honorary in their capacity; four are nominated by the Conservancy Commissioners of the Mersey, and the other twenty are elected by the dock rate-payers. Despite the variety of interests involved and the immensity of the trust, no scandalous charge has ever been brought against the administration, which is solely for the benefit of the port and the country. The value of the estate is about one hundred million dollars, and the income is about five million dollars annually. The docks extend for more than six miles in a continuous line, and comprise about four hundred and twenty acres—two hundred and fifty-five acres, with eighteen miles of quay margin, being on the Liverpool side, and one hundred and sixty-five acres, with nine miles of quay margin, on the Birkenhead side of the river. The total quay margin alongside of which ships

WAPPING DOCK AND WAREHOUSES.

can be moored is twenty-seven miles, and every quay is built of solid masonry, granite being the commonest material. The dry or "graving" docks also are formed of masonry, and a large iron steamer inclosed in one, with her Titanic proportions fully revealed, is a sight to remember. The quays are all covered by substantial sheds or warehouses, those of the new corn dock being ten stories high, with a cellar below the water-level.

A WOODSIDE FERRY-BOAT.

The corn is conveyed from the vessel by hydraulic machinery into the cellar, which is rat-proof and water-tight, and thence it is raised by an elevator, at the rate of ten tons a minute, to the parts of the building prepared for its storage, the capacity of the warehouses being about one hundred and sixty-five thousand quarters.

The Jack Tars are so numerous an element of the population, and so inestimably valuable in contributing to the prosperity of the port, that they are recognized in several institutions established for their comfort and protection, one of the best being the Sailors' Home, in Canning Place, a building which covers the whole of a block. As soon as a ship enters port she is boarded by an official, who transfers the men's baggage to the Home, and makes a small advance on account of their wages, if they need it. At the Home each man has a room or cabin to himself, supplied with cots, chairs, and dressing-tables. The dining hall is on the third of the five stories, and long tables are ranged across it, with a separate one at the head for the use of masters and mates. The fare is wholesome in quality and unlimited in quantity. Breakfast is at a quarter past eight, dinner at noon, tea at five, and supper at half past nine o'clock, and the dishes consist of soups, fish, poultry, joints, and puddings. Intoxicating liquors are not sold or allowed, except on Christmas-day, when Jack is gratuitously supplied with both grog and tobacco. In the way of amusements, there are musical and dramatic entertainments, a reading-room, a library, and a smoking-room. In the way of didactics, lectures are given in connection with private lessons on marine engines, nautical astronomy, navigation, and all that may become a good sailor, the fees being compatible with the pupils' means. The charges for board are four dollars a week to seamen, and three dollars to apprentices—a tariff which makes the Home almost self-supporting. In 1877, 9323 "A. B.'s," or able-bodied men, availed themselves of the advantages offered, and 301 "O. S.'s," or ordinary seamen; $259,760 were deposited in the savings-bank, which, with a money-order office in the building, is of incalculable benefit; cash deposited can be drawn at any sea-port in the kingdom, and three per cent interest is allowed. After having been paid off, the sailor is obliged to pass through the savings-bank, and seeing his mates depositing a part of their wages, he is tempted to follow their example. Money-orders on other ports are issued free of charge, and the inmates are thus enabled to transmit them to their families and friends without running the risk of leaving the Home in search of a post-office and being waylaid by thieves. Queen Victoria is

SAILORS' HOME.

the chief patroness of the Home, and its management is in the hands of Mr. Thomas Hanmer, under the supervision of the leading merchants and ship-owners of the town, including Charles M'Iver, one of the founders and owners of the Cunard line, William Inman, founder and owner of the Inman line, and J. H. Ismay, one of the founders and owners of the White Star line. These gentlemen are especially qualified by a life-long experience to deal with sailors, and the plans they have carried out in Liverpool for ameliorating the condition of the sea-farer are beyond criticism. Most of the transatlantic steamers dock at the north end of the town, and the present Home being at the south end, a branch has been built in Luton Street, which is within ten or fifteen minutes' walk of the Cunard, Inman, National, Leyland, and American lines of steamers. The branch is five stories high, and the material is brick of different colors—a style growing in English popularity. It has accommodations for one hundred and forty seamen and four mates, with offices for the Board of Trade, reading-rooms, coffee-rooms, a library, and smoking-rooms.

In the river there are four ships devoted to the education of boys for the sea. The *Conway* trains the sons of gentlemen for the position of officers, the *Indefatigable* is intended for poorer boys, and the *Akbar* and *Clarence* are reformatories for Protestant and Roman Catholic juvenile offenders respectively. On the borders of Newsham Park, in a very pretty situation, is the Seamen's Orphanage — a praiseworthy and extensive charity, which is familiar by name, at least, to all who have travelled on the Atlantic. Every ocean steamer collects contributions from the passengers for it, and it is the beneficiary of those mid-ocean entertainments

which are a delightful feature of the voyage "across." Sothern has played Lord Dundreary in a bleak northwester for it, Albani has sung for it amid the bluster and uneasiness of the "roaring forties," and itinerant talent of all kinds, from the low level of negro minstrelsy to the poetic and lyric heights of Ristori, Nilsson, and Salvini, has been volunteered aboard ship in its behalf. Here, again, the management is intrusted to shipowners, captains, and others connected with the interests whose servants the institution is intended to benefit.

Though Liverpool has no cathedral of mediæval splendor, and few structures antedating the present century, it is a handsome and substantially built town, with many irregular and precipitous streets. The later erections indicate the art ambition which prevails among English architects, and combine the utilitarian element with the beauty of a correct and sincere style. The commonest material is a soft yellow or gray sandstone, relieved by pilasters of blue or red granite; the forms oftenest adopted are the Norman Gothic and the Renaissance, with now and then an example of that anthem in stone, the superb Corinthian. There are not many buildings in the world so chaste, harmonious, massive, and forcibly beautiful as St. George's Hall, in Lime Street. It is 500 feet long, and the eastern façade forms a prostylar colonnade, with sixteen fluted columns raised upon a wide sweep of steps from a broad space in front, upon which are equestrian statues of the Queen and her late consort. The southern portico surmounts another pedestal of steps 150 feet wide, ending in a pediment, the entablature of which is enriched by large sculptures executed under the direction of Sir Charles Eastlake, the subjects being allegorical of Britannia's reach and power. Within there is a great hall 190 feet long and 80 feet wide. The ceiling is a continuous arch 82 feet from the floor, elaborately decorated, and supported by two rows of polished granite columns, with statuary in marble panels between them; among others one figure, by Noble, of Sir Robert Peel, another of Stephenson, by Gibson, and another of the late Lord Derby. At the north end of the hall is the great organ, which cost $50,000, and includes a pedal organ, solo organ, swell organ, and choir organ. It has four rows of keys, from GG to A in altissimo, sixty-three notes, and two octaves and a half in pedals, from CCC to F, thirty notes. There are 8000 pipes, from thirty-two feet to three-eighths of an inch in length, and 108 stops, wind being supplied by a steam-engine of six horse-power. The grand hall is used for banqueting and other festivals. The concert hall in another part of the building is an elliptical apartment of very beautiful proportions, with about 1400 seats, and elsewhere under the magnificent roof are the crown court, the civil court, the sheriff's court, the library, the grand jury-room, and the court of the Duchy of Lancaster. The eastern façade is on a spacious square, at the farther side of which is the new dépôt and hotel of the London and Northwestern Railway—a building after the French Renaissance, with a frontage of 317 feet and a height of 81 feet.

To the north of this, upon a column 118 feet high, is a statue of the Duke of Wel-

LIME STREET.

THE EXCHANGE.

lington, cast from cannon captured at Waterloo—a material poetically meet for the perpetuation of the outward form of such a man—and behind the column are three light stone, large, graceful structures, in which are consolidated the popular agencies for the encouragement of art, science, and literature, that have never lacked the most generous patronage in Liverpool. The Free Library and Museum is the farthest west, and was given to the town by the Anglo-American banker Sir William Brown, to whom it cost $200,000. The library department has a reading-room with 50,000 volumes and accommodations for 600 readers, most of whom belong to the industrial classes. It has a free school of science connected with it, and the demands upon it have been so far in excess of its capacity that a new reading-room, doubling the accommodations, has been built in the form of a rotunda upon adjoining ground. The books are not allowed to be taken away, but there are branch lending libraries at the north and south ends of the town, where, upon the recommendation of two householders, volumes are gratuitously loaned for home reading. The museum is furnished with an aquarium, the extensive natural history collection made by the late Earl of Derby, and the famous and priceless Mayer collection of Egyptian, Roman, and British antiquities. Next to the New Reading-room, which is a memorial to a useful member of the library committee, is the Art Gallery, the gift of Sir Andrew Barclay Walker, a local brewer and ex-mayor, which contains a permanent exhibition, including works by all the old Italian masters, Benjamin West, Armitage, David Roberts, Ansdell, Poynter, and Birket Foster.

About a mile away is the noble brownstone building of the Liverpool College, on Show Street, which embodies in its design the hair-splitting but all-potent subdivisions of English society, and consists of three separate schools. The Upper School has two divisions, in which, according to the catalogue, "the pupils are on terms of perfect social equality," one division preparing pupils for the universities, and the other for commercial pursuits; the Middle School gives "a complete commercial education;" and the Lower School "provides a practical education for the trading classes," the distinction between a complete commercial education and a practical education not being very clear to us. Different charges are made for each grade, and allowances are made in favor of the sons of clergymen and younger sons. Thus the full fees for a boy in the Upper School are twenty-two guineas per annum, but a third son is admitted for eighteen guineas, or a fourth son for fourteen guineas.

The grandeur of the town is more apparent, however, in the commercial quarter—in the sumptuous offices and on the new Exchange—than in other directions, for Trade is enthroned, with Cotton for prime minister, in Liverpool, and art is pursued for diversion. The Exchange and the Town-hall form a hollow square, with a fine monument to Nelson in the centre, and the open space is called, from the character of its pavement, the Flags, whereon gather the spruce emissaries of the great mercantile houses to transact their business, with a quiet and

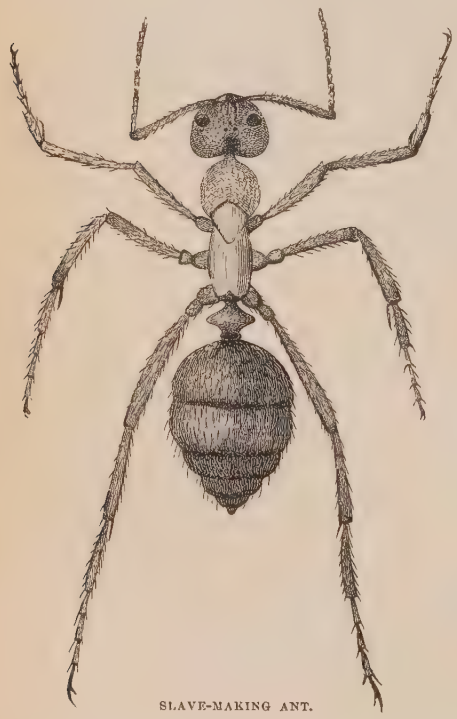
COLLEGE, SHOW STREET.

earnest activity from which the stock-brokers of Wall Street might take a lesson. Between ten and three o'clock the scene is brilliant, and there is always behind it the satisfaction and dismay of those struggles with changing fortune which are hidden in the philosophic and well-bred placidity of the participants.

After the new public offices in Dale Street and St. George's Hall, the Exchange Buildings are the handsomest in town. They cover two acres of land; their style is the recurrent French Renaissance, and the material a pale soft stone. The news-room is unusually splendid. It is seventy-five feet high, contains 1500 square yards, and is lighted by a central dome of stained glass, which sheds warm hues on the profuse decorations.

A prosperous multitude fills this neighborhood. Castle Street, Lord Street, and Bold Street, in the vicinity, are bordered by tempting shops, and the sidewalks swarm with well-dressed pedestrians; but while no English crowd has the color, vivacity, or dramatic impressiveness of the impatient stream on Broadway, that of Liverpool has less provincialism and more energy than any other north of the Strand. The town has lovely suburbs, among others, West Derby, Hoylake, Garston, Hale, Childwall, and Woolton, where the merchant princes live in houses set amid the umbrageous privacy of magnificent parks.

But Liverpool is iniquitous, and the phase of life revealed in Scotland Road is peculiarly revolting, not so much from its poverty and squalor, the sad attendants of all large cities, as from its utter and irremediable brutality. A journalistic friend of mine assures me that the leering, pallid, hollow-cheeked rough of New York is more offensive than his congener in Liverpool; that the former assumes the dress of a gentleman, and speaks of himself as one, while the latter has some sort of a frank recognition of his nature and position. If one is at all worse than the other, it appears to us to be the Liverpool species, however; and an amusement in which he develops himself and has the advantage of the American is wife-beating. A walk down Scotland Road on Monday mornings shows an extraordinary number of women bearing in bandaged heads and black eyes the testimony of the rough's Sunday recreation; and the women fight fiercely and frequently among themselves, no less than four combats of Amazons coming under our observation within half an hour one evening. At every street corner there is a flaring public-house or saloon, and strong drink is consumed in larger quantities than elsewhere in Great Britain. As a natural consequence of this drunkenness, the workhouse, or paupers' retreat, is the most extensive in the kingdom; and Liverpool, despite her prosperity and grandeur, is afflicted with incomparable poverty.



BROWN FREE LIBRARY; NEW READING-ROOM; ART GALLERY.

A CHAPTER IN THE HISTORY OF ANTS.

THE family of ants is ranked the highest among insects. The geologist tells us that this family does not date very far back in the world's history. The lowest forms of the hymenoptera appear in the Jurassic period, but the ants do not make their appearance until the tertiary period, while other orders of insects have been found in the carboniferous era, and some even in the Devonian formation.

The anatomist shows us that the nervous system of the ant is highly organized, that

SLAVE-MAKING ANT.

the cerebral ganglia are well developed, evincing an intellectual superiority over the rest of the insect world.

Eminent naturalists, especially in Europe, have devoted almost their entire lives to the study of these interesting creatures, but in our own country observers have not had the time or patience for such exclusive attention to this family; hence there is much conflicting testimony, especially with regard to the habits of the slave-making species —*Formica sanguinea.*

In the following pages I shall give a brief account of the wonderful wars and conquests over other tribes made by a powerful colony of this slave-making species. It is the result of several weeks' close observation, to the exclusion of all other work, commencing the 1st of July and extending into August.

The nest was in a grove that surrounds the house, and must have contained several thousand working inhabitants. About fifty feet from the nest of red slave-makers was a nest of black ants (*Formica nigra*), and I should judge this colony to be fully as large and strong as that of the red ants.

Externally the two nests did not differ very much. The red ants raised a slight mound, while the blacks had simple excavations about the roots of an oak-tree. These two nests had been under my observation for at least three years, and yet I more than half doubted that these reds were really slave-makers. The blacks were my favorites, being so much more quiet and steady in their habits. A black scarcely ever attempted to bite my hand, even if I used him quite roughly, but the reds would resent a slight provocation. I have had my gloved hand almost covered with the angry fellows, biting and holding on to my glove, simply because I uncovered one of the closed entrances to their dwelling. I have sometimes allowed one to bite my hand, and found it could hurt considerably, and that it left a small purple spot where its mandibles had pierced.

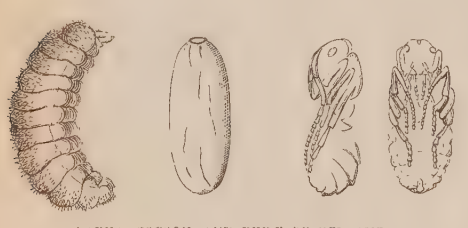
It is stated in scientific works that colonies of the red ant often move, and carry their larvæ and pupæ to other nests. Up to this summer I should have concurred in the above statement, as I had several times encountered a trail of red ants carrying larvæ and pupæ, and had traced the trail from its starting-point, and found only red ants emerging from excavations among rubbish, and so concluded that these ants were simply moving; but a closer and more careful study of their habits has convinced me that this opinion was founded on superficial observation.

On a sultry afternoon, the first day of July, I was lazily sauntering in the grove, when, on looking down, I found, to my surprise, that I was in the midst of a battle-field. A powerful army of red ants had invaded the dominions of the black colony which for three years past I had had a kind of supervision over. I had often brought plants covered with aphides—the immortal Linnæus called these aphides the ants' cows —and stuck the plants into the earth around their dwelling, and had given them sugar, and had driven and carried toads from their nest which were devouring them. In short, I had become very much interested in and quite attached to this colony, but I was powerless to aid them now. I could only look on in wonder and astonishment.

A yard or more around the foot of the tree the battle was raging, and no place for the sole of my foot without crushing the combatants. I found in every instance a red ant pitted against a black; sometimes two red ones against one black, in which case the black was soon dispatched. For three hours I watched the conflict; all around me the combatants locked in a close embrace, rolling and tumbling about, never separating until one was killed, and often the dead victim had fastened with so firm a hold on his adversary that it was with the utmost difficulty that he could free himself from his death-grip.

The sun went down, and the gathering darkness compelled me to leave my post of observation, but as long as I could see, the conflict was as fierce as when I first beheld it. I now picked up several of the warriors, but so intent were they in their terrible struggle that my handling did not divert them in the least. I carried several pairs into the house, placed them under a large oval glass (the cover of a fernery) on a marble-topped table, and watched the conflict.

I found I had ten black and ten red warriors, not engaged in a general mêlée, but each intent upon killing his own adversary. It was fully an hour before the first warrior was killed—a red has at last dispatched his black antagonist, and not satisfied with killing him, he tears his legs from his body and severs his antennæ. After convincing himself that he is really dead, he looks around at the other warriors which are still closely locked in their dreadful embrace, and now he hurries from one couple to another, as if to see where his services are most needed. He finds a couple whose struggles are nearly over—a black is fastened with a death-grip to his adversary's fore-leg. The red hero soon severs the head from the black soldier, and leaves it hanging to the leg of his dying comrade. He now goes to another couple who are still fiercely contending; he seizes the black, and now all three roll and tumble about together; but the black is soon killed, and, as in the other case, his mandibles are locked on his adversary's leg. But this time our hero does not sever the head from the black soldier, but leaves his comrade to free himself as best he can, while he goes to the assistance of a third less fortunate brother, where the black seems to have the better of his antagonist. Here a long struggle ensues, and now another red soldier has dispatched his opponent, and he comes to the struggling three, moves about them in an excited manner, with his mandibles stretched wide apart, waiting his opportunity to fasten them on the black; he finds his chance, seizes him between the thorax and abdomen, and severs the body in two; but the dying black does not relax his hold of the first antagonist, and they die together.



ANT-NEST WITH UNDER-GROUND PASSAGES.

I now leave the fierce combatants for the night. In the morning I find that every black is killed, and four red soldiers are dead, and two others can not long survive. The legs and antennæ and mutilated bodies of the dead warriors are strewn about, every fragment showing conspicuously on the white marble. Out of the twenty, fourteen are dead and two nearly lifeless—only four have survived. I put some drops of water and moistened sugar under the glass for the surviving heroes: two find the wa-

ter and drink. I now repair to the battle-field. The struggle is over—not a black to be seen, but a column of the red invaders is emerging from a large cavity that leads to the numerous galleries and under-ground chambers of these industrious blacks, and each invader is carrying a larva or pupa. I follow the column, which is from four to five inches in width, to the nest of red ants before mentioned. There is a wide opening in the side of this nest, down which they all disappear and leave their burdens, and again start for more plunder. All day long these powerful marauders are engaged in this work. They carry a larva or pupa carefully, and drop it on being disturbed. But what does this mean? Every little while a red warrior comes out with a black bundle, which he carries as carefully as he does the pupa or larva. I stop him to inquire into the matter; he drops his bundle, which immediately unrolls, and lo! it is a lively black ant, apparently unhurt, and, to my eye, no way different from the warrior with whom he was so fiercely fighting.

The books which I have read on the subject inform me that "the red ants carry the pupæ and larvæ of the blacks to their nest, where they rear them for slaves, but they never capture the adult ant, for it would not stay in the new home if they did." But these ants certainly carried a great number of adult blacks to their nest, and I am quite sure they did not run away, but staid and helped to nurse and feed the larvæ. I capture several of the red marauders with their victims, and place them under the glass. The reds now pay no attention to the blacks, but simply try to make their escape. I take larvæ and lay them on a leaf, and put them under the glass also, and place moistened sugar in their reach. Very soon the blacks are feeding the helpless larvæ. I remove the glass cover; the reds immediately run away, but the blacks stay and continue to sip the moistened sugar and feed the young. I hold a magnifying-glass over them, and find the little larvæ raise up their heads and open their mouths to be fed, very much like young birds. I now take the larvæ, together with the nurses, and place them near the nest of red ants. I soon lose sight of the nurses, but the larvæ are quickly taken into the nest by the red soldiers.

LARVA, COCOON, AND PUPÆ OF RED ANT.

By this time I have become so much interested in the red warriors, which I had heretofore rather avoided, that I resolved to devote my time to them, so I keep a daily record of their behavior. This record would be much too long for a magazine article, so I will make extracts from it.

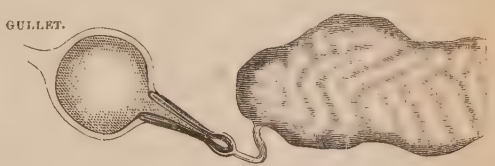
On the 3d and 4th of July the soldiers were very quiet, scarcely one to be seen, as if they were resting after their great raid of the 1st and 2d.

On the evening of the 4th the blacks close the large main entrance through which the larvæ and pupæ had been carried, and compel all the inhabitants to go in and out through another smaller door. While this entrance is being closed, two or three of the red soldiers stand just within the doorway and help to arrange the sticks which the blacks bring. Occasionally a red soldier which has been meandering about the premises comes to the nearly closed entrance as if he would like to pass in; immediately the antenna of one of the guard within is thrust through a small opening, and the one outside touches the antenna with his own, and then walks away and passes through the side door.

After the entrance is closed I remove the covering; this makes a great commotion among the soldiers; a large number rush out and run about in an excited manner. Finding nothing on which to vent their rage, they soon become quiet; some return within, but a good number stay out and assist the blacks in reclosing the entrance. First they bring sticks from an inch to three inches in length and lay them across the opening, not in any regular order; often the end of one of the sticks is pulled in by those within, and the other end left sticking out. All sorts of material is brought and piled on to the sticks—pieces of dried leaves, and a butterfly's wing nearly two inches across, small pebbles and clumps of earth, and one brings a cherry stone; now a red soldier has found a piece of anthracite coal an inch in length and half an inch in thickness; it lies nearly two feet away from the entrance; he walks over and around it, and tries it with his mandibles as if taking its dimensions; he leaves it, and I lose sight of him among the busy toilers; but very soon a large force of workers, both black and red, have surrounded this piece of coal; it is jagged and irregular in outline, thus affording places for the workers to fasten their mandibles. They move it a few inches, and now a tuft of stiff grass is in the way; they drop the coal, and some pass over and others around the tuft; back they come and again seize it, but evidently the workers are of two minds, a part of them are determined to lift it over, and the others are equally determined to take it round

the grass on a comparatively smooth road. After several ineffectual attempts to lift it over, they finally give up and join the others in taking it round. At last the feat is accomplished; this great weight is placed over the entrance, as if to hold the other material in place, and to prevent another such catastrophe—the sudden sweeping away of their work. And I respect their industry and courage sufficiently to leave them for this evening in their imaginary safety.

Toward noon of the next day the blacks open the large entrance, dragging the material with which it is closed to one side; and now the soldiers come out in full force, and march in a straight line to a spot about thirty feet distant; here they diverge, and seem to be hunting over the ground; soon they find a small colony of blacks. The greatest excitement now prevails among the invaders; some are passing down the main entrance, while others are rushing about with extended mandibles prepared for conflict; but the blacks are escaping from another opening a few inches distant, not trying to defend their young in the least. Very soon the marauders emerge, each with a larva or pupa. Those outside, seeming satisfied that there will be no battle, quiet down and join the ranks in ravaging the nest. In less than an hour the spoils are all taken; and the marauders, not satisfied in sacking so small a settlement, again form in line and march directly to another colony a few feet beyond the one they have so recently plundered. They go so directly to this spot that it looks as if it must have been a preconcerted plan. This colony also proves to be a small one, and the inhabitants all flee, leaving the young to be captured. In less than two hours the spoilers have transferred the young to their own nest; and now, apparently satisfied with their day's work, they make preparation to close the entrance—the blacks are clearing the passages which their masters have littered while carrying in their booty. As soon as the passages are cleared, a large force is engaged in closing the entrance, and this proves to be a permanent closing. About the same hour, for several days in succession, the blacks continue to pile material on and around this closed door; but only a few inches distant from this a small opening is being greatly enlarged, which leads to several different galleries.



I supply the ants with coarse granulated sugar; they immediately commence to carry grain by grain to their store-house. Occasionally I notice that an ant carries a grain opposite to the nest and drops it, and then returns to the sugar and takes the next to the nest. I moisten the end of my pencil and pick up the discarded grain, and find it is sand. I now mix sand and sugar together; the sand is left or thrown away, the sugar only is taken to the nest. Some observers are inclined to think that ants do not store up food, and every thing that is taken

FRONT VIEW OF RED ANT'S HEAD, SHOWING ANTENNÆ AND MANDIBLES.

to the nest is for building purposes. If this were true, the sand would not be discarded.

I dissolve sugar with a few drops of water, and place it on an oak leaf; a large number of black ants, and a yellow species about the same size as the blacks, surround the edge of the sirup, jostling and crowding one another, and some that can not find a place on the leaf mount the backs of the others and reach down to obtain a share. These are the nurses that feed the larvæ. Their honey-sacs soon round out almost to bursting, and now they go thus heavily laden to the nest. I notice at the entrance through which they pass a number of red soldiers stationed like a guard, with their heads thrust out, acting as if they would like to stop this line of honey-bearers; they touch them with their antennæ, and sometimes one puts his fore-feet against the shoulders of a nurse, but uses no real violence to detain her. Most of the nurses pass in regardless of these demonstrations, but occasionally one stops and puts her mouth to the soldier's, and feeds him in the same way she does a larva. These may be young soldiers which the nurses are about weaning, but they are so old that I can see no difference in their looks or general behavior from the rest. Huber and other observers state that the nurse assists the young ant to escape from its pupa case, and feeds it for several days thereafter. But it is quite remarkable that a red soldier sel-

HONEY-SAC AND STOMACH OF RED ANT.

dom partakes of the sirup or honey from the leaf, yet he often takes grains of sugar to store away, and will assist in taking a large lump to the nest.

The sluggish oak moth (*Dryocampa senatoria*) afforded the ants a rare harvest. This moth deposits her eggs on the under side of the oak leaf, and she is so sleepy during the day that she will not stir when the leaf is picked from the tree, and she will even submit to being drowned without a struggle rather than make the effort to rouse up and fly. So, on throwing one of these moths near the nest, it is soon surrounded with ants, and before it fairly wakens several pairs of mandibles are fastened so firmly on its body and head that its feeble struggles are of no avail. These moths are always taken into the nest head-first; several times I have turned a moth round just as the ants reached the entrance with it, but they would immediately turn it head-first, seeming to know as well as I did that this was the only way that it could be carried through the narrow passage.

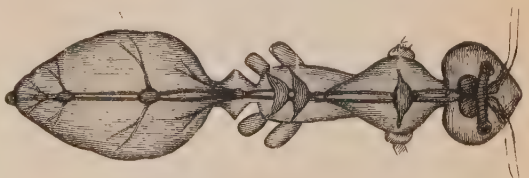
But they do not seem to manifest so much reason in taking an earth-worm to the nest. Several red ants are coming on a gravel-walk with a worm about three inches in length; they move along the walk very well indeed, all working in concert; but soon they reach the border of dwarf iris, and are brought to a stand-still by making a loop of the worm round a stem of iris. about the same number of ants pulling at each end, neither party knowing enough to let one end drop. They try to raise it over the plant, which is about six inches high; when they get nearly to the top, something always happens to bring it down to the ground. This is repeated full twenty times; at last the strongest party are at one end, and now they soon pull it round the iris, and quickly disappear with it in the nest.

But the most remarkable feat of this kind was performed by another colony of ants—a species that I do not know—a trifle longer but more slender than *F. sanguinea*. It has a black head and abdomen and a russet-brown thorax, and seems to be the most intelligent species which I have observed. This species also has its nest in a border of dwarf iris, about fifty yards from the slave-owners. Some five feet from the nest I notice a number of these ants congregated in the grass pulling away at an earth-worm. About two inches is unearthed, the remaining part is in the ground. Several ants are removing the earth from around the worm, while many others are holding on to it to prevent its crawling back. It is nine o'clock in the morning when I first observe them. At three in the afternoon a little more than four inches is unearthed, and two inches or more of this is dead. There is considerable excitement around the nest; they are evidently making preparations for storing this huge monster. A company are carrying a stick into the nest as thick as my little finger, and over an inch in length; they soon return and take several smaller sticks, as if they were building a new apartment.

It is now four o'clock, and their progress is so slow with the worm that I fear I shall not see the termination of the unearthing, so I take a small pair of forceps and assist the workers in pulling the worm out. There were about two inches remaining in the earth, and I found I had to exert a little strength in extracting it. This end is still alive and squirming. The worm is very large, full six inches in length. Much excitement now prevails among the workers, they act very much like the slave-makers when they are capturing another tribe. In less than two minutes from the time I extract the worm a large force of workers has come from the nest; not half the number can assist in carrying the worm at the same time, but they act as relays. About an equal number are at each end, fewer toward the middle. They all pull in the same direction; this makes a loop of the worm, and they must carry it through grass all the way. A large number are just in front trying to clear the road: grass is pulled down, small sticks taken out of the way. I lay a small stick three inches in length in their path; it is immediately removed by the force in front. But now they have become hopelessly entangled in the grass; they can neither raise the worm nor pull it through; at last they cut it in two; about two inches of the dead part is taken off and speedily carried to the nest by a part of the workers. The remaining portion of the worm contracts, so that it is not much more than three inches in length; and now they move along rapidly and soon have it housed. In less than five minutes after it is taken into the nest not an ant is to be seen; the door is closed from the inside. This is the only species which I have observed that closes the entrance in this way.

One other exploit of this colony, and I

ANTS ATTACKING LARVA.



will return to the slave-makers. I find a full-grown larva of *Thyreus abbotii;* it is nearly three inches in length, strong and robust, and, like nearly all of the sphinges, has a thick, tough skin, and when it is disturbed is the worst-acting member of the family. I place it on the nest of this colony of ants, and they attack it in large numbers; they mount on its back and hang to its sides. The larva thrashes about and throws the ants right and left, but the plucky fellows are back again in an instant. The larva now tries flight on the smooth carriage drive. This gives the ants the advantage; they fasten their mandibles in every available spot. Again the larva stops and thrashes violently from side to side, and dislodges a good many, but not all. Again it starts at a rapid rate, most of the ants following, but some turn back and go to the nest as if discouraged. The larva now comes to a little heap of débris washed here by the rain, and takes refuge under it. This sweeps all the ants off, and they seem puzzled for a moment; but very soon they find where it is, and commence taking the light material from over it and throwing it to one side. Soon they reach it, and the larva, again feeling their mandibles, rushes out, and goes a few inches to another pile, where it again seeks refuge. By this time many of the ants have returned home, only about a dozen remaining; but these soon unearth it, and now it goes very fast a little way, and brings up against a wall of brick set edgewise in the earth to prevent the grass from encroaching on the drive. Instead of going over this wall—only an inch or so above the ground—it is trying to get its head under something. Only seven ants now remain, but they are getting the advantage of the larva, and slowly worrying its life out. Every little while an ant comes across the drive from the nest, as if to see how his comrades are getting on, and usually stays and assists in trying to kill the game. By the time that it is nearly dead a large force are on hand, and they drag it to the nest—some fifteen feet distant—more quickly than they did the earth-worm.

On the morning of the 9th the red soldiers start in full force, and keep in line until they have gone about twenty yards. Here they disperse, and seem to be hunting over the ground; but this proves a fruitless adventure, and they return home in line empty-handed. In an hour or so they again form a line and start in another direction, this time halting about thirty feet from the nest among some dry oak leaves. Here they attack a colony of yellow ants apparently as large and strong as themselves; but they prove to be great cowards, and skulk among the leaves, and flee in all directions. Probably not more than a dozen are killed. The nest does not prove to be very rich in larvæ and pupæ, for in about an hour it is plundered. Here, too, as in the case of the black ants, several adults are carried to the nest unhurt. The next day after the raid the yellow ants return to their ravaged home, and occasionally one comes near the nest of the red warriors, attracted by the sugar and honey with which I keep them supplied. It approaches very timidly even when its own species and the blacks are feeding alone, and runs away each time that an ant turns from the honey to go to the nest, as if afraid of pursuit. And I find that even the yellow ants will drive it away if they come in contact with it. But on two occasions I saw this yellow ant capture one of its own species that was feeding and domesticated with the reds, and carry it to its own nest. I think these two ants were nurses that had been so recently captured by the reds, and they were recognized by this yellow worker.

EXTERNAL ANATOMY OF RED ANT.

The black and yellow ants never accompany their masters in their raids on other tribes, but stay at home and clear the passages, open and close the entrances, and

NERVOUS SYSTEM OF RED ANT.

nurse the young. I tried many experiments to test the intelligence of the ants, which I must omit, as I wish to dwell more especially on the feature of their invasions.

On the morning of the 18th the soldiers make a long march; they go directly to a line fence, some thirty yards distant, which separates the grounds from a neighbor's garden. A board about six inches wide runs along the ground, to which pickets are attached. When the ants reach the fence, they all go through a small opening on the

ground, about three inches in width. The line has to converge here in order to go through, and sometimes considerable confusion seems to prevail, for more congregate than can pass through readily. It seems strange that they do not go between the pickets, for they are thickly scattered on the board just beneath. They soon pass out of my sight after going under the fence. In about three hours they begin to return with larvæ and pupæ. Evidently they are having a battle with the blacks (*F. nigra*), in which many are still engaged. Every little while a red warrior comes bringing a black and red soldier locked together. The black is dead, and the red crippled and unable to free himself from his foe, and so they are taken together to the nest. This looks as if these red marauders were trying to take care of their wounded soldiers, for I have never seen them take a dead black ant to the nest except when it was locked to one of their own soldiers. This battle is simply a repetition of the one on the 1st of July.

On the 23d of the month the red warriors attack a different species of black ant, larger and more robust than *F. nigra*. This proves to be a very large colony. The nest is among the grass in the grove, about sixty feet from the nest of the invaders. I was not aware of its existence, although I must have passed over it frequently.

It is toward evening when the marauders come down upon this large peaceful colony, and the inhabitants flee in every direction, not making the least exertion to defend themselves; the grass is fairly black with the fugitives. There are some ten or a dozen openings in the space of a yard, through which they are pouring out. The red ants simply dance around the openings with extended mandibles, scarcely even attacking the fugitives, yet seeming excited and impatient to get to the nest, which is impossible for them to do while so many are coming out. Finally they get possession of the nest, and commence transporting the pupæ to their own dominions. I see no larvæ, and most of the pupæ are naked; seldom is one inclosed in a cocoon.

It is growing quite dusk, and still they work on, but the line is evidently thinning. At nine o'clock I take a light and find a very few engaged in work. At six in the morning I still find a few carrying pupæ, but by eight o'clock the force is all out; the line is from four to five inches in width, and extends from one nest to the other, about an equal number moving in each direction—the empty-handed coming toward the invaded nest, and those laden with plunder going to their own dominions. As soon as they deposit their spoils they resume the line of march. All day long this line is unbroken, at dusk it is considerably thinner, and by ten o'clock in the evening all have disappeared.

During the entire day I saw no black ants around the nest, but every little while a marauder would emerge with an adult black, which it carried to the nest; and they captured a large number of young ants that were still soft, and of a grayish color—not yet turned black. When I disturbed a captor with one of these, it dropped it, and the young ant would try to hide under something, and remain quiet until picked up by another warrior, when it would crouch and roll itself up in a ball, so that it could be carried just as easily as a larva or pupa. It reminded me of a cat carrying a kitten; the young ant behaved very much like a kitten when carried.

On the morning of the 25th a few of the marauders are around the invaded nest, going in and out of the various openings as if to make sure that nothing is left; but they soon return to their own dominions empty-handed, and visit the ravaged nest no more.

During the day I keep watch of the plundered nest, and occasionally a black ant comes timidly up and cautiously moves around; finally it ventures into one of the openings and disappears, but it soon comes out and walks away. Toward night of the same day a large number of the black fugitives return to their home, not in any regular order, but from various points, and each is carrying a comrade which he takes into the nest. I can offer no solution of this; there was no battle, and these are not wounded soldiers.

In most nests which I have observed there seem to be two sets of workers, one larger than the other, the smaller seem to be the true nurses; it was these that were carried back to the nest. But why they did not return in the same way they left is one of the mysteries of ant life.

The returning fugitives all disappeared through the same opening, and in the morning this was closed, mostly with sticks and clumps of earth. I remove the covering, but not an ant appears; it is fully an hour before they venture out, and now a dozen or more come out, and quickly reclose the entrance. A small place is left open, so that one at a time can squeeze in and out. I place sugar and various things about the nest, but they store nothing away, and eat sparingly.

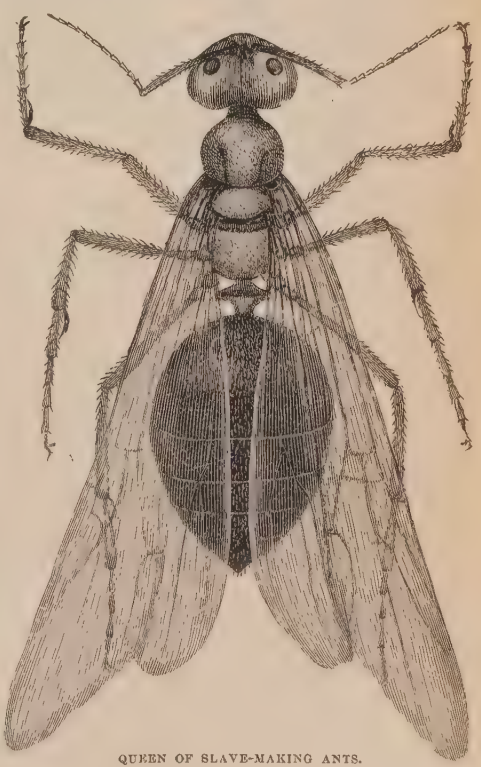
On the 3d of August I notice a very curious proceeding on the part of these red warriors. Their nest extends into the edge of a tulip bed, which is bordered with the iris before mentioned. The bed is about three feet wide, and in the border just opposite is a nest of tiny yellow ants, with which I am unfamiliar, so small that they are scarcely distinguishable to the naked eye. They are scarcely longer than the little red ant

which is often such a pest to housekeepers, but they are broader and more robust than this species, and of a light yellow color. From fifty to a hundred red marauders assail the nest of this tiny species; but the openings are so small that they can not get to the nest, except as they go to work and enlarge them, and this proceeding is fiercely resented by the little ants; sometimes three or four will attack one of the invaders, fastening themselves to him in such positions that he can not reach them with his mandibles, and they hold on with such pertinacity that he finally becomes fairly frantic; he doubles himself up and rolls about over the ground, trying to reach his tiny tormentors; and now one of his comrades, attracted by his strange behavior, stops and looks on, and walks around him, as if to learn what all this tumbling means. Seeming satisfied, he picks him up and carries him toward home; while he is being carried he is quiet. I take him away from his comrade and put him on the ground, when he again resumes his tumbling, until picked up by another and carried into the nest, as if the public highway was no place for such contortions.

I put several of the red warriors, with this tiny species hanging to them, in alcohol; the little things do not relax their hold, but die holding on to the big marauders.

Sometimes an ant will continue work with one of the little things hanging to his antennæ, but more often they stop work and start for home when one is fastened where it can not be reached; they are not carried home except when they roll about.

The invaders work for several hours, greatly enlarging the openings, and at night return home with no spoils. On the following day a few resume work, and keep steadily at it all day, and enlarge several openings, through which they can pass in and out readily.



A rain-storm now comes on, lasting three days. During the storm the ants remain closely housed. On the morning of the 8th a dozen or more resume the work of excavation. By this time they have killed so many of the little ants that they can work without much interruption.

What they are after is to me shrouded in mystery; they certainly can not want the larvæ and pupæ of such a tiny species as this! On the 9th they still continue work, and on the morning of the 10th the treasure is unearthed, and proves to be a great number of large winged females, longer than the red marauders, and with large full abdomens, so heavy that it takes two of the captors to drag them to the nest. Many of the tiny workers have congregated about them, trying to defend them with their lives. But the great helpless females allow themselves to be taken captive and dragged away without offering the least resistance.

There must have been several hundred of these large females, and of course they had never seen the light. Probably the little workers would have released them before this if their home had not been assailed.

I soon filled a small vial with the females which I took from the captors, and this was only a small proportion in comparison with what they carried to the nest.

At the same time that these females are being taken captive a portion of the army are attacking another species of ant, about as long as themselves, but much more slender and of a dark brown color. The nest is beneath a gravel-walk not more than ten feet from the nest of the assailants. As soon as they are aware of the danger which threatens them they come out in great numbers, and the nurses have pupæ in their mouths. This seems to puzzle the marauders, and they allow most of them to escape, but occasionally one tries to take a pupa from its nurse, but she will not give it up, so the cruel invader tries to take both nurse and pupa to his own dominions. But this proves a difficult proceeding, for she will

QUEEN OF SLAVE-MAKING ANTS.

not roll up and be carried peaceably, but struggles and holds on with her legs to various things with which they come in contact. I turn monster, and pick up one of these devoted little creatures, and handle her quite roughly, but she will not drop the pupa unless I pinch her quite smartly; then she drops it in my hand, and bites fiercely, to which I patiently submit. When she has chastised me sufficiently, she picks up the pupa quietly, and tries to make her escape.

These ants move very gently, do not seem at all excited or hurried, and as soon as they reach the grass and clover they mount a blade of grass or stem of clover, and there they remain perfectly still, holding the pupa. The assailants pass beneath them, hunting over the ground, but not one, so far as I saw, was captured from a stem of clover or from a blade of grass, and sometimes a blade of grass would bend quite low with its burden.

The assailants, satisfied that the game is gone, return to their own dominions. In about an hour from the time these ants were driven from home they begin to return, coming slowly down from the grass, where they have so patiently waited until the invaders were gone, and carry the pupæ directly back to the same opening from which they came out.

A REPORTER'S ROMANCE.

I.

WALTER CONDON and I—reporters for two morning newspapers in the city of New York—were nearing the end of our long round of visiting police stations in search of news, as the clocks were making ready to strike twelve. Turning out of Pearl Street, where the bitter wind of this January midnight was driving fine icy snow into our chilled faces, the green signal lanterns before the door of our last station showed us a hospital ambulance standing there. Hastening to enter, we found, lying on the floor of the back office, with an ugly wound in his head, a man whose face we had often seen in the cells for thieving, and whose business was to peddle sweetmeats among the concert saloons and sailors' resorts existing in such terrible abundance between Chatham Street and the East River. The surgeon thought the man would not live, but ordered him removed to a hospital. At that moment the front-door was opened timidly, and a small voice asked, "Please, Sir, is he dead?"

"No, he 'ain't croaked yet, but he will 'fore long," answered the glum door-man. Then, seeing the scared, pitiful little face, he added, more kindly, "What do you want with old Baldwin, anyhow?"

"I dun know, Sir. He was my uncle, and Big-nosed Jim told me he was killed." And she began to cry.

Now there was something so uncommonly friendless in the appearance of this ragged, bare-headed little girl crying silently by the door, not offering to come near the unconscious man, nor wailing loudly, as is the custom of street children in trouble, and something so pathetic in her soft voice, that we were all interested, and began to question her, but had got no farther than to find out that her name was Elsie, and that she had lived with Baldwin for a long time, but she thought not always, for she remembered playing with a beautiful young lady in a fine house, "where it uz allers warm, you bet!" she exclaimed, spreading her blue hands out before the great coal stove, when the door opened again, and a policeman pushed in before him an old hag, blear-eyed, half dressed, and furious with anger. At the sight of her the little waif broke her story short off, and crept tremblingly over to the farthest corner, begging us piteously not to let the woman take her.

"Arrah!" shrieked the beldam. "Jist let me get a hold of yez wunst, and I'll—"

But her threat was lost as she was hurried back to her stone bedroom. Then the dying old sinner was carried to the ambulance, and it rattled off to the relief hospital, where Baldwin's name was placed upon the death-roll before another sunset.

Meanwhile Condon was trying to comfort the girl. Elsie told him about a long journey, and that afterward Baldwin had made her go about with him at night and sing in the saloons, had forced her to beg for nearly all her food and for the rags she called clothes, and to pick over the ashes in street barrels for gleanings of coal to burn in the broken stove that warmed his garret. Elsie explained her terror in the presence of the woman by saying that Baldwin had sometimes left her in the beldam's charge, when she had been beaten shamefully. Condon always thought this woman could have told him more about Elsie, but not feeling it strongly at the time, he never afterward was able to discover her.

The story Walter won from the little stranger touched him deeply, used as he was—and as we all come to be—to the woes of the poor in the metropolis; and most of all when, her confidence fully won, she said, simply, "I'll sing for you," and began a pretty melody, while we all listened to the sweet tones so strange in a police office; then, I think, his mind must have been decided, for when the bluff sergeant called out, "Well, what shall be done with the kid?" Condon's answer was quick, "I'll take care of her."

"To-night, Tom," he explained to me, "I think she had better go to a hotel, and to-morrow I'll take her home."

"And a fine time you'll have of it!" was my thought; but I said, "Oh, certainly." So off we went to a small German hotel we knew of, and put the little waif to bed.

"PLEASE, SIR, IS HE DEAD?"

Walter lived up in the Eighth Ward, with an aunt, who was a good old soul, but had rather more acerbity mixed with her affection than any of us liked. It was a snug little home, though, and the young man had good reason to suppose he should succeed to its ownership.

I did not see Condon until the following evening at the Press Club, and I was very anxious to know how he felt about his generous act, after sleeping on it, and, moreover, how he had introduced his ward to his aunt. I rather expected the complete disappointment of my enthusiastic friend's plans. He told me all about it at once. Elsie had been rather distrustful of him in the morning, but took a childish delight in the new clothes he had bought for her.

"She only needed some color in her cheeks," he averred, warmly, "to make her a positively pretty girl. But her comfortless look was an advantage in one respect, for it softened a little the muscular heart of that excellent old aunt of mine, and I believe Elsie will really win her. By Jove! I hope so."

Elsie did win her, and although at first her ignorance and street manners annoyed the old lady a great deal, she was partly coaxed and partly forced to be patient with the girl, and Elsie rapidly refined.

II.

Not long after this I left New York and went to California for five years. I could tell you some stories about that too, if I had time; but no matter. I kept up a sort of connection with the newspapers through correspondence, and therefore, when my property in San Francisco was burned, and I came back as poverty-stricken as ever, I had little difficulty in finding a position on the press, and was fortunate enough to get into the same office with my old-time chum.

Condon had hardly changed his status. He was the regular Wall Street reporter now, and on a salary, but spent most of his energy in writing critical essays and in the study of political economy. For politics, in the abstract, he had a profound admiration; for ward caucuses, party machinery, and Congressional wranglings an intense

disgust. He therefore might have occupied a far more prominent place in metropolitan journalism if he had not persistently chosen to keep this position, which suited him and favored his pet study. He seemed indifferent and indolent, and was so in many respects, for he loved quiet and his mood; yet, when an emergency rose, he could summon tremendous activity. He carried about with him always much latent power.

Changes in his affairs contributed to this gentlemanly and studious neglect of stirring work. The death of his aunt left him with the little house in which they had lived and a comfortable income, and a staid old lady became his housekeeper.

As for Elsie, she had become the pet of the household, and Walter always spoke of her as his little sister. His aunt had left a special bequest providing for her education, and she was happy at a boarding-school up the Hudson.

So affairs went on. The purity of our September climate faded into sere October, and chilling airs bore premonition of winter. One day we were all in the office, awaiting assignments for the afternoon, when the hall boy brought in a visitor's card. The editor glanced at it, grumbled at the interruption, and tossed it toward Walter, calling out roughly, "Go see what she wants, Condon."

Walter growled some anathema on the head of the whole female sex—I think we were all in bad humor that morning—and took the card. I saw it:

Miss Hilda Brand,

written in a firm, upright, feminine hand, with no waste of ink in flourishes. Rising indolently, he sauntered out to the anteroom, leaving the door ajar, and thus permitting a glimpse of the lady—a rather young and slender woman, with a sweet and serious face, no dimples nor long eyelashes, but a clear complexion, gray eyes full of purity and earnestness, and thin lips expressing self-reliance and strength. She was very plainly attired in dark clothing, and her simple hat was concealed in the folds of a veil.

Condon bowed in the attitude of sincere respect he held for all women—an attention to their every word that had captivated many a one by its subtle flattery—and asked how he could serve her in place of Mr. Brennell, whose excuses he presented.

"Thank you," she replied; "I am seeking employment as a stenographer. I have had experience in taking the proceedings of Congressional committees at Washington, and hope to be able to avail myself of it in newspaper work here. I can refer—"

"It's not at all necessary," Walter interrupted. "Reporting for us is a question of present ability rather than of antecedents." He was looking at her sharply, and I thought I saw her lip tremble at his austere and business-like manner. Perhaps he saw it too, for he added, more kindly, "We have never made use of any feminine skill, but if you will wait a moment, I will consult with Mr. Brennell."

It was soon understood among us that the fair stenographer was to be a member of the staff. She came, and did her work well. We readily got acquainted with her, but could never be familiar at all, and I believe that men generally disliked her. She was rather too mysterious to please us. Condon seemed to pay less attention to her than any one else; but one dark night when she had been kept until ten o'clock, and it had come on to rain, Condon remarked: "I will give you the shelter of my umbrella to the car, Miss Brand," and went in spite of her protest—a piece of solid audacity three reporters I knew of had ignominiously failed in within a fortnight.

Condon had a way of quietly taking possession of every lady he chose to speak to, as though he knew precisely what they wanted to do and ought to do far better than they did themselves; and this firm, quiet, polite persistence they generally found irresistible, knowing he would not be irritated by a rebuff.

One day there was to be an important inquest at Newark upon the causes of a fatal boiler explosion some days previous, and Miss Brand was sent down to take a shorthand report of the proceedings. She was expected to return between nine and ten o'clock in the evening. It was the 17th of March, and a cold, snowy day—the ugliest end of winter. After our early evening dinner Condon went over to Jersey City on an errand, and returning about nine o'clock, heard at Cortlandt Street that a railway train had fallen through a bridge on the Meadows. He glanced at his watch. "It's her train," he said to himself, with a chill feeling about the heart, and, hastened by impulse rather than controlled by purpose, he ran across to the next wharf and leaped upon a boat just leaving the slip.

Now he had time to think. The night was cold, and the icy wind from down the bay swept before it snow and sleet, which rattled on the roof of the cabin, and slammed the doors with changing gusts. The storm was dense as a fog, and Condon found himself chafing with a nervous haste quite unusual to him, as the ferry-boat stopped again and again in the ice, whistling her hoarse warning. He went out on deck and peered into the murky night, but got little consolation. Vexed with himself for feeling so much concern, it never occurred to him that ordinary humanity would require him to go on such an errand as this; that the fraternal interest of journalistic association would demand that he do what service he could to

a sister reporter. He only saw possible harm to her individually. He called her "Hilda" in his thought, and not "Miss Brand," as always hitherto.

An engine and some cars were waiting to take the surgeons down to the wreck, and upon representing himself to be a reporter, Walter received a grudging permission to stumbled on with all speed, and presently thought he saw some one ahead. He hallooed, but the wind drowned his voice, and he seemed to gain nothing upon the figure, until suddenly it disappeared, and the next instant, so deceiving was distance in the snow, a woman rose up from almost under his feet.

"HIS OVERCOAT WAS OFF IN AN INSTANT, AND WRAPPED AROUND HER."

go also. The short ride ended, Condon was the first to alight and hurry toward a fire built by the ruined bridge, for there was no shelter near except a single overcrowded coach. He scanned the group of figures around the blaze. Miss Brand was not among them. Trembling with excitement, he caught a brakeman's arm, and hurriedly described her.

"She's all O K, Sir!—not a scratch—I know her—just started to the city down the track—couldn't hold her—"

Condon waited to hear no more, but started to follow her. The track was rough and slippery, the sleet was changing into steady snow, and the darkness was intense, but he

"Hilda!" he exclaimed.

"Who is it? Mr. Condon? Oh, I am *so* glad!"

"Are you hurt?" was his anxious question.

"No," she said, "but very tired;" and she clung to his arm, her form shaking with fatigue and excitement and cold. His overcoat was off in an instant, and wrapped around her. Then he supported her firmly, and started on, for she would not go back.

"There are no roads on these meadows," he said. "We must walk back all the way to the ferry, for it will not do to stand still in this storm. Can you endure four miles of this?"

"With your help, I think so," she replied;

and they struggled on. Suddenly she stopped. "Your report, Mr. Condon! What will you write? You must go back."

He stopped also, but to fold his unwieldy Ulster more closely about her slight, thinly clad form.

"I did not come for news. I came for you."

She only held more tightly to his arm, murmuring, "I was pretty badly frightened," and walked on. Not far, however, for that moment they descried the relief train returning to the city with the wounded, and, managing to make the engineer hear their cries, were taken on board.

III.

The rest in the cars and on the ferry-boat restored the girl so much that she insisted upon walking up to Printing-house Square, where she made haste to hand in her report of the inquest at the counting-room. Then she turned to go, holding out her hand at the door to Walter in an embarrassed way, and saying, "I can not thank you properly for your kindness, Mr. Condon; and now I must bid you good-night."

"Not in the least," objected Walter, stoutly. "I shall not be so thoughtless as to let you go home alone at this hour of the night. Why, it's twenty minutes past eleven, and St. Patrick's night too, when even I used to feel squeamish at going about alone."

"But you *can not* go with me, and I don't wish you to," she said, trying ineffectually to escape.

"I shall not consent to leave you unattended this black night," he answered, earnestly; "and if you persist in your refusal, you may be sure I shall not lose sight of you until I know you are safely at home. And now we must have a cup of coffee."

The commanding way of the man conquered. She allowed him to put her arm through his, and went with him. But she was silent all the way; and when the café was reached, and he had again refused to let her go away into the great city by herself, she dropped her face into her hands and sat the image of misery. Condon, utterly unable to comprehend, regarded her without a word. Suddenly she lifted her face and spoke to him: "Mr. Condon, once more, will you not leave me to go alone?"

The noise of a fierce scuffle in the street penetrated the room at the moment. The pleading look in the sad face, which had caused him almost to waver in what he was sure was a right resolve, changed to one of terror, and Walter had only to point to the door to enforce significantly his final refusal: "To-night?—no."

"Then I must tell you something which I never should have confided to you if I could have helped it. Yet I do want your—somebody's aid—oh, so much! You know we used to live in Washington, and that my father was an editor there. He lost his money and place through bad men, and fell sick; and then— Oh, listen! it's striking twelve o'clock. Come, we must hurry," and she sprang from the table. "You must not ask me where I am going," she went on, excitedly, "but only go with me. And will not you be afraid? I should hate to have any harm come to you."

He was puzzled, and glanced at her face as he assured her of his composure. The wavy brown hair was blown back from the broad forehead, where some delicate wrinkles were drawn in anxiety over the gray eyes, and the shapely lips were set with intense purpose and courage. It was such a face as seems to lead a forlorn hope.

The snow and sleet had ceased, but heavy clouds still scudded overhead, and a biting wind raced through the streets and spun giddily round the corners, shaking with angry hand the endlessly creaking signs, rattling the locks of the heavy doors, drifting the snow into banks, pounding and battering at every obstacle.

Hilda was poorly clad for such a night, shivering in spite of herself; and when Walter laid his arm around her slender shoulders and almost carried her along, she did not resist. He was going straight down to Fulton Ferry, supposing she was on her way to Brooklyn; but she made him turn up empty Nassau Street, which rang with their quick tread above the roar and rattle of the gale, and then guided him eastward block after block.

"Do you know where you are going?" he interrogated at last, in surprise.

"Hush! you will see," she answered, in a low voice. "Please don't speak to me now—and you may never want to again."

After that he asked no more questions, but applied himself wholly to taking care of her, keeping all his senses on the alert, while she hurried him farther and farther from the brilliant thoroughfares, deeper and deeper into a wilderness of tortuous narrow streets, where the sun can scarcely penetrate to the pavements even at high noon, and the most brilliant moonbeams fail to sound the fathoms of darkness that lie damp and cold between the tall warehouses. Above, perchance, the moonlight silvers the edge of the cornices; below, the heavy doorways are dimly outlined at intervals by the flickering street lamps that paint a long line of bright dots upon the darkness. Here and there glows a red eye out of the gloom, and behind it shines the entrance of a drinking resort for the desperate and squalid inhabitants of this nether side of the city. Into two or three such places Hilda led the young man for a moment, while she eagerly searched for some one—whom Walter could only surmise. Once or twice he was glow-

"SHE WAS HOLDING THE HEAD OF THE INSENSIBLE OLD MAN ON HER KNEE."

ered at by faces which he remembered very well from his old night-reporting days as those of cut-throats. He knew they were approaching the river, and this meant a constant increase of peril. So when Hilda turned swiftly down Oak Street, and, in response to his "Where now?" said, faintly, "To Water Street. Will you go there also with me?" (go with her!—he would have gone to the end of the world if she had asked him then),

he bethought him of a ruse, and answered, gayly, as they were passing a police station, "I shall certainly do nothing else; but I would like to run in here and light my cigar, if I may."

He lighted his cigar, to be sure, but his real object was to ask for a detective to follow them closely. Then the two pursued their zigzag way, buffeting the wind.

Few people were in the streets—it was too blustering for that—but from all the many drinking shops came sounds of rude music and riotous revelry. Even Hilda could not help remarking how frequently they met policemen.

"Do you see that half-shut door over there?" and Hilda pointed it out. "I must look there. If I do not find him, then—I don't know what I *shall* do."

They crossed the street, and were just under the large red lantern, when a great commotion was heard within, the door burst open, and an old man was cast headlong to the pavement by a blow from a young ruffian, who, following to complete his work, was met by so stunning a counter-blow from Condon as stopped his interest in that quarrel at once. His companion, seeing him fall, leaped at Walter, but met instead the detective's club.

It was all over in half a minute, and Walter turned to Hilda. She was holding the head of the insensible old man on her knee, and with her handkerchief stanching a cruel wound in his forehead. With a face as white as his, but calm, with tender industrious hands, and a solicitude regardless of public gaze, she bathed the old man's bleeding face, and tried to restore animation to the wasted hands, while others put drops of brandy between his lips. Walter knelt beside him, and told her the heart still beat. But Hilda only moaned, "Oh, father, father, come back to me! come back to me!"

By this time a stretcher was brought, and laying the old man upon it, two officers carried him to the police station, setting him down in the back-room—the self-same station and the self-same spot where old Baldwin had lain five years before.

A surgeon had been telegraphed for by the police, and, with the hospital ambulance, was waiting at the station when the little procession entered the double doors. The surgeon pronounced the wound not necessarily dangerous, and very soon brought back consciousness, the old man opening his eyes first on Hilda, to his evident astonishment.

"Father," she said to him, softly, "you have been hurt; you must lie quite still until we can take you home."

Meanwhile Walter was saying to the police surgeon and the grave-minded officer behind the desk, "That is as much of the story as I know. Doubtless I shall find out all the rest from the young lady very soon. I will have the old gentleman taken to my house: there, surgeon, is the address for your driver. Meanwhile I will be accountable for the appearance of Miss Brand and myself as witnesses against the prisoners if the old gentleman cares to prosecute them." Then turning to Hilda: "This gentleman"—for he would not betray what might be her confidence—"this gentleman must go to the hospital, and we must go with him. He will be taken in the ambulance, and I shall get a carriage for us." Where the "hospital" was he forbore to explain.

Whereupon he went out, and returning presently, helped tenderly—in spite of a slight revulsion of feeling—to lay Mr. Brand into the springy couch of the hospital van, after which he handed Hilda into the carriage he had brought, and, directing the driver to follow the ambulance, seated himself beside her.

"Miss Brand," Walter asked, gently, in a moment, seeing that she was composed—"Miss Brand, you began to tell me something about yourself when we were in the restaurant. Will you continue? I am better prepared to hear it now."

"Yes," she answered, wearily. "It is better you should know all now."

Then she related to him rapidly the chief points of her history. How her father, an educated man, had been editor of an influential newspaper in Washington, but becoming involved in unsuccessful political schemes, had lost his position; how misfortunes rapidly followed, and how her father had resorted to wine and the gaming table to drown his sorrows, until he had impoverished his family, which then consisted of Hilda and another daughter much younger than she, whose birth Mrs. Brand had not survived. They had to give up their home, and were very unhappy. It was a sad story, and Walter protested against hearing any more, seeing the pain it gave her to tell it. But she would not cease.

"It was only a little while after that that my sister and I went out to do some errands one pleasant afternoon in October. She was four years old then, and I took her every where with me. It was nearly dark when we got through, and hurrying home, I left sister a moment with a playmate, telling her to come quickly. Our house was only two squares away, and I had no fear of her not knowing the way. They told us she really did start after me almost immediately, but I never saw her again. Where she went, or whether she is even alive, none of us know."

Hilda spoke the last sentences in so low and sad a voice that Walter could hardly hear her.

"Papa clings to the hope that we shall find her some day; but I think she is dead."

Paralyzed at first by the blow, precious time was lost before active search was begun, and then no trace could be found, the only thing discovered being that an Irishwoman, whom Hilda had once discharged from her employ for stealing, had disappeared from Washington about the same time as the child. But search for her had proved equally fruitless. Walter's breath came fast as there rushed upon his recollection the memory of Elsie, and of the beldam who wanted to take her away from the police station.

"Finally," Hilda went on, in her weary voice, "our money all gave out, so that we could not pay any more detectives; people became tired of sympathizing with us, and we had to bear our sorrow in decorous silence. Then papa— Oh! I can't tell you all about it. You *must* know how terrible it was, and I *can't* explain. I shall cry if I do."

Again Walter bade her not to try. Nevertheless she did, telling him, with passionate earnestness, how her father had changed from the proud, handsome man into the decrepit old drunkard; how she had resorted to stenography—her amusement in earlier years—for a livelihood; and what a wretched weight of sorrow she had borne in loneliness and degradation.

"One day last September," Hilda continued, gently withdrawing her forgotten hand from Walter's—for he had taken it in an assuring clasp when once she had been sobbing with the misery of her recollections—"papa came home more like himself, and startled me by telling me that he believed our lost darling was in New York, and that he was resolved to go himself to seek for her. I pleaded with him, but it was of no use, and I could only persuade him to wait a few days until I could go with him. He had obtained some money by selling his last little piece of property. Well, we came to New York without any plans, but by a fortunate accident found a good boarding-place. Papa was hopeful, and said he was on the track of my sister, but I always doubted him. He would stay at home all day, but go out in the evening; and one night he did not come home till morning, and then I could see that he had been drinking again, and had lost all his money. I begged him not to go away the next evening, but he did, so I followed him, and persuaded him to come home. In that way I learned his haunts, where he went to gamble, and often I have been in those dreadful places at midnight when I could not induce him to leave earlier. I am afraid he will never give it up. Oh, father, father, how could you sink so!"

Hilda's brave voice was lost in this despairing cry, and she had no more than time to recover her self-possession before the cab stopped.

IV.

It is the next afternoon.

On Walter's bed, in the neat little room off the "library," lies old Mr. Brand, quietly sleeping. The rattle of the carts on the avenue, the heavy grinding rumble of the horse-cars, the screams of the hucksters, the thousand hoarse noises of the city streets, mingle in a subdued roar that is tempered by distance and brick walls into a soothing sound.

When Walter entered this quiet room he found Hilda sitting in a low rocking-chair by the bedside.

"Has he become clearly conscious?" he asked her, for Mr. Brand had been somewhat delirious during the night.

"Yes," she answered, in a whisper; "he knew me, and asked where we were and what had happened, yet seemed to care very little for these things, only begging Elsie to come to him."

Walter started. Was *his* Elsie the lost daughter and sister, the darling of the old man's heart, for lack of whom his weak moral nature had broken down? Elsie was not an uncommon name. It might be only a coincidence.

"Hilda," he said, quietly, "what causes your father to think so strongly that your sister—Elsie did you say her name was?—is here in New York? Perhaps he had some clew which would help me to look for her. I am a famous detective."

"I never could find out. Father once said that the Irishwoman I told you of came here, but afterward he denied that he knew any thing about it. So I have always thought it was only a hallucination of his, but one I could never dissipate;" and she sighed wearily.

"Tell me what Elsie looked like," he asked, again, and was startled by the resemblance she drew of her to the picture of the little girl he had won from barbarism five years before. When she spoke of her sweet silvery voice as a marked characteristic, and dwelt with loving earnestness on the pretty way in which she sang, he was almost sure of the identity, and came near blurting out the whole story.

"If Elsie had only lived" (Hilda persisted in thinking her dead), "papa never would have been led away so, I am sure. It is his despair."

"Oh, keep up your courage! It's not too late to renew the search. I tell you again I am famous as a detective."

The surgeon dropped in before long, and announced Mr. Brand to be feverish and weak, but that his constitution seemed to be good, and all the physician's anxiety was concerning the patient's habit of moaning and muttering in his sleep, as though he had some settled grief or perplexity, which might induce congestion of the brain.

Walter thought it all over. He recalled every incident connected with Elsie's history, and recited to himself all that she had told him of her vague recollections. He questioned Hilda once more as to her sister, and the more he studied the resemblance in face, form, and manner, the more firmly he became convinced that his "little sister" was the lost darling of his guests. It was with mingled sensations that he admitted this, and with conflicting hopes that he resolved to put it to the test. If *his* Elsie was *their* Elsie, there could be no question as to his duty. But he had been indulging almost paternal anticipations of her future, and had been allowing his love for the little waif to grow beyond his record, until now the prospect of losing her had a bitterness in it akin to the sorrow a father's heart would feel in like circumstances. So his honest hope that he might be able to reunite this broken family was in conflict with his selfish yet irrepressible wish that she might prove, after all, not to be their Elsie, but only his.

Doing and thinking thus occupied several days, during which (after the first) Condon went about his work as usual. Mr. Brand's wounds healed, and he seemed to grow better, yet his mind remained dreadfully morbid, and he chafed because his illness prevented him from searching for his daughter. All knew what *his* searching would amount to; yet perhaps he did have an idea of her true fate, or he never would have mired body and soul in the slums of the Fourth Ward. At last the surgeon positively declared to Condon that unless the patient ceased fretting he would speedily die.

That same evening Walter called Hilda cheerily to come into the library, and when she had presented herself, with a puzzled air, he said, "You are looking well to-night, Miss Brand; I think you are bearing your burden heroically."

"I am surrounded by so much kindness," she answered, with the brightest smile he had seen for many a day, "that I should be very ungrateful to let my troubles annoy any one. I really *do* feel more courageous than I did. But why do you ask?"

"Because," he said, "I wanted you to be sure of your nerves before I told you something."

"Oh, is it bad news?—or—or—have you found out any thing about Elsie?"

"Yes," he answered, so composedly that she became calm also, "I have found a clew —some one who thinks she can tell you about your sister; and if this person is right, Elsie is alive and happy."

Hilda did not speak. She sat before him, her delicate hands clasped upon her lap, listening with rapt attention to his words, her face rippling with a new light, full of a tender beauty and sweetness.

"You have heard what Dr. Gaines fears. Time, then, is precious. Now to-morrow morning I shall want you to go up the Hudson a little way with me and see this person. We will be back in the afternoon, and can leave your father quite safely. You can decide better than I whether this young lady really knows Elsie, or whether it is some one else she has in mind."

"Of course I will go," she said, eagerly, "if you think I can be spared. But tell me, how did you find this person?"

"You shall know to-morrow."

The next morning was warm and balmy —one of those earliest spring days that sometimes follow the fiercest storms, suggesting to every heart into which the sap of nature can creep that the light and joy and fullness of summer approach. The city streets were alive to this gentle influence as well as the country lanes. Children crept out of tall dingy tenements and played in the sun; grandfathers marched out to the bit of garden behind the brown-stone houses and examined the swelling buds of the single grape that struggled for existence in the scant soil; middle-aged men in dark counting-rooms turned the pages of their huge ledgers with an indolent and weary air, while younger clerks examined fondly their fishing-rods before going down to business, and talked all the way of trout brooks and snipe-shooting.

This strength of hope, this vivifying influence of the growing sun, penetrated even to the sick-room of that quiet house in C—— Street, and the wounded man was quite as generously happy in the prospect of his daughter's having a holiday as she was glad of a little relief from her vigil. She was happy and buoyant, but Walter found it hard to disguise his seriousness.

Their destination reached, they drove at once to the school on the edge of the pretty town. Some one of the pupils was playing upon a piano and singing in the next room to the reception parlor as they sat down, and the sweet girlish voice at once attracted Hilda's attention in a marked manner. Condon was regarding her closely, for he had arranged with the principal of the school that Elsie should sing at that time as she was doing, but he did not guess to what arts the music teacher had been compelled to resort to carry out the plan. Now Walter was watching to see whether Hilda would recognize the voice. He had not long to wait. Hilda turned to him with an eager gesture and swimming eyes.

"Oh, Mr. Condon, if I thought it possible, I should say that was Elsie's own voice!"

Then a light seemed to break in upon her —a light that irradiated her countenance, and she cried out, "Who is it who is going to tell me about her? Is it—oh, is it she herself?"

There was no time for Walter to reply, for Elsie, little thinking who was awaiting her, and little caring, so delighted was she with the thought that her "brother" had come to visit her—Elsie, bright and winning, sparkling with the zest of study and keen enjoyment of existence—came running into the room.

She was thinking solely of Walter, but she saw some one else—a lady she could not find a place for in her recollection, yet whom she was intuitively certain belonged there, through whose face swiftly opened a vista into her forgotten childhood, where the landscape of memory was yet dim, truly, but now reached farther than a moment ago. All this was instantaneous, an impression rather than a ratiocination, for before she had half checked her impetuous entry she saw this lady leap up, saw her reach out her arms, heard her cry, "Elsie!"

Then she knew her, and only saying, "Hilda!" was folded in her embrace.

V.

Time swept on. Mr. Brand was won back to life through the inspiration of Elsie's return, as he had been sent astray by the culmination of his misfortunes in her disappearance. And not this only, but won back to sobriety. He seemed to remember only vaguely, as a disturbed chaotic dream, the life that he had led in the gutters of Washington and New York, shedding bitter tears over the ingratitude he had shown to his noble daughter, the disgrace he had brought upon the good old family name, the brutishness and evil he had done. He himself never sought excuse in the plea of insanity, but the more he learned of Mr. Brand, the more Walter became convinced that the unaccountable degradation of the old man—aged in tribulation rather than in years—proceeded from aberration of a brilliant mind unstayed by strong principles and impotent to endure sorrow.

His strength restored, Mr. Brand was glad to accept a position as proof-reader on one of the daily newspapers, obtained with Walter's help, while Hilda returned to her reporting. They installed themselves in a cozy little home near Condon's, and Elsie continued her studies. So when the spring had fully passed, and Elsie came home for her summer vacation, affairs were moving quietly and happily every where.

September came again, and a year to a day from the time when Hilda Brand came to our office to get some work to do, and Walter had first met and frightened her, those two went up with Elsie to her school, and left her beginning another year of study. They returned to New York by a steamboat in the evening, and sat long on the deck, watching the romantic shores sweeping by them. It was Hilda's first voyage on the noble river, and Walter interested her greatly by his graphic accounts of the villages and cultured homesteads that line the banks. But the deepening night and the passengers leaving the deck made her suddenly rise and say, "Shall we not go in?"

"Is it not too pleasant?" he replied. "Besides, I have not finished my cigar."

"Very well, then;" and quietly resuming her seat, she watched composedly the dancing path of the moon on the river—more composedly, perhaps, than if she had seen the intense, passionate look in the face of the man at her side, his cigar hanging idly from his fingers, his eyes on her countenance.

At last, with a half-trembling dread of the silence that had fallen between them, she turns, with downcast eyes, and says, "You have been very, very noble and true to me and mine. How can I ever pay you?"

She does not anticipate the answer that comes with startling quickness:

"I ask a great price—even the gift of yourself; and having trusted me before, will you not trust me now?"

The burning blushes and the sweet eyes raised timidly to his do not say him nay.

RAMBLES IN THE SOUTH OF FRANCE.

I.

PARIS, although one of the most historical of cities, is, however, in our age, a city of the present in the impression it leaves upon the mind. The past, with all its glories and horrors, does not obtrude itself upon the thoughts of the fascinated visitor; and as for the future, who ever thinks of it in Paris? But one scarcely needs to proceed beyond the outskirts of the city to realize at once the inexhaustible wealth of historical associations and antiquities of France, and the endless variety, picturesqueness, and attractiveness of her scenery.

Never did I realize the truth of these reflections more vividly than when I took the evening express train at Paris for the south of France. Hour after hour through the night we sped toward the sunny south, flying the mists and blasts of the north. The golden flush of dawn revealed a change of climate, scenery, and time. The Lugdunensis of the Romans carried the mind back twenty centuries, and the blue Rhone, shooting with arrowy current by vineyard and chalet, by abrupt cliffs and crumbling castles, all mellowed by the magical touch of southern sunshine, suggested another scenery and a more genial climate than those I had left only a few hours before. I did not stop at Lyons, having been there already, but there are few cities that can vie with it in nobleness of situation, lying as it does

LYONS.

partly on a hill at the junction of the Saône and the Rhone.

There is scarcely a town or hamlet after leaving Lyons that does not invite the traveller to stop and investigate its objects of antiquarian interest, mediæval towers, like the crumbling castle of Crousol, Romanesque and Gothic chapels, but more especially the remains of the former dominion of Rome. Vienne and Valence are especially opulent in such antiquities. But unless the traveller can include the whole of France in his plans, he will not tarry on his southward route until he arrives at Orange, formerly called Aurasio. Orange was the seat of the duchy of that name, and gave the title to the celebrated William of Orange and his successors, and it was not annexed to France until the seventeenth century. Orange is now a quiet little town on the Rhone, at the foot of a hill which is crested by a colossal statue of the Virgin. It has for ages modestly had in its possession some very interesting Roman antiquities, and made very little noise about them, for their existence seems to be generally ignored by all but a few antiquarians. The theatre is in a commanding position, the stage, proscenium, and lower tier of seats cut into the rock; the wall sustaining the upper rows soars nearly 100 feet, with a length of 320 feet. The upper tiers are nearly obliterated, but there was room originally for about 7000 spectators. The decorative work of the façade is of a stately simplicity, but the immensity of such an isolated wall is very impressive. The triumphal arch is still in nearly perfect preservation, and with the rich golden hue of its masonry offers one of the most effective antiquities of France. It is probably the

ARCH OF TRIUMPH AT ORANGE.

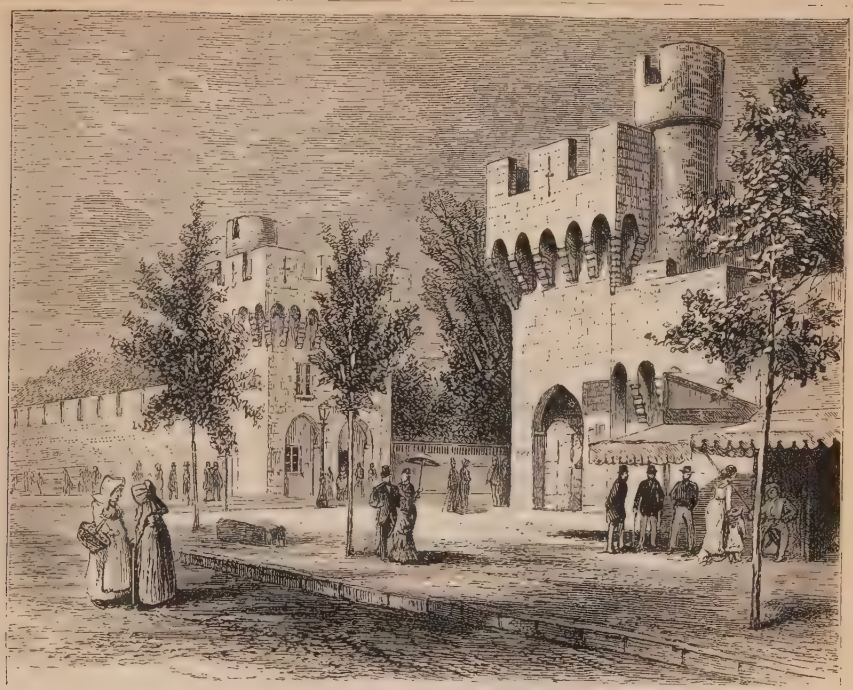
finest Roman triumphal arch now existing out of Italy. It is seventy feet in height by sixty-eight in breadth, and is composed of a central arch, whose cornice is supported by Corinthian columns, and a smaller arch on each side. The sculptures, representing battle scenes, are very rich in design, and in excellent preservation. The circus was an enormous structure, although less in size than those of Nimes and Arles, but it is now represented only by a few fragments, a bit of wall, a gate, and an archway.

MAP OF SOUTHERN FRANCE.

But the mellow musical carillon of the many bells of Avignon seems to float on the soft southern air on this dreamy summer morning, and to bid us no longer linger at Orange, but hasten to the queen city of Provence, seated royally by the Rhone, cinctured with her zone of turrets, chanting the story of Petrarch and Laura, and repeating the legends and pageants of other days, whose memory she holds an inalienable possession while the ages and the generations pass on to the shadowy land.

Avignon was probably founded by the Phocæans, who were also the settlers of Marseilles. It was a city of importance in the time of Cæsar, to whom it gave its support in his war against Pompey, and he proudly declared that he gloried in his city of Avenio, and prized it next to Rome. After various vicissitudes Avignon sided with the Albigenses, and in 1226 was stormed by Louis VIII. after a three months' siege, and many of the inhabitants were put to the sword. Reverting after this to the Counts

CASTLE OF CROUSOL, ON THE RHONE, NEAR VALENCE.



AVIGNON.

of Provence, the city, in the year 1348, was sold to Pope Clement VI., although the Holy See was transferred from the banks of the Tiber to the banks of the Rhone in 1308 under Clement V. It is stated on good authority that the purchase-money never was paid; the right of possession, however, seems amply to have sufficed to enable the papacy to retain a firm hold of the city, and maintain their authority over it for nearly five centuries; during that period twenty-one Church Councils were held within its walls. In 1791 the people of Avignon arose, fired by the influence of the French Revolution, and weary apparently of the easy government they had enjoyed, threw off the papal yoke, and became Frenchmen again in name as well as in blood.

The abode of the popes at Avignon forms the most brilliant episode in its history, and one of the most brilliant and romantic of the Middle Ages. Seven popes reigned there, during a period of seventy years. An old chronicler notes the significant repetition of the number seven at Avignon: seven popes, seventy years, seven metropolitan churches, seven colleges, seven city gates, seven hospitals. He also states that there was a clock in the Palace of the Popes which sounded automatically at the death and election of a pope. The clever jugglery which has been at the bottom of so many modern miracles was probably responsible for the singularly intelligent action of this wonderful clock.

In those jovial days Avignon numbered over a hundred thousand inhabitants. Why should they not be jovial? There is nothing in history to indicate that the popes were more solemn-faced than other men, and never were courts more festive than those of Avignon. Thither flocked the young, the powerful, the beautiful, and the gay of every rank. Even the churches were gay; there were three hundred steeples within its walls in those days, and from the vociferous throats of hundreds of bells rang jubilant peals of silvery jangling day and night, insomuch that Avignon was called the "ville sonnante." There are fewer bells in Avignon to-day, but their merry chime still floats long and often over river and valley. Religion and love here went hand in hand; while the city swarmed with monks and priests, voluptuous strains of music mingled with the sacred uproar of bells, troubadours held their courts of love, and celibate eyes looked with not unrequited ardor on the seductive attractions of the dames of Provence; courtesans by thousands contributed to the not always sanctified pleasures of Avignon in those memorable days; and, in a word, like most large capitals, Avignon was unconscionably gay, and sufficiently naughty to be very attractive. In those days the proverb became current, "Abandon Avignon, abandon common-sense."

Like the foreboding voice of Jonah, a terrible earthquake in 1348 awoke the festive throngs of Avignon out of their dreams of pleasure, and then the destroying angel waved his sword over the city. The black death, as it is called, which was doubtless the plague, carried off fourteen hundred victims in three days, and within a few months upward of eighty thousand died in Avignon; some historians place the number higher. Then it was that Laura de Sade, immortalized by Petrarch, while still in the flower

RUE PÉTRARQUE, AVIGNON.

of her beauty, passed to the land of shades. But the city soon recovered from the blow, although the population was never again as large as it had been.

And now what remains of all this pomp and revelry? Nothing; but the city still stands by the Rhone, possessing many witnesses of its former glory. The machicolated walls and towers, of a tawny yellow color, are still well preserved, and offer one of the best examples of the fortification of the Middle Ages now in existence. Time has dealt gently with them; the mildness of the climate has tended to polish rather than to destroy the masonry, and the slight damages of five centuries have been recently restored. The filling up of the fosse has, however, taken away something from the original grandeur of these walls. The promenade without the walls by the Rhone is very charming, and when one crosses the suspension-bridge toward evening, and gazes on the old town rising high above the river, he feels an inward sense of quiet, complete satisfaction.

There was another bridge once spanning the Rhone, constructed in 1171. It originally contained nineteen arches, and must have been a very picturesque structure. Repeatedly broken by hostile armies or the rushing torrent of the Rhone, only three venerable arches now remain. Numerous legends cluster around this bridge. It was designed by St. Benezet: so much is certain. He was a shepherd lad, who while pasturing his flocks received a Divine commission to construct a bridge over the Rhone, and with the permission of the Church he set about a task which was greatly demanded by the wants of the citizens, and had been hitherto prevented by great natural difficulties. I wish I could tell this story well; in the Church narrative it is a touching tale, rich in sacred details and profitable in moral instruction. But to repeat such a story well, one should thoroughly believe it. Doubtless Benezet was a good boy, and if he did all that is alleged of him, it may be readily granted that he was a miracle of precocious genius and piety, and richly deserved to be sainted. As it is, I am constrained to fall back on the bare facts that a great public work was needed, and the man to accomplish it appeared, as often occurs in the world's history. Most of the marvellous stories of mythology and hagiology have originated in this way.

On passing the Gate of Petrarch and entering within the walls of Avignon, the ravages of time are evident in the destruction of many quaint and interesting edifices, and the obliteration of numerous historic lanes and streets. Modern houses have elbowed their way into what was once a dense mass of buildings closely packed and huddled, with little order but wonderful picturesqueness, and airy squares have let in the sky and breezes of sunny Provence. Cheerful groups

chat before the cafés under cool awnings, and dames as fair as those of other days grace the promenades, and tend to lessen one's regret for by-gone times. But some dark narrow streets remain, however, and antiquities enough to suggest vividly the days when the tinkle of the troubadour's guitar and the tramp of gayly caparisoned steeds

NICOLAS GABRINI DE RIENZI.

and the ring of mail-clad knights sounded in this romantic town, summoning the fair Provençal dames to their casements.

The Palace of the Popes, an enormous, austere, castellated structure, somewhat in the form of a hollow square, whose tremendous walls rise like precipices, is the most interesting antiquity of Avignon, by its size and position dominating the whole city, and dwarfing every other structure by comparison. Originally built by Pope John XXII., it was subsequently enlarged by his successors, and the ceilings were elaborately frescoed and gilded, while hanging gardens on the roof of the stupendous pile somewhat relieved the severity of its external aspect.

Before time had impaired its pristine glory it was enthusiastically pronounced by Froissart to be the strongest and the most beautiful building in the world. Many banquets and pomps have occurred in its lordly halls, when its groined arches rang with the cling-clang of golden goblets and the minstrel's song; many dark tragedies have also been enacted there; in its oubliettes how many poor wretches have been tortured and smothered out of existence! from its machicolations hot lead and boiling pitch have been poured on besieging hosts with most destructive fervor; and with bated breath one learns of horrors almost incredible for their wickedness that have been enacted there. By a long and narrow winding passage one reaches the dungeon two stories underground, if we may use the term, in whose floor is a square aperture through which one looks into the gloom of the still deeper dungeon hewn out of the rock, in which Rienzi was immured. He was let down by a cord, there being no other entrance to this infernal prison-house, this living tomb of one of the greatest men of the Middle Ages.

Many of the passages are pierced within the thickness of the walls, such is their massiveness, and formerly there were several subterranean avenues of escape, including one that led under the Rhone itself. The popes evidently led an uneasy life amidst all their pomp and power. God does not intend that the Christian shall go through this life without bearing the cross.

But the loftiest towers have been shorn of some of their height, most of the frescoes have been whitewashed into oblivion, and the noble dimensions of the reception hall, the armory, the banqueting hall, and other spacious apartments have been reduced by partitions put up without regard or veneration for antiquity. It is little consolation to know that this was done in order to turn this venerable palace into barracks—a piece of vandalism altogether too common in this age. The halls and courts now swarm with soldiers.

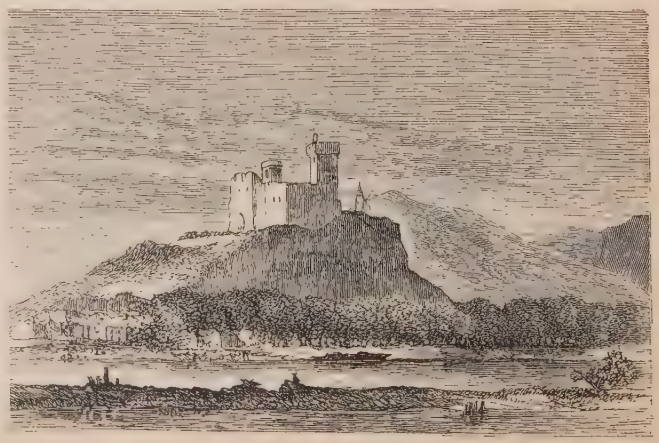
Adjoining the Palace of the Popes is the cathedral. It is not an edifice of unusual architectural beauty, and the changes and restorations have not added to its merits. But its venerable age, its commanding position, its associations, and a certain noble stateliness in its mien render it a very interesting church. One can not forget that Petrarch and Laura once trod its marble floor. Here also Charles VI. witnessed officially the crowning of Louis of Anjou. The

chronicler of the period recounts this event in the quaint French of the time: "In the year one thousand three hundred and eighty, the twenty-fifth day of October, came Monsieur Charles King of France to Avignon to crown the King Loïs of Jerusalem and Sicily. Item, the Pope Clement VII. chanted the mass, and after mass he crowned him in the Church of Our Lady of Doms. Item, the King of France repeated the creed, and the King of Armenia, Monsieur Philip, brother of the King of France, and the Duke of Orleans, and many other great lords and grand masters and barons, were presented to him." In a later age that noble sinner Marie de Medicis stopped at Avignon, and the dean of the cathedral addressed these extraordinary words to her: "Madame, if it is true that Nature once permitted the very rocks to be susceptible of emotion, this church, happily founded on the stability of a rock by Saint Martha, recognizing the beneficence of your royal presence, would prostrate itself at the feet of your most Christian Majesty." In our day this sounds like sarcasm; one can almost imagine the speaker looking over his shoulder and throwing a Mephistophelean wink to one of his attendants. The tomb of John XXII., which was formerly in one of the chapels of the nave, but for some absurd reason removed afterward to the sacristy, is a highly elaborate construction; the canopy is in best Gothic style, abounding in sumptuous ornamentation, and yet extremely graceful and elegant.

KING RENÉ'S CHÂTEAU, TARASCON.

After dreaming in the dusky storied aisles of the cathedral, one does not feel like descending at once to the city and the nineteenth century, but prefers to keep on to the Rocher des Doms—a lofty acclivity which falls precipitously to the Rhone, while the city clusters around its foot. The summit has been reclaimed from nature, and transformed into a beautiful public garden, with seats, statuary, a fountain, and well-arranged shrubbery. There is no spot I have seen in the south of France where I have more enjoyed my coffee and cigarette, listening to the bells of Avignon, and gazing on the towers of the old city and the glorious landscape which surrounds it. One of the most conspicuous objects in this enchanting prospect is Mont Ventaux—a cone rising alone above the vine-clad plains in the northern horizon to the height of 6000 feet. Its isolated position makes it seem much higher, while the ethereal roseate tint that invests it, and its regular but elusive form, make it seem less like a real mountain than like the shadow of an enormous pyramid projected against the sky.

ARCADES AT TARASCON.



Before leaving Avignon one naturally inquires about the tomb of Laura. It was in the Church of Santa Clara that Petrarch first saw her and was smitten with the fatal passion; but she was buried in the Church

VILLA NEUVE DES AVIGNON.

of the Cordeliers. Her effigy seems to have been graven on the tombstone. In 1533 Francis I., passing through Avignon, caused the tomb to be opened. In the coffin was found a sonnet and a quatrain by Petrarch. The king traced some verses composed by Marot on a parchment, and inclosing them with those of Petrarch, caused the tomb to be closed once more. But the ruffians of the French Revolution obliterated every trace of the burial-place of Laura de Sade, and scattered her remains to the winds. The verses of Petrarch have outlasted the mortality which they immortalized.

There is still at Avignon a street called Rue de la Tarasque. Thus is perpetuated one of the wildest legends of the south of France. That was the name applied to a horrible monster that devastated that region, devouring all who came within his grasp, and driving the rest of the population to the verge of insanity by the terror of his ravages. His back was armed like that of a tortoise, and a lion-like mane fringed his head; he belched forth flames from jaws ridged with spikes like the mouth of a crocodile. His tail, threshing like a flail, would completely demolish every thing within reach of its tremendous blows. In a word, this seems to have been a truly formidable demon, and there was therefore nothing unreasonable in the terror he inspired. He finally fell a victim to the seductive power of female influence; he was reduced to subjection by a lady, and under the spell of her charms followed her about like a lamb. This is not the only instance on record when monsters of rigor and cruelty have been tamed in this way. The origin of the legend is of very slight consequence, but the moral has a universal application. The Church, however, has appropriated the story, and canonized this typical representative of her sex under the name of Santa Martha.

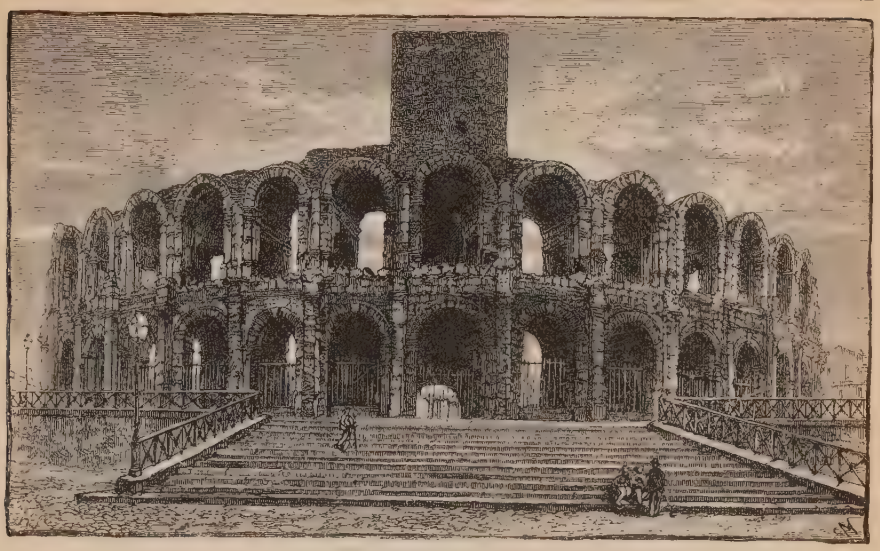
CASTLE OF BEAUCAIRE.

CLOÎTRE ST. TROPHISME, ARLES.

The railway train soon carried me from the Rue de la Tarasque, at Avignon, to the town of Tarascon, which also, by its name, perpetuates the legend, and indicates how strong was the impression it left in Provence. It is a quaint little city on the Rhone, with a variety of monumental antiquities, although none are sufficiently striking to detain one long in the place, with the exception of the castle, standing on a slight elevation near the river. It was built by King René, and is a large quadrangular pile, buttressed by round towers, and is still tolerably preserved. It is now occupied as a prison, but the superb carven ceilings of its once festive halls are in excellent condition. The covered market-places, or halles, remind one of the covered ways of Chester. Opposite to Tarascon is Beaucaire, which at one time was famous for its great international fairs, established by Count Raymond of Toulouse in 1217, to which merchants from all parts of Europe flocked every year in July. But the changing system of modern commerce gradually reduced the gatherings at these fairs, and the war of 1870 left them a merely local importance. The castle of Beaucaire is a very picturesque object.

To go from Tarascon to Arles is not only to get nearer to modern Rome in space, but also nearer to the Rome of antiquity—to the race whose mailed legions tramped as conquerors from Calpe to the Euphrates. At Arles we see their places of sport and holiday pleasures and their graves; the very people are of almost unmixed Roman type. The beauty of the women is perhaps softer than that of the Italian women; the expression has perhaps less fire, but more sensibility and refinement; the complexion is a shade lighter. But the dark piercing eye, the clusters of massy black tresses, the proud and erect figure, are the same in each. Even the old women are handsome at Arles. One might fancy that Ninon de l'Enclos was born there, so long did she retain the charms which fade so early with most of her sex. It is said that the beauty of the Arlesiennes, once so famed, is on the wane; if this be true, what must it have been when in its prime, if it is still so fascinating?

The distinctive costumes of Arles have been almost thrown aside by the importation of Parisian fashions. The workingman wears the ordinary blue blouse almost universal in French cities, while the feminine garb shows little that is peculiar except in the head-dress. Two styles seem most in vogue. This uniformity of costume now exists all over the south of France, except at some distance from the railways and among the Pyrenean districts.



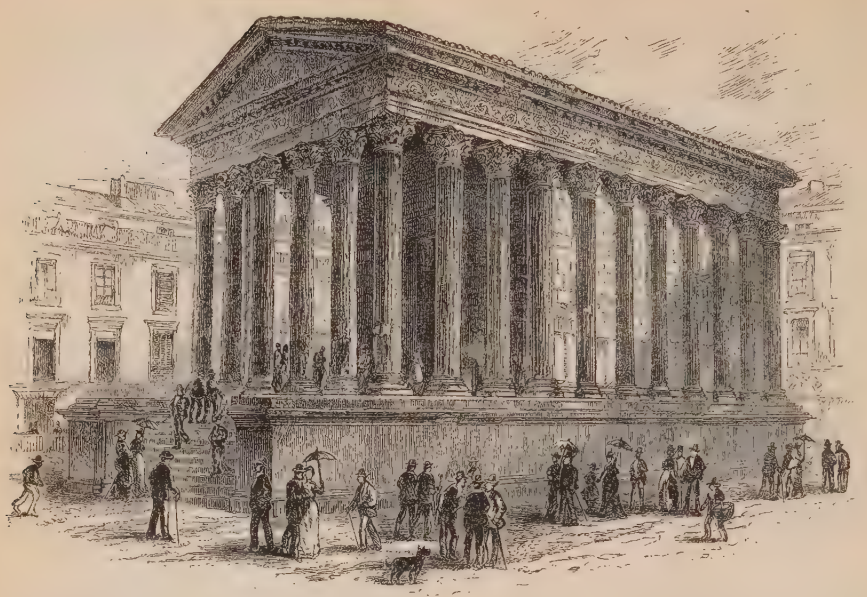
WOMEN OF ARLES.

Arles lies on a hill-side near the head of the delta of the Rhone. The streets are excessively narrow, winding, and steep; there is little vegetation about it, and it is not opulent in attractions as a place of residence; but it offers a very picturesque appearance from the opposite bank of the Rhone, and its antiquities scarcely yield in importance to those of any other city in Provence. At every turn one discovers an antique fragment by the road-side, or incorporated into the walls of a dwelling; here a bit of a column, there a slab from a sarcophagus, or a Roman or mediæval carving recalling its former splendor. Near the banks of the Rhone are the remains of the magnificent palace of Constantine, forming portions of modern buildings; there still remains a line of crumbling ramparts with a ruined gateway, and traces of a Roman bridge and aqueduct are yet apparent. In the Place Royale stands a monolith nearly fifty feet high, the only obelisk of such size ever executed in Europe, it is said, although I am inclined to doubt the statement. In the ancient forum are two granite columns and remains of the façade of the public baths. Here was doubtless the busiest and most attractive spot at Arles in olden time, especially if it was shaded then as now by magnificent plane-trees bestowing their benison of grateful shade in summer, while the cicada buzzed its droning tune in their branches at noontime, and the swallows twittered an almost deafening yet not unmelodious chatter at dawn and sunset. I was awaked by these birds when I was staying at the Hôtel du Nord, and carried back to boyhood days in the East by a sound familiar to one who has ever lived near the plane and cypress groves of Smyrna. Under this hotel are portions of the ancient catacombs of Arles, which ramify largely under the city. The garçon of the hotel led me down to a considerable depth into vaults and winding passages where the light of day has never penetrated, and saturated with dampness that chills one to the marrow. Although the dead who were once laid there have been disturbed in their slumbers, and their skeletons removed from the shelves whereon they once reposed, yet the bones still remain thrown together in ghastly heaps. Some people would shrink from sleeping directly over a grave-yard. I confess that an awesome feeling just shivered through me as I stepped into bed, but I slept undisturbed by ghosts or ghouls until the matins of the birds and the rays of

PLACE ROYALE, CHURCH OF ST. TROPHISMUS, AND OBELISK, AT ARLES.

COLISEUM AT ARLES.

the rising sun floated in through the casement.



The people of Arles seemed so little disturbed by such near proximity with the dead that the chief promenade of the city is the Aliscamps, a vast historic cemetery, which of late years has been adorned with avenues of poplars. There the Romans of old were buried for ages. When Arles came under the sway of Christianity the Aliscamps was consecrated, and after that, according to popular belief, the inhabitants of that vast necropolis had no further power to wander at midnight or disturb the rest of the faithful. Nay, more, the Archbishop Michael de Morières, in a circular epistle addressed to Christendom in 1203, affirmed that Christ himself had come down and bestowed His benison on the cemetery, and that ever afterward, on serene nights, angels sang mystic strains over the dead of the Aliscamps. The fame of this spread abroad, and for long the dead along the Rhone were floated down the river to be buried in this sacred city of oblivion.

The theatre of Arles, a Roman antiquity, constructed of marble, is now in a very dilapidated condition, but much that is very interesting and instructive still remains to recall before us an audience of 16,000, clad in blue, white, scarlet, and orange-hued togas, under an awning woven with many tints, while the actors, masked and buskined, played a comedy of Plautus. Fronting the semicircle of marble seats two Corinthian columns still mount guard like sentinels over this scene of former festivity and splendor. The Venus of Arles, which is now in the Louvre, and is one of the master-pieces of antiquity, was discovered in this theatre.

A few rods from this spot is the magnificent amphitheatre, the largest in existence outside of Italy. It has a diameter of nearly 450 feet, and it is estimated that it could seat 30,000 spectators. During the Dark Ages it was in possession of the Saracens when they ruled in Provence, and turning it into a fortress, they added four massive towers, of which three remain. During the Middle Ages the demolition of the vast edi-

ROMAN THEATRE AT ARLES.

LA MAISON CARREE, NÎMES.

fice was continued, and the massive blocks of which the upper tiers were constructed were broken for dwellings, which now arose within its circumference; no less than 212 houses and a church were crowded together in the amphitheatre. In 1825 the interior was cleared of these obstructions, and more recently the venerable edifice has been sufficiently restored to prevent its further decay. Nothing could be more massive than the construction of this stupendous building; standing on the brow of a hill, its foundations and part of the lower two corridors, which run entirely around the edifice, are actually hewn out of the solid rock, and are firm as the everlasting hills. The dens of the wild beasts are dark as night, and one does not feel cheerful as he thinks of the lions and the bulls which rushed forth from those abodes of gloom, infuriated by confinement and hunger, and instantly crunching the bones of gladiator and martyr, or tossing them toward the pitiless sky in the sight of multitudes applauding and yelling with blood-thirsty excitement.

On the whole, it is a relief to turn to the quiet seclusion of the beautiful cloisters of St. Trophismus. The church was founded in 603, but has been at different epochs so altered and restored as to leave little of the original plan. But the deep canopy over the entrance is a construction of the eleventh or twelfth century, and is very interesting. In the different groups of sculptured figures, which are still in excellent preservation, an entire sacred drama seems to be represented, alternately grotesque, horrible, or pathetic. The cloisters adjoining the church are among the most beautiful in the south of Europe. They are of gray marble, still in good condition, and display an extraordinary fertility of imagination in the variety and elegance of the designs executed upon the pillars and capitals. It is curious that two sides of the quadrangle are in Romanesque style, while the other two are pure Gothic. As the whole seems to have been wrought at the same period it is difficult to account for this diversity, except as a simple mode adopted for comparing the waning and rising schools of architecture; or two architects of equal abilities may have been employed in designing the plan, and thus engaged in a friendly artistic rivalry, each exerting his happiest efforts in behalf of his favorite style.

Passing out of Arles between two of the towers of the old Roman walls, I now turned my face westward. The famed mistral, or northwest wind, was blowing fiercely that day, filling the summer air with a piercing wintry chill; clouds of fine dust dimmed the landscape with a coppery haze, rolling over the Rhone like smoke from a furnace. The river was lashed to foam. The mistral, sweeping down from the Cevennes over the plains of Provence and Languedoc, is to that region as great a scourge as the simoom to the lands bordering on the great desert. "The mistral, the Parliament, and the Durance are the three great scourges of Provence," was an old saying. The last two have ceased their terrors, but the mistral still blows. The Romans built temples to

FOUNTAIN OF NÎMES.

propitiate the deity of the mistral. A kindly old priest who sat opposite to me said, "This is nothing; I've seen it blow much harder. I remember when I was a boy at school it blew in the windows on one side of the house: there was a wind!"

There was a simple pathos in this reference to his earlier days. His life, now nearly spent, blighted by the miasma of enforced celibacy, sunless, cheerless, hopeless, offered little that could be satisfactory in the retrospect. But he still clung to the memory of his youth, when hope beckoned him to a dream-land which he had never reached. A pleasant conversation followed, and with genuine courtesy he held out his snuff-box to me. He seemed by this simple act to say, "Our lives, our aims, our beliefs, are far apart, but are we not all brothers, with one father, God?"

I crossed the head of the vast alluvial plain called the Camargue, deposited during long ages by the delta of the Rhone. Its fen-lands are pastured by droves of half-wild cattle, but skillful engineering is gradually reclaiming it for agriculture. Partial-

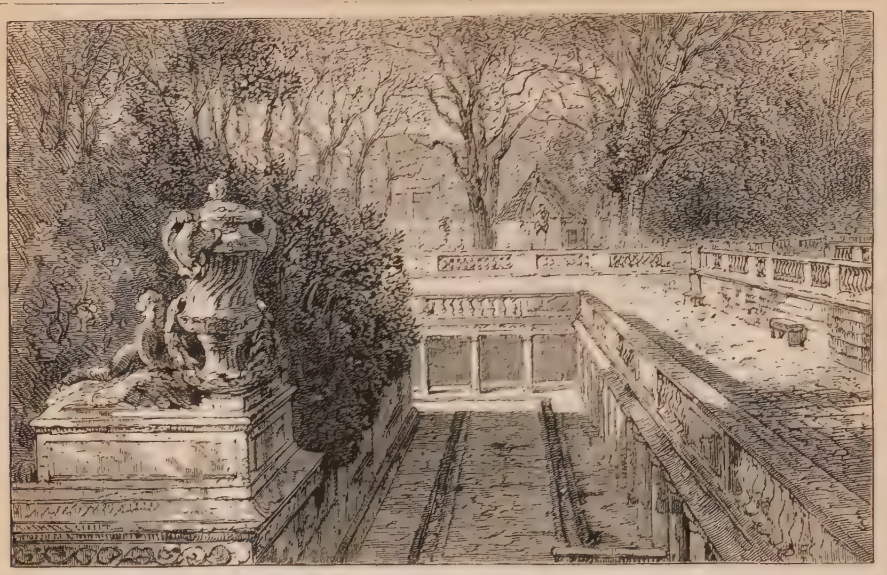
AMPHITHEATRE AT NÎMES.

ly retracing my steps, at Lunel, I at last arrived at Nîmes—an old Roman city, and now one of the most cheerful and flourishing places in the south of France, with a growing population of sixty thousand. Antiquity and modern times are here strangely contrasted. The city of the Middle Ages forms the kernel around which circle the broad verdurous boulevards of the modern city. The streets of the old town form a most intricate labyrinth, filled with booths and market stalls, and closed in with grim old-time dwellings. In the centre stands the cathedral. Here in former ages the Huguenots had one of their greatest strongholds; and in spite of the awful persecutions that followed the revocation of the Edict of Nantes, and the bloody riots that assailed them as late as 1793 and 1848, they still form a fourth of the population, and pay half of the city taxes, which speaks well for their social position. Claude Brousson, one of the most noted martyrs of the persecutions of that eminent saint in the Lord, Louis XIV., was a native of Nîmes, and an influential lawyer of that city, until he was forced to fly to Geneva, where he took orders, and, at hourly risk of his life, preached the Gospel among the mountains of Dauphiny. Twice returning to Nîmes, he was once saved by hiding in a well; but the Guion old man who concealed him was broken on the wheel. Brousson was finally betrayed at Oberon, and broken on the wheel at Montpellier. It is not much over a century and a half since such things were done in the foremost country of Europe, and there are still some who approve of those deeds. A quarry in the environs of Nîmes was in those days the place where the Huguenots met secretly.

Among the modern objects of interest at Nîmes is the beautiful esplanade, where crowds assemble on summer evenings, and make one almost fancy he is again in Paris. It is graced by a superb fountain, the *chef-d'œuvre* of Pradier. The colossal central statue represents Nîmes, supported by symbolical statues of the genii of the four neighboring rivers—the Rhone, the Gardon, the Eures, and the river of Nîmes. But the great interest of this fascinating city is in its Roman antiquities, which, outside of Italy, are rivalled only by those of Arles, while they appear to more advantage than those of that city, because better situated. The Maison Carrée is a temple conjectured by some to be the annex of a forum. It is in excellent preservation, after the Corinthian order, and very pure in its style; indeed, few buildings more elegant than this are in existence. It has in turn been used as a coach-house, a stable, a church, and a storehouse, and is now a museum. It is an oblong square, seventy-five feet long and thirty-seven feet wide. On the floor of the interior are preserved three very beautiful mosaic designs, found in Roman villas at Nîmes which are now demolished. Of the

paintings and sculptures there is not much to be said, with a few exceptions. Paul Delaroche is represented by one of his masterpieces — the well-known painting of Cromwell opening the coffin of Charles I. There is also a powerful work by Sigallon.

The Jardin de la Fontaine is, on the whole, the most attractive spot in Nîmes. A spring bursts forth on the edge of the city, which feeds a river that courses through the principal streets between massive quays and under elegant bridges. The ancient Romans and the French have both availed themselves of the opportunities afforded by this stream to utilize it for sanitary and æsthetic purposes. The former established thermæ near its source; of these a nymphæum (now misnamed the Fountain of Diana) remains—a very graceful structure in rather dilapidated condition; there is also traceable the plan of an atrium and colonnaded baths. The latter were restored in the last century, and now worthily form the central object of one of the most beautiful promenades in France, sumptuously adorned with statuary and foliage, including a fine statue of Jean Reboul, the Provençal bard.



NÎMES.

FOUNTAIN OF DIANA, NÎMES.

Behind this spot rises a lofty hill, shaded by pine and chestnut groves, where the drone of the cicada imparts an indescribable dreaminess to the aspect of things. At the summit of this hill is the Tour Magne, an octagonal structure, somewhat resembling a tower, over sixty feet high.

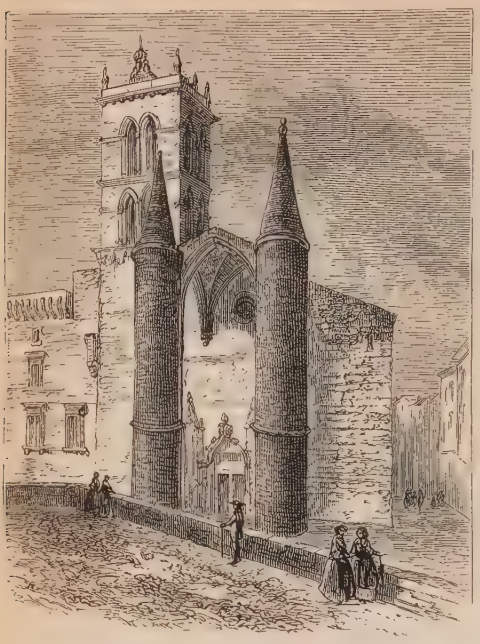
Two of the gates of the old city still exist at Nîmes, offering some fine marble sculptures; but when one has been here and there about the old city, and seen all its antiquities, he returns again and again with growing interest to a contemplation of its magnificent amphitheatre. It is slightly elliptical in form, and smaller than the amphitheatre of Arles, and perhaps inferior to that in purity of style; but its situation makes it, on the whole, more attractive and cheerful, and it could once seat twenty-five thousand spectators, which is quite an army. Each division of seats—one for the patricians, another for the equitarii, or knights, and two upper tiers for the plebeians—had its own vomitorium, or exit, with distinct corridors, and these are all yet in good preservation. So enormous is the strength and so massive is the construction of this edifice that when Charles Martel expelled the Saracens from it, and filled the corridors with wood and tried to burn it down, he was unable to make any perceptible impression. The arena is still used for bull-fights on fête days. I witnessed a spectacle of this sort in that place which in a remote way served to give me an idea of the grandeur of a gladiatorial day, or a fight with wild beasts, in those by-gone times when those vast tiers of marble were thronged with myriads robed in purple and gold. There were about six thousand present on this occasion. More probably would have attended if it had been a regular bull-fight instead of a cow-fight which was offered on the bills. But

ROMAN BATHS, NÎMES.

if less exciting, there was nearly as much fun in the spectacle I saw there. It was advertised as a "course libre," which meant that all who chose could enter the arena and join in the sport. The cows, if not as dangerous as bulls, were of Spanish breed, and by no means to be despised; if their horns had not been bound in felt, more than one champion would have lost his life in the arena that afternoon. Between the horns a rosette was firmly bound, and the lucky fellow who could tear it off won a gold piece and lots of applause. Many a daring youth licked the dust that day. Several had their shirts torn off, and received very severe blows in the back, which doubtless earned for them plenty of cheap and wholesome advice when they got home. One was pinned against the wall between the cow's horns, and had a very narrow escape. Sometimes there were nearly a hundred men in the arena at once, and this was one reason why none were killed outright, for as soon as one sportsman was knocked over, all the others rushed in and diverted the attention of the poor infuriated brute, which would finally get completely worried out and baffled from the constant rush of one and another. Thus the large number of men in the arena served as a protection rather than an increase of the danger. The prize was won three times in succession by one man—young, lithe, handsome, and apparently made of steel and India rubber. He had a genius for that sort of thing evidently; but I could not help thinking how like that was to the game of life—how many try, how few win!

The view in the galleries was scarcely less animated. On the shady side of the arena the throng was gathered from every class, from English noblemen to the lowest canaille who could muster a few sous to pay for a back seat. Brilliant costumes and elegant toilets were not wanting to remind one of the scarlet togas and magnificent women of olden times. The voluptuous and almost imperial beauty of some of the fair dames of Nîmes collected there in that hour was never surpassed in the brightest days of ancient Rome; and indeed it was Roman blood that gave to them a fiery and almost fierce splendor, such as may be rivalled but can not be transcended out of the south of France. There were also present some fine specimens of masculine beauty. The people of Languedoc and Provence, if less intellectual-looking than those of other parts of France, certainly present one of the noblest types of physical beauty the world has seen. Throughout this multitude the most vivid interest in the game became more and more evident, stimulated somewhat, perhaps, by the absinthe, eau-de-vie, and coffee which were industriously circulated by lithe, bare-headed Ganymedes, who attracted my attention by the way in which, waiter and glasses in hand, they walked and balanced themselves on the bevelled edge of the wall in front of the lower tier.

But the interest and excitement culminated during the recess between the acts, if one may so express it. The gate was unbarred, and a mob of boys and youths rushed in to participate in a scene which was evidently a customary part of the programme. For a few moments they scattered about the arena in search of coins which might have been missed by those to whom they



had been thrown. Suddenly one of the spectators hurled a circular cake into the air, and it fell spinning into the arena. This was the signal for one of the most extraordinary repetitions of the Kilkenny cats' fight that ever was seen. Men and boys rushed together in a perfect bedlam of confusion, each trying to seize the cake. It was torn into a hundred fragments in a moment; and now there rained a hail-storm of copper and silver coins, bonbons, cakes, loaves of bread, and fruit, thrown by the spectators, who were aroused to the last pitch of excitement and mirth as the multitude of men and boys scrambled together in an inextricably tangled mass of electrified humanity, every atom yelling, howling, struggling, pulling, tearing, kicking, leaping, pounding, and lurching with the energy of fighting demons, faces flushed, noses scratched and bloody, hair pulled, and clothes torn, and yet through it all entire good humor. Never in the roughest foot-ball match that I have witnessed did I see any thing to approach the raciness and roughness of this remarkable and blood-stirring spectacle in the arena at Nîmes.

Then the trumpet blew a long blast, and all the younger combatants were turned out again, and the cattle were let in for the second act. After this was over, a noble Spanish bull, black as night, was led around the arena. He was the prize that was now to be drawn by lottery; each ticket of entrance had a number in the raffle, and a pretty little girl was selected to draw the lot. And thus ended a very entertaining afternoon's sport.

About two hours' ride from Nîmes is the famous Roman aqueduct called the Pont du Gard, probably the finest structure of the sort in existence, and one of the most majestic monuments bequeathed to our age by antiquity. It strides across the river Gardon, which rushes with a wild music over a rocky bed between hills savage and lonely. The aqueduct is broken at each end, but what remains of it is 800 feet long at the top, and nearly 150 feet above the river. It is composed of three tiers of arches, whose form is sufficiently explained by the accompanying cut. The blocks of which it is constructed are of enormous size, left somewhat in the rough, in a semi-rustic or ashlar style, and laid without cement, but fitting with the utmost nicety. The channel for the passage of the water is covered with cement that is overlaid with stucco as hard and polished as marble. The corbels for the staging, by a singular long-sightedness, were left by the builders, as if to facilitate the repairs that might become necessary in the course of ages. A century ago a bridge was attached to the eastern side of the structure, which is not an improvement. The general effect of this stupendous pile, standing there alone, and colored a warm orange-yellow by time, is very impressive.

LE PONT DU GARD, NÎMES.

CATHEDRAL OF MONTPELLIER.

From Nîmes it is not far to Montpellier—a city celebrated for its medical university, but quite tame after one has sworn allegiance to the antiquities and cheerful streets and attractive people of Nîmes. The university is still entitled to a high rank, but by no means holds the same relative importance now that it did in the days when Rabelais was one of its shining lights. There is no doubt that the Moors, who once held the place, were the founders of this medical school. Notwithstanding its somewhat eventful history, Montpellier offers no monuments of much artistic or historic interest, excepting the porch of the cathedral. Its groined roof rests on one side against the wall of the façade, and is supported on the other by two enormous pointed towers or hollow pillars, which are more striking than beautiful. The architectural effect is unique.

The Peyrou is a terraced promenade of which the citizens are justly proud. It is laid out with much taste and elegance, and commands an extensive and beautiful prospect. Its origin is due to Louis XIV., whose statue adorns it. But one can not wholly enjoy the enchanting attractions of that lovely spot if he stops to reflect that for ages the Peyrou was the most noted place of execution in the south of France, and that there Claude Brousson and hundreds of other noble souls suffered martyrdom with the most excruciating torments the imagination could devise, for the sole reason that they claimed the God-given right to think for themselves.

The absence of Roman antiquities at Montpellier shows that one there passes into another class of associations—the mediæval—and also prepares one for the extraordinary contrast between Nîmes and Cette. On the way, as one crosses the salt-marshes and lagoons along the Mediterranean, lies Frontignan, with its choice little church, whose picturesque castellated tower well deserves the attention of the artist and the antiquary. The lagoons and canals, lighted here and there by a gleaming lateen-sail, and fringed by pyramids of glistening salt, are in striking contrast to the mountainous regions palely visible along the southern coast.

CHURCH AT FRONTIGNAN.

CLOISONNÉ ENAMEL.

THE legends which the Japanese have woven round the origin of art in Niphon, the "Land of the Rising Sun," are, if fanciful, both attractive and suggestive. According to one of these traditions, art was born about the beginning of the Christian era, when Nomino-Soukune abolished the cruel rite of burying living persons with the noble dead, and substituted clay images for human victims. According to a second tradition, art reached Japan about B.C. 200, through a band of emigrants from China. They had left their native land under the pretense of seeking and taking back to the Celestial Empire a vegetable specific against death, and having landed in Niphon, settled there permanently, and became teachers of science, art, and literature.

MODERN JAPANESE BOWL—CLOISONNÉ ON PORCELAIN.

These legends are recalled by a small specimen of the artistic work of the modern Japanese, an example of the developed skill of which the foundations were laid in times so remote and under circumstances so peculiar. It is a round covered bowl of porcelain, curiously decorated with enamels in bright colors by the method now known as *cloisonné*.

In a ground of azure-blue appear fine threads of brass, describing circles, diamonds, and other geometrical designs, and outlining the leaves, calyxes, and petals of flowers, and the fruit and tendrils of the vine. The fine brass ribbon or flattened wire forms a series of partitions which follow the details of the design. Within these bright and tiny borders are enamels of the colors approaching most nearly the tint of the leaf or flower imitated. Different shades of blue are thus mingled with brown, purple shading off into pale bluish-gray, white, pink, green, black, or pale yellow, and these again are heightened by contrast with arbitrary ground colors. The questions then naturally occur, what is enamel? how is brass wire fastened to porcelain? how are the cells filled with the enamel?—what, in short, is the *modus operandi* of the artist whose work we have been examining?

From first to last, the processes by which this bowl was artistically clothed with color are ingenious. In the first place, the porcelain is ground, for the purpose of removing the glaze from the exterior surface. This is necessary in order that the enamel may adhere firmly. In the next place, the artist, having sketched his design on paper, covers the drawing with a plate of glass, on the surface of which he bends a fine narrow brass ribbon or flat wire in such a way as to follow the outlines of the sketch. Every leaf is thus outlined, and becomes a cell —*cloison*—whence is derived the distinctive name *cloisonné*. Many of the cells entering into the geometrical part of the design are of the same shape, and are made upon one pattern. The same thing may be said of all the uniform cells which are scattered over Japanese *cloisonné*. They are not always used strictly as cells for the reception of a certain color, but very frequently are merely imbedded in the ground for the

COVER OF JAPANESE BOWL.

OLD CHINESE CLOISONNÉ ON METAL.

purpose of lighting it up and giving it the variety effected by threads of burnished gold. The edge of the wire is then applied to the surface of the bowl, and fixed by means of a fusible glass.

Enamel is simply powdered glass. The word is found in many languages, *émail* in French, *haschmal* in Hebrew, and is the equivalent of the German *schmelzen*, the Latin *smaltum*, and the Italian *smalto*. Its etymology and synonyms are chiefly interesting at present as indicating an almost universal use. Pure enamel is a colorless compound of silex and oxide of lead, or of silica, litharge, and nitre, with white lead or silex powder added to give the mass fusibility. These ingredients are fused together. The colors are derived from a variety of oxides. That of tin makes an opaque white enamel, and the addition of manganese gives the white clearness and brilliancy. The chief colors are thus produced: blue from the oxide of cobalt, green from the oxide of copper, violet from black calx of manganese, yellow from silver, purple from gold, and red from the sulphates of iron and alumina. Practically the artist's palette is unlimited.

We will now suppose that the brass wire is fastened to the porcelain, and that the enamels are in the form of a paste ready for use. The next step is to fill the cells with the enamel. In doing so, the artist uses pastes of the colors indicated in his design. The piece is then baked, and the enamels, having melted, settle down in the cells, which are filled as often as required to bring the coat of enamel to the proper thickness, the firing being renewed between each addition of the enamel paste. After the final firing the surface is rough, and is treated like that of plate-glass. It is first ground with coarse stone, then with finer stones, and finally with charcoal. The melting of the enamel has, of course, had the effect of fixing the brass wire more firmly to the porcelain than could be effected by the first application of glass solder. The piece is now ready for the market, its surface glossy and smooth, and the fine lines of wire every where distinctly traceable.

Cloisonné enamel was not invented in Japan, and that country may be left in the mean time in order that its history, so far as known, may be traced elsewhere. The origin of the art of enamelling has not been ascertained, but all the evidence points toward Asia —Assyria, Chaldea, Persia, and India— that mysterious East whose contributions to the science and art of the world can never be fully computed.

If this be so, the process spread from these central regions toward China on the one hand and Egypt on the other at a very early date. The little now known about Central Asia has reference chiefly to Persia and India, and comes within the domain of comparatively modern history. The Indian process is that known as *champlevé*, by which the design is hollowed out of a plate of metal prepared for the reception of the enamel in such a way as to leave cells separated from each other by narrow strips of the metal body. The Persians were acquainted with the *cloisonné* method, but the only historical evidences of their having practiced it in ancient times are two vessels—a cup and a ewer—belonging to the sixth and eighth centuries respectively. They brought the art to great excellence under Shah Abbas the Great at the end of the sixteenth and beginning of the seventeenth centuries, and continue down to the present time to enamel on gold and copper.

Long before these dates, enamel was known to the Egyptians, the Phœnicians, and the Etruscans, but not in the form now under consideration. We must come down to the first centuries of our era before any thing definite can be learned about *cloisonné*. It probably reached Byzantium from the East, and radiating from that city as a new centre, spread in course of time all over Eu-

rope. As Rome declined, the fine arts died away. But a revolution was at hand, and took place when the prospect seemed darkest. The two events mainly instrumental in effecting it were the conversion of Constantine, the first Christian who wore the imperial purple, and his removal, about A.D. 330, of the seat of government to Byzantium. He took with him the processes of Rome, which, being brought into contact with traditions reaching Constantinople from the East and from Greece, resulted in the art known as Byzantine. It was inevitable that enamelling should attract attention. Both Greeks and Romans had a decided fondness for mosaics, acquired from their Southern teachers; and it is probable that, inspired by Eastern models, they applied the Roman processes to a new kind of mosaic—*cloisonné* enamel. They had reached this point in the sixth century, and possibly earlier. Few examples of this branch of art belonging to the early Byzantine period now remain. The Byzantines used chiefly a base of pure gold, and the value—other than artistic—thus given their work reduced to a minimum the chances of its being preserved throughout the troublous times of the Dark Ages.

MODERN JAPANESE CLOISONNÉ ON METAL.

Their process is described by Theophilus, a monk who lived between the tenth and twelfth centuries, and whose work, *Diversarum Artium Schedula*, is a compendium of the industrial arts of his day. Very little is known with certainty either of his country or of the time in which he lived. His directions are well worth studying, as, while indicating a method very slightly different from that of the Japanese, already detailed, they are more minute, and explain what is essentially the practice of the present day. He gives full details regarding the cutting of the gold bands, soldering them to the surface of the metal excipient, pulverizing the colored glasses, placing them in the cavities formed by the filigree, firing the piece, and polishing the surface. One feature of his description is that the enamels were laid upon a plate of gold, which was subsequently fastened to the vase or other object to be decorated.

The art was practiced down to the fourteenth century; but events had transpired in the mean time which, while threatening the artistic supremacy of Byzantium, really extended its influence. Constantine exerted himself to embellish the city to which he had removed his throne, and under his suc-

cessors the Christian Church became the most munificent and enlightened patron of the arts. The religious strife which followed the death of Justinian is matter of history. The Iconoclasts builded better than they knew when they drove out the artists against whose works their zeal was directed. The latter dispersed themselves over Europe, and found in every land a welcome and an asylum. The Iconoclastic persecution thus became the indirect cause of the dissemination of the styles and processes of ornamentation it was meant to destroy. After the storm exhausted itself, the arts of Constantinople revived, and in the ninth and tenth centuries, under Basil the Macedonian (868–886) and Constantine Porphyrogenitus (911–959), were in a highly flourishing condition. The emigration begun under compulsion was continued by preference. The Greek artists travelled every where. The Saracens borrowed from the fountain-head, and initiated a style of almost unparalleled splendor. Venice sought Byzantine aid and propagated Byzantine styles. The "Scuola Græca" at Rome was founded for the reception of the fugitives, who again found themselves taken under the protecting wing of the Church. The Venetians carried their arts to Perigueux and Limoges, and thus established new centres. In the beginning of the eleventh century the Greek artists had penetrated Germany, and left upon that country a deeper impress than upon any other. Their arts conquered the Sclaves, and spread eastward through Asia Minor, Armenia, and the country lying near the Caucasus. From Armenia they reached Persia, which even down to the eighteenth century was indebted to Armenian enamellers. No line, in fact, can be drawn as the limit of Byzantine influence either in the East or the West.

OLD CHINESE CLOISONNÉ ON METAL.

Before the methods of Byzantium were transmitted by Venice to Central Europe, other enamelling processes than the *cloisonné* had been spread by the Phœnicians, and were known to the Gauls before the Roman occupation. It appears, further, that in certain sections new processes originated and passed away with their inventors, and for that reason historical inquiry is for several centuries attended with doubt. The great western emporium was Limoges. It may be said to be the only city in Gaul which relieved the gloom following upon the withdrawal of the Romans. During their occupancy it was a centre of trade and industrial art. In the tenth century (979) the Venetians had a dépôt at Limoges for the sale of articles brought from the East, which were thus distributed throughout Western France. The intimate relations existing between these two cities must undoubtedly have propagated both a taste for *cloisonné* enamel and a knowledge of the manner of its preparation. From the eleventh to the fourteenth century all the Limoges work shows Byzantine influence both in design and treatment. It did not assert independence until the art was revolutionized by the innovations which ended in the entirely new use of enamel found in the works of Penicaud, Courtois, and, greatest of all, Leonard Limousin.

A very rare kind of *cloisonné*—originally Persian, and subsequently Chinese—was made at an early date in Europe, and is called "de plique à jour." The enamels were melted in cells without any background, and were then set in compartments made for their reception in the object to be decorated. They may be described, from what they really resemble, as windows of translucent enamel. Reference to this variety will again be made in treating of China. Meantime this style is not to be confounded with that designated as "esmaulx de plique," or "émaux de plite." These terms were applied during the fourteenth and sixteenth centuries to that which is now called simply *cloisonné*.

In England the one name of Elkington will sufficiently represent the European *cloi-*

MODERN JAPANESE CLOISONNÉ ON METAL.

sonné enamellers of our time. Their process differs very slightly from the Byzantine and Japanese.

Turning next to China, the inquirer is usually confronted by dates which impose a heavy tax upon credulity. In handling their chronological assumptions, the best rule, therefore, is to exercise a wise discretion, and to lean a little in favor of modern dates whenever such a course is practicable. It is related that in the fifth century of our era a traveller reached China from the West. He is said to have come from Scythia, which M. Labarte interprets Persia. Arriving at the court of the Emperor, he proposed to teach the Chinese the manufacture of enamel. Following his instructions, search was made in the mountains for the requisite materials, and when they were found, the merchant succeeded in introducing the art of enamelling. No specimens are now in existence which can be assigned to so remote a period, modest as the assumption of such a date is when compared with the hoary antiquity claimed for other Chinese arts. We must step over the next thousand years, and reach the Ming dynasty (1368–1649), before any examples of a well-authenticated age can be found. So far as our knowledge extends, it is to this period and the next hundred years that the best enamels belong. Mr. J. Thomson states that the Ming enamelled vases are the oldest, and that the best belong to the Kien-long period of the Tai-thsing dynasty (1736–1796). He adds that the art was revived about twenty-five years ago.

The Chinese were acquainted with all the methods known to Europeans. Their old *cloisonné* enamels are in every sense admirable in workmanship, color, and very often in form. The broken shades are blended with a harmony so subtle that the eye is never displeased, even by the monstrous figures which Chinese religion and imagination call into being. Dragons with visages as terrible as the Oriental well-practiced artist can make them, with long horns that actually appear to quiver in the gloss of the enamel, with jagged fangs and eyes blazing with ferocity, roll over the vases and plaques in contortions suggestive alike of agony and power. Alternating with creatures so monstrous are flowers and landscapes colored in soft and satisfying hues of rose, pale blue, yellow, or pale green. If some of the vases are clumsy in shape, there are others which for symmetry and gracefulness of proportion will compare with the best works of the potters of Greece.

The *cloisonné* "de plique à jour" of China

MODERN JAPANESE CLOISONNÉ ON METAL.

includes some of the finest illustrations of workmanship and color. The process appears to consist of bending the metal wire into the requisite designs in the inside of a mould. The cells thus formed having been filled with the enamel powder or paste, the piece is fired, and then removed from the mould. Vases are thus made in sections without background, and these portions are soldered together. In colors and in processes there is often shown a remarkable affinity between the Chinese and European—notably the Byzantine—*cloisonné* enamels.

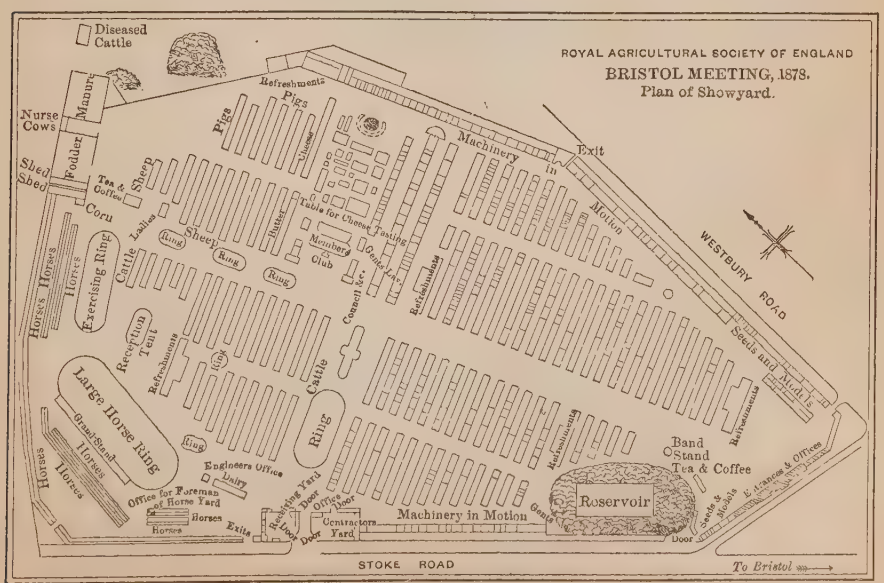
MODERN CHINESE CLOISONNÉ ON PORCELAIN.

From China we return to our starting-point in Japan. Putting aside fanciful legends, the Japanese acquired the art of enamelling from China about the same time that they learned how to make porcelain, *i. e.*, in the latter part of the sixteenth century.

The Japanese methods are almost identical with those of China. When copper, and not porcelain, is used as a base, the brass wire is first fixed by means of a kind of gum, to keep it in its place until the application of the wire is finished. A mixture of borax and brass solder is then applied, and the piece is fired so that the wire may be securely fastened before the cells are filled with the enamel pastes.

The old enamels are characterized by all the best qualities of the Chinese. The designs are partly of the conventional order and partly realistic. On a porcelain jar or vase a huge dragon appears, of the usual formidable type, and around it are rolling dark clouds like heavy smoke. On another is a landscape painted with all the sympathy which the Japanese artist expresses in his work. The subdued tone is not the result of a lack of brilliancy, but of skillful handling of colors and unerring taste in assortment. It is only upon inferior specimens that any thing like harshness or crudity is visible. The finer examples are rich and quiet in tone. The colors are mingled with a harmony so subtle that analysis can hardly discover whence it arises. A river is indicated by a few wavy threads of gold in white tinged with blue, and the empurpled hills fade away into the blue of the sky which forms the ground-color. There is nothing discordant even when the most brilliant effects are sought. In some pieces the artist concentrates his eye and hand upon the realistic: storks wade in a stream, and every feather, every scale on the long bony legs, is a cell filled with shaded enamel. The introduction of two colors into one cell is effected with a nicety at times marvellous, more particularly in flower pieces, where fine shading is essential to the perfect reproduction of the bloom of nature.

THE MEETING OF THE "ROYAL" ON DURDHAM DOWN.



HAVING long been familiar with agricultural exhibitions at home, both large and small, and having often read with interest the reports of "the country meeting," or annual show, of the Royal Agricultural Society of England, it was with much interest that I visited Bristol during the second week of July to see the contrast between their exhibition and ours, and to verify my preconceived idea of what the "Royal" show must be like.

Like all large towns in England, Bristol, in spite of much that is modern and busy, is full of antiquarian interest. The Church of St. Mary Redcliffe, of very ancient foundation, and completed in 1280, was said by Queen Elizabeth to be the most beautiful in her kingdom. It is a perfect specimen of Gothic architecture. The old houses of the "Horse Fair" are equal to the Rows of Chester in picturesque effect. The suspension-bridge over the river which borders Durdham Down, as well as the view from the down itself, suggests in a smaller way the bridge and river at Niagara.

The inclosure, about seventy acres in extent, covered a level stretch of the great common of Bristol—Durdham Down—near the beautiful suburb of Clifton. The temporary offices of the society and the wooden ring-fence had the same slight character with which we are familiar at home. The various sheds for implements, stock, etc., stretched out in parallel rows from each side of a broad central avenue, and ran along nearly the whole of the outer inclosure. They were generally frames of light timber, covered with canvas. Interspersed among them were tents and cheap wooden buildings for judges and officers, for members of the society, for restaurants, for drinking booths, etc. Here and there were rings for the examination of cattle, a larger one for agricultural horses, and a still larger one, with a grand stand adjoining, for the examination of pleasure-horses and for the general exhibition of live stock. The immediate impression was that of a most orderly and imposing gathering of the means and results of a gigantic industry.

We have in America no agricultural show quite comparable with this one. The St. Louis Fair comes nearest to it, but it lacks some of its more impressive elements, and it adds very much which has to do rather with mechanics than with agriculture, and a conspicuous element of art and domestic industry, which here is absent. The St. Louis Fair would very fairly represent the English show if, without losing size, it gave up all collateral branches, and were occupied entirely with what relates to agricultural and purely country life. Indeed, the English show departs from the agricultural line only by the exhibition of carriages and a few articles of domestic economy which are not specially confined to farmers' households.

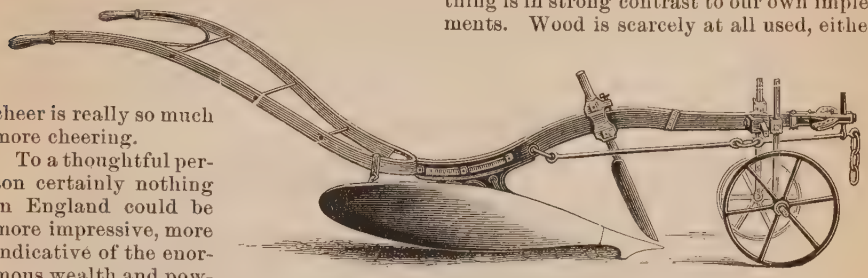
The administration of the show is most perfect. The space is large, the sheds and show rings are admirably arranged, and in every department it is evident from the outset that the management is working with the light of long experience. The catalogue is printed almost at the very last moment;

its numbers are all consecutive, and there are astonishingly few exhibits recorded which are not present on the ground. The prize lists in the various classes are conspicuously posted the moment the judges' awards are announced.

The managers of the grounds and the groups of judges were assisted on this occasion by a swarm of boys from the training ship *Formidable*—neat and active fellows, in their sailor dresses, distributing badges, carrying messages, and giving efficient help in all matters of detail. The exhibition was quite ready at the time announced; every exhibit was in its place and ready for inspection. In no single department during the whole week of the show was there the least suggestion or sign of confusion or hurry; and so far as the crowd permitted, even on the cheap admission days, it was easy to inform one's self concerning every object.

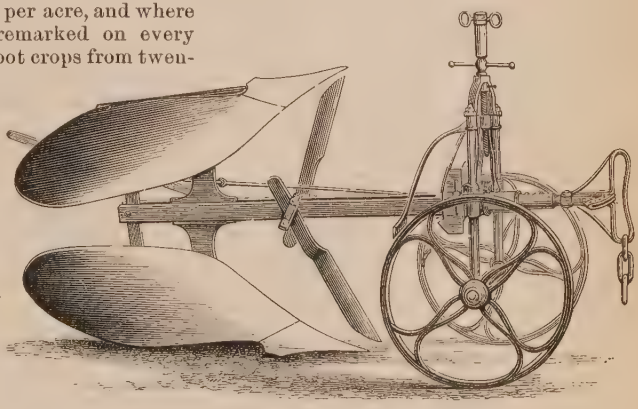
To an American the most interesting feature of the show was, of course, the people—the people from whom we have sprung, whose cousins we are, and who, while having undergone some modification by the civilizing influences of modern times, remain far more nearly like our ancestors of two hundred years ago than is any class which we have to show. Costume has fled in England, as elsewhere, before the advance of the railway and the tourist, so that there was not much that was noticeable in this regard. Farmers' wives and daughters, and even dairy-maids and house-servants, have little in their dress to distinguish them from their betters: here and there a carter's frock, and quite generally the breeches and leggings of the grooms, constitute about all that is left in the way of class dress. If peculiarities of speech yielded as readily as peculiarities of dress, one might easily fancy one's self in America; but peculiarities of speech are far more stubborn, and whether in the lower and richer intonation of educated persons, in the absolute absence of h's among the multitude, or in the strong local dialects of twenty distinct peoples from different counties, one felt a very foreign influence.

Another peculiarity was the enormous amount of drinking, men and women—of many classes, too—crowding about the numerous large booths where beer and spirits were sold. I can recall no instance where, at an American agricultural exhibition, any sort of intoxicating drink has been sold within the inclosure. Here it was sold universally and consumed enormously. Such an amount of such beverages would drive an American crowd beyond the limits of decency, and quite beyond the control of the police; here it had no more effect than so much water; and no crowd in America, under the most favorable circumstances, could be more orderly or more self-respecting than were the thousands who were gathered together on Durdham Down during the week of the "Royal" show. Whether or not it is an evidence of civilization for a nation to be able to drink so hard and to carry its drink so stoutly it is not worth while to discuss; it may be due to a peculiarity of climate, to the constant out-of-door exercise possible to this whole people, or to the long habit of many generations; but whatever the reason, one might, so far as this show ground was concerned, have gathered the impression that there is less drunkenness here than in our State of Maine, where the sale of even the lightest beer is a penal offense.



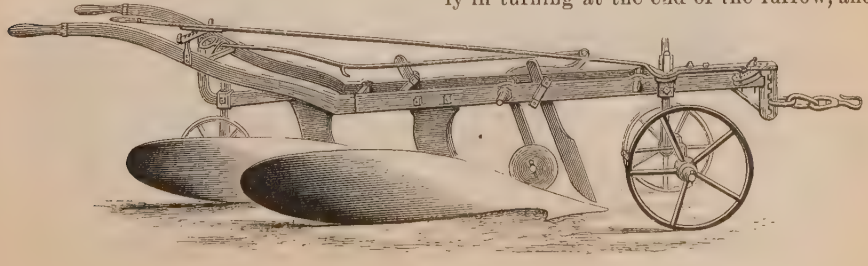
It is another striking peculiarity of Englishmen, and, to a stranger, one of the curious exhibits of the show, that vigorous, healthy, and wholesome appetite should make men—and women too—so indifferent to the modern art of good cookery. That a nation should have reached the state of prosperity of Great Britain, and still content itself with such bread as is universal here, is astonishing to those who have known civilization in other parts of the world. That, with a climate admirably suited to the growth of nearly all vegetables, a people numbering forty millions should subsist mainly upon potatoes and the various families of the cabbage as their chief vegetable diet, is indeed odd. Now and again one may get on very well with a costly mid-day luncheon of cold meat, cheese, and iced claret, and for a show ground such mid-day diet is well enough; but that a people by no means deficient in æsthetic cultivation should go from the cradle to the grave ignorant of what their neighbors across the Channel regard as the necessaries of a pleasant life, is little less than amazing.

I think we have an impression in America that an English crowd is rough, surly, and brutal, and in no way comparable to an American crowd. It seems to me that this idea is as mistaken as is our belief in what is known as the "rousing British cheer." We were well placed in an enormous crowd lining the main street of Bristol during the procession of the Prince of Wales from the railway station to the show yard—a crowd which had stood its ground for hours under circumstances which might well develop any tendency to roughness or rudeness. There was a certain amount of chaff and wit and boisterousness, but all was good-humored, cheerful, and pleasant, very much what one would see in Broadway on a similar occasion—what, indeed, we did see when the Prince paid us his visit in 1860. But when he finally appeared, and the obvious enthusiasm of the people attempted to find expression in a cheer, it seemed to us that he must still remember



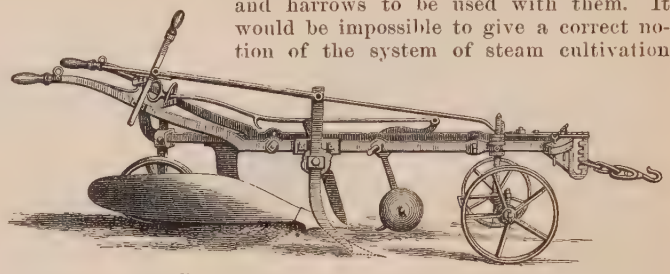
with regret the ringing salute which followed him in New York through a similarly packed street. It almost excuses our harsher voice and shriller key to know that our cheer is really so much more cheering.

To a thoughtful person certainly nothing in England could be more impressive, more indicative of the enormous wealth and power of the people, than the collection of animals and implements gathered together at this annual show. Travelling through the country in this harvest season, surrounded on every side by an agriculture with which we have nothing to compare; passing hundreds and hundreds of large fields of wheat which can hardly yield an average of less than thirty-five bushels per acre, and where uniform excellence is remarked on every hand; among fields of root crops from twenty to one hundred acres in extent, absolutely clean, and absolutely unbroken in their uniformity of growth; where the grass during the hay harvest suggests the Irishman's pig, which was "tallest when he was lying down," so heavy a swath does the apparently slight growth make — one hardly wonders that an area not larger than the States of New York and Pennsylvania should hold a population equal to that of the whole United States; but one needs to see gathered together within the reach of an hour's walk specimens of the men and the tools and the animals by which this cultivation is carried on, to realize how very far beyond our best standard is the almost universal cultivation of this remarkable land.



In the matter of ploughs especially, every thing is in strong contrast to our own implements. Wood is scarcely at all used, either for beams or for stilts, the whole implement being of iron. There are a number of makers who exhibit very largely; prominent among them are J. and F. Howard, of Bedford, who exhibit twenty-six hand-ploughs of all sorts. I give an illustration of their regular form of plough (A) for ordinary use, of a swivel or side-hill (or one way) plough (B) of peculiar construction, and of their great specialty, the double plough (C), sometimes also made treble. This double plough is drawn by four heavy horses, is so arranged that its working is extremely easy, especially in turning at the end of the furrow, and

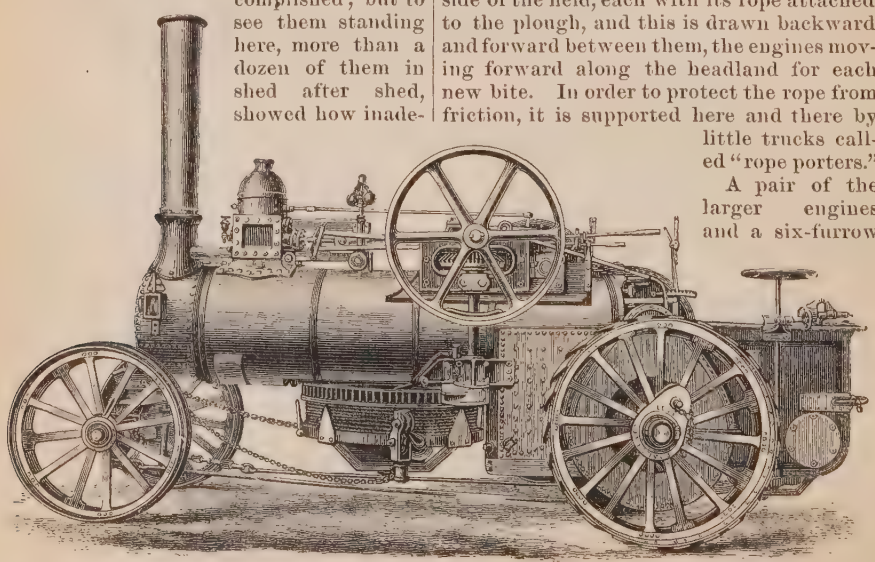
A.—PLOUGH FOR ORDINARY USE.



B.—SWIVEL PLOUGH.

C.—DOUBLE PLOUGH.

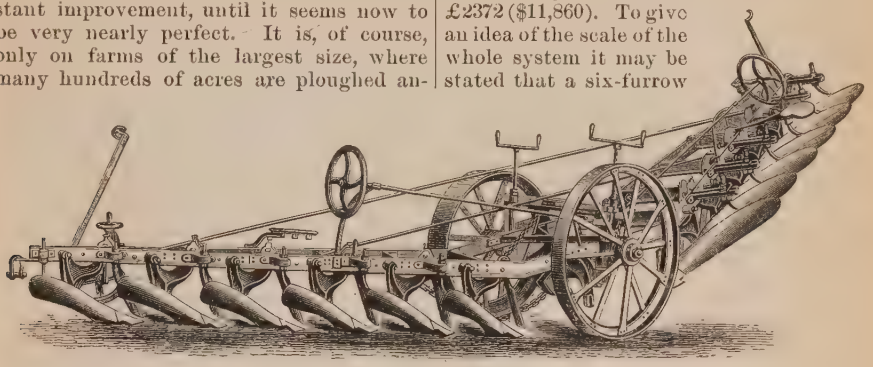
it is considered, so far as I can learn, a very perfect implement for use on land which is in good order. Where it is desired to break up the sole of the furrow or to do deeper subsoiling work, the right-hand plough is removed, and a subsoiling prong, as shown in another illustration (D), is substituted for it. This loosens up the bottom of the furrow, and the left-hand plough throws the furrow slice upon it. It is one peculiarity of these ploughs that the wheel—the top of which appears above the left-hand mould-board, and which takes the place of the land side—is set at an angle, and takes the side thrust of the implement. These ploughs are all very much heavier than ours, and appear to be much more cumbersome. As seen in operation in the field they appear to be entirely satisfactory and to do excellent work. I have found them in use in Canada, where our own lighter ploughs had been given up as inferior to them. One comes to believe, however, on proceeding further, that all these hand-ploughs are destined to be relegated to a very secondary position, for use in small fields and odd corners.



D.—DOUBLE PLOUGH WITH SUBSOILER.

Whatever may be the objections to the use of the steam-ploughs—and they are fast being overcome—they impress the unaccustomed visitor with great force. I had read of them and had seen pictures of them, and knew of the amount of work that they accomplished; but to see them standing here, more than a dozen of them in shed after shed, showed how inadequate had been my preconceived idea concerning them.

John Fowler and Co., of Leeds, show several sets of apparatus with engines of from six to twenty nominal horse-power, with the gang-ploughs, grubbers, rollers, cultivators, and harrows to be used with them. It would be impossible to give a correct notion of the system of steam cultivation without quite full illustrations. In Fowler's system two engines are used—engines which are capable of travelling on the road, moving about the fields, and carrying their apparatus with them. Under the boiler a horizontal drum carries a steel-wire rope, by which the plough is drawn. The plough, which turns from four to eight furrows, according to the power of its engine, is a gang of ploughs attached to an iron frame, and so balanced that as it proceeds in either direction the gang which is to make the reverse cut is cocked up in the air. The ploughman sits over the centre of the gang, and has in front of him a steering windlass, by which the direction of the plough is regulated. The grubbers, cultivators, harrows, subsoilers, etc., are all arranged in a similar way.

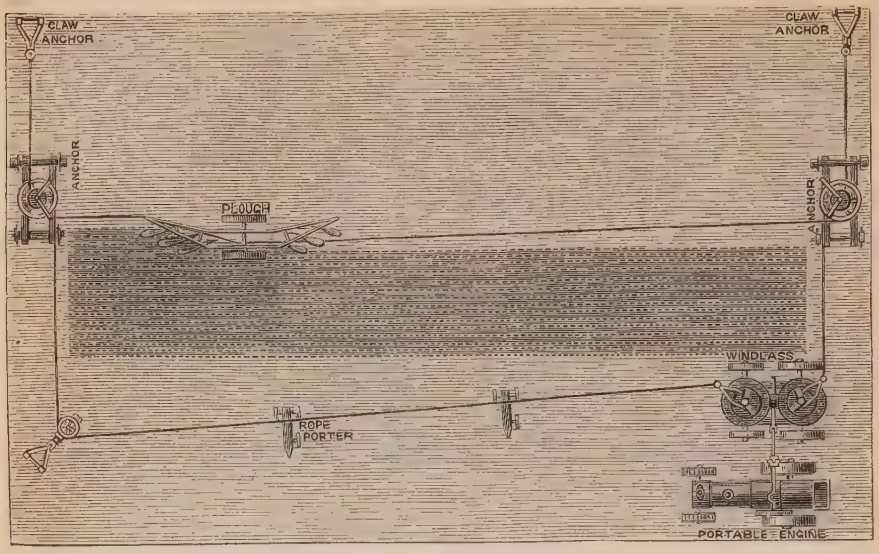


When at work, one engine stands at each side of the field, each with its rope attached to the plough, and this is drawn backward and forward between them, the engines moving forward along the headland for each new bite. In order to protect the rope from friction, it is supported here and there by little trucks called "rope porters."

A pair of the larger engines and a six-furrow

E.—SINGLE-CYLINDER STEAM PLOUGHING ENGINE.

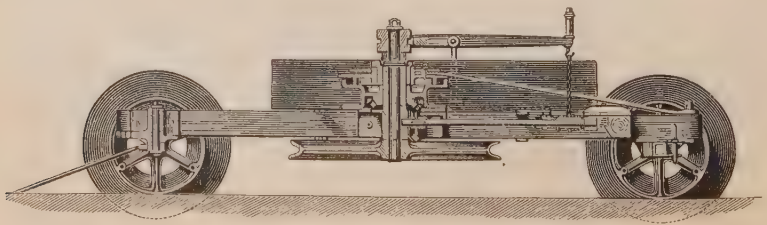
plough will turn up from fifteen to twenty acres per day, almost irrespective of depth, within any usual agricultural limit. The system has been in practical use for twenty years past, and has been undergoing constant improvement, until it seems now to be very nearly perfect. It is, of course, only on farms of the largest size, where many hundreds of acres are ploughed annually, that these large double-engine sets of apparatus are used, but there are companies and associations of farmers in all parts of England which own one or more sets to be let out for hire, so that even a small farmer may have his ploughing done by steam at a cost much less than that of doing it by horse labor, when it is considered that he is relieved from the cost of maintaining his horses throughout the year. The mere matter of economy, however, is a secondary consideration as compared with the quality of the work done. The greater speed of the steam-plough gives a much more thorough pulverization and aeration to the soil, the treading of horses' feet is entirely done away with, and the condition of the land generally is greatly improved, especially as the subsequent operations may, where fields are sufficiently large, all be done by steam — harrowing, rolling, and seed drilling. Indeed, the only drawback to this system seems to be the very large amount of capital that it is necessary to invest—a pair of twenty-horse-power traction engines, an eight-furrow plough, and 800 yards of steel rope costing no less than £2372 ($11,860). To give an idea of the scale of the whole system it may be stated that a six-furrow balance-plough is about thirty feet long, and weighs over two tons. Messrs. Howard's prices are relatively about the same.



F.—BALANCE-PLOUGH.

Both Fowler and Howard manufacture apparatus for working with a single engine. The arrangement of this is shown in G. The engine and windlass are placed upon one of the headlands. On each headland there is an anchor carriage, the construction of which is shown in H (sharp disk wheels cutting deeply into the ground). The plough is drawn between the anchors, and as the work progresses the anchors move forward for each new bite. After the main body of the field is ploughed, the tackle is put in position to plough the headlands, and after the work is completed, the anchors and the plough are hauled back to the windlass by the ploughing ropes, and the field is cleared of the whole tackle without the aid of horses. This system can be well worked with the aid of two men and one

STEAM-PLOUGHING.



G.—APPARATUS FOR WORKING PLOUGHING ENGINE.

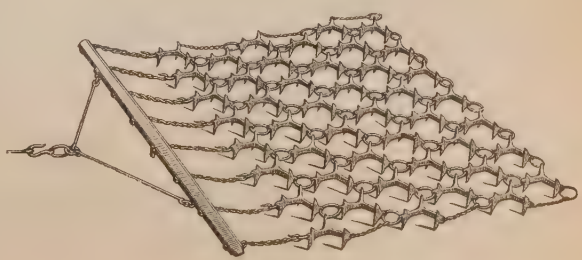
boy (to look after the ropes), and the cost of the apparatus complete hardly exceeds £1000 ($5000).

How long it will be before steam-ploughing becomes at all general in the United States it would be rash to guess. The few trials that have been made were undertaken before the system had reached any thing like its present completeness, and in one instance at least the local conditions were not favorable for it. The only absolute requirements here seem to be the absence of large stones, a general smoothness of surface, and large inclosures—not less than ten acres, and, preferably, more. It seems to work as well on rolling lands as on plains, and its use is rapidly increasing from year to year, not only in Great Britain and Ireland, but in the colonies as well. One would suppose that on the large farms of the West and Northwest steam-ploughing should find its most favorable field. During our war, when American cotton was shut out from the market, Egypt was enabled, by the use of imported English steam-ploughs—making their steam by imported English coal—to produce a large supply with great profit.

The economical question is not that with which we now have to do so much as the mere question of interest to the visitor: undoubtedly any American farmer visiting Bristol would have had his attention more attracted by these majestic implements, standing in the exhibition sheds and working on the trial ground close by, than by any other feature of the show.

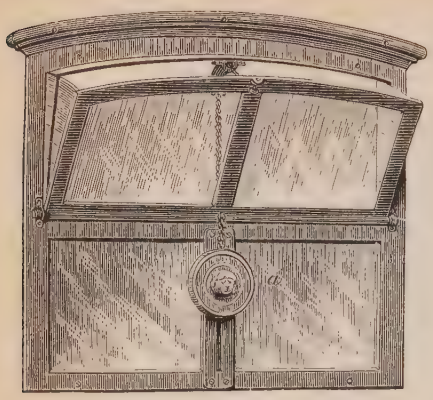
Among the minor features of the show of implements there was a great deal which, in a more extended description, would be well worthy of notice. The tools generally have, to an American, an unfamiliar look. They are heavier, and as a rule less gracefully formed. Some novelties seemed to me important. Among them Decauvilee's portable tram-way, manufactured by Fowler. This is a railway of sixteen-inch gauge, made in lengths of from four to sixteen feet, and weighing, with the iron cross-ties and fish-plates, about four pounds per foot. The rails are fastened together by flat iron cross pieces four feet apart. Through these cross pieces there are holes by which the iron may be fastened to a timber bed to make a permanent road. But this is found not to be necessary, save on very soft ground. The

H.—ANCHOR.



PORTABLE TRAM-WAY.

fish-plates are so arranged that the line can be laid by simply slipping them together, making a perfectly rigid joint. The portability of the apparatus is so great that, in harvesting turnips, for example, four men can take up, move, and relay a quarter of a mile of railway in an hour. Curves and turn-tables and switches are furnished for various requirements, adapting the apparatus to all circumstances. The portable turn-table weighs only 170 pounds. The wagons are light, running on four wheels, and calculated to carry from 300 to 2000 pounds. The railway, when temporarily laid on uneven ground, will carry from 800 to 1000 pounds. Special purposes served by it are the carrying out of manure and drawing home of crops, etc., and it is particularly advantageous for use on land so wet or heavy as to be injured by horses' feet. The cost of the straight double rail is about thirty cents per foot. Wagons to carry 1200 pounds cost about thirteen dollars.



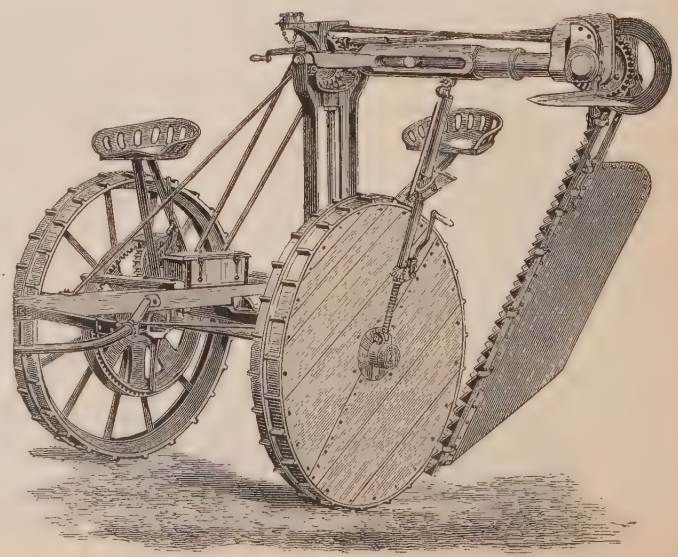
Conspicuous among Howard's exhibits was his flexible harrow (I), which is to be obtained in New York, and which I have found by long experience to be not only a good harrow for grass, as the inventor claims, but the best general harrow that I have tried, especially for use upon uneven surfaces and among stones. It is particularly good for distributing manure in grass land and for scratching the surface of old pastures.

Musgrave's stable fittings seem to have reached the very acme of perfection in all details of the horse or cow stable. Vitrified, channelled brick paving, perfect drainage, accessibility for cleaning, excellent systems of ventilation, balanced and noiseless tying apparatus, hay racks easily cleansed, mangers in which an iron rack lying on the hay prevents the horse from tossing it about and wasting it, water troughs which are easily emptied and cleansed, and grain boxes from which the grain can not be thrown out by the horse's nose, are some of the items of their improvements. Many of these improvements are only modifications of appliances with which we are already familiar; but the ventilating window (J), opening inward at the top, and held at any desired position by a counterpoise, shown at *a*, seemed to me as original as it is good.

A great variety of dairy apparatus was tried by the judges in a very thorough manner. That exhibited by Edward Ahlborn, of Hildesheim, Germany, was, as a whole, the most successful; and the best item of his exhibit was a rotary butter-worker which was used in America before the date

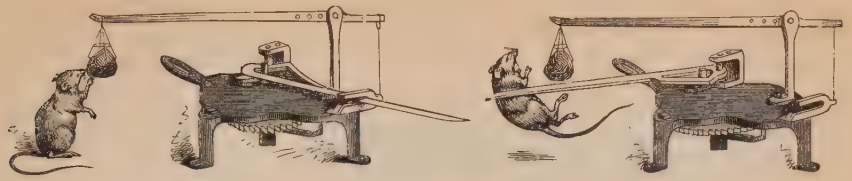
I.—FLEXIBLE HARROW.

J.—VENTILATING WINDOW.



of his original patent—a regular case of "adaptation."

Throughout a large part of England the use of live fences, or hedges, is almost universal, and an enormous amount of labor is annually expended in trimming them. In some parts of our Western country they are coming into such general use that any successful implement for hedge-trimming has almost as great an interest for us as for English farmers. Hornsby's hedge-trimmer, working on the principle of the mowing-machine, but with its cutter power so arranged as to cut at any angle, is said to be entirely successful. It was on trial near the show yard, and did very good work at a rapid rate, cutting the top or either side of the fence as well. In the illustration the knife is placed to cut the near side of the hedge. The arm is easily raised and extended, and the angle of the cutter bar changed to cut the other side as well.



Of gimcracks there were not nearly so many as one is accustomed to see at our exhibitions; but I was particularly struck with Ransome's rat-trap, which was exhibited with blocks of wood substituted for live rats. It is an innocent-looking affair as set, but at the first nibble a knife flies forward, decapitates the rat, and throws him some distance away, and immediately sets itself again, so that its capacity for destruction is measured only by the supply of rats.

Lewis's sack-lifter truck has the ingenuity of a gimcrack and the usefulness of an implement. By turning a crank at the side of the handle the load is raised to the height of a wagon body or of a man's shoulder.

Sutton and Carter and the other great seedsmen were present in force, and with a display of prodigious mangels, enormous Swedes, and mammoth products of all varieties, making a very attractive exhibition. Perhaps it is because our Indian corn is so easily grown and produced so largely, or because our land is generally too foul, or our labor too scarce and costly for us to grow roots successfully, but, whatever the reason, any American farmer visiting England must be impressed with the great extent to which roots are there produced, and with the large crops grown. They seem to be the sheet-anchor of English agriculture. Another instructive element of the seed show was in the matter of grass seeds. All of the seedsmen have a great number of "mixtures" for different purposes and for different kinds of land. As an example, I extract the following from Sutton's catalogue: "We specially prepare mixtures for the following surface soils, which are to be found on almost all the geological formations: good medium loams, stiff clay soils, clay marls, black peaty soils, heavy loams, medium clays, chalk marls, brashy soils, light loams, light sands, light gravel, chalky soils." Their mixtures of permanent grasses and clovers for any of these soils include from fifteen to twenty-two varieties, the amount per acre being two bushels of grass seeds and twelve pounds of clovers, and the cost for the best quality

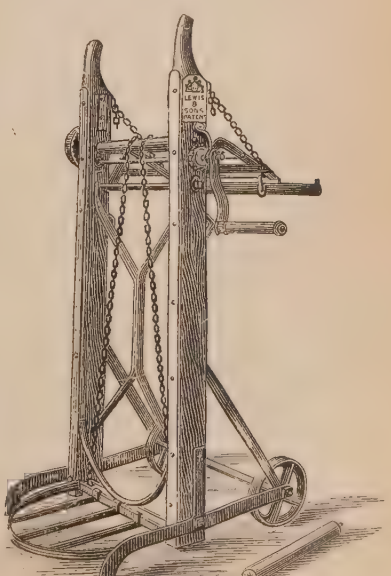
K.—HEDGE-TRIMMER.

RANSOME'S RAT-TRAP.

between eight and nine dollars an acre. Doubtless the superiority of English hay and the great permanence of English meadows are largely due to this combination of varieties, as well as the adaptation of varieties to soil. It is in strong contrast with our quite general custom of using timothy, redtop, and clover on all lands.

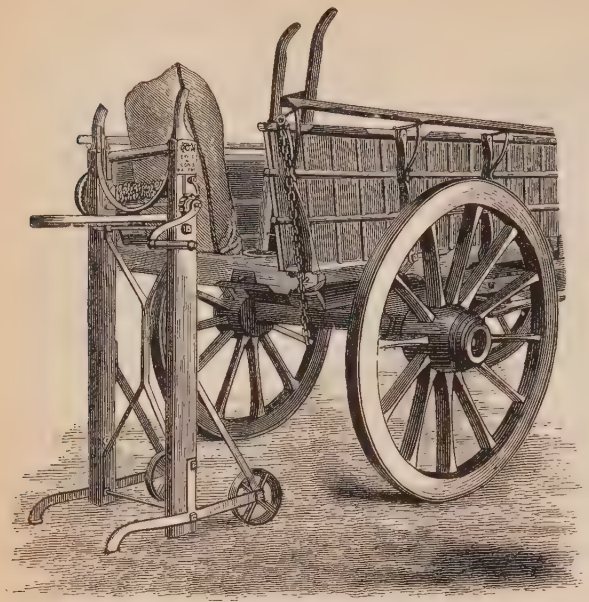
In the live-stock classes this show was engaging far beyond my expectation. These classes include the following: agricultural horses, thorough-bred horses, ponies, hunters, hackneys (ordinary riding-horses), and, oddly to us, not one pleasure driving horse.

Short horns: Herefords, Devons, Sussex cattle. Long horns: Jerseys, Guernseys, and Welsh black cattle.



Of sheep: Leicesters, Cotswolds, Lincolns, Oxfordshire Downs, Southdowns, Shropshire, Hampshire Downs (long wool), Somerset and Dorset (horned), Dartmoor, and Exmoor.

Among swine the classification known in America is not followed, Berkshires being the only named breed. Aside from these there were "small black breed" (our Essex), "small white breed," and "large white breed."



The show of horses was very large and very fine, no fewer than three hundred and fifty entries appearing in the catalogue, and hardly one absent from the stalls. In the hunter class alone there were over eighty, and eighty such horses, it is quite safe to say, as were never seen together out of England—high-bred, mettlesome, clean-limbed, strong-boned, glorious-looking animals, in the finest condition and the finest spirit. There were twenty-six four-year-olds in the ring at one time, and their examination occupied nearly four hours; first nine were thrown out, and then ten, and then came a contest of nearly two hours between the remaining ones, at all paces, under different riders, and with the most careful and critical examination, and evidently very far from an agreement in the minds of the judges. When at last the colors were assigned, and the winners rode out of the ring, it was plain to see that the successful animals were quite worthy of their honors, but by no means clear that injustice had not been done to their equals.

To one having a real fondness for fine saddle-horses the temptation is strong to go on and fill column after column with descriptions of individual animals where there were so many of astonishing excellence, but my purpose being rather to give the impression of the agricultural show at Bristol upon an American farmer, as a farmer, I must leave this branch of the subject with the simple remark that the breeding of fine hunters is, with many farmers, a regular branch of their business, success in this breeding producing a capital profit. Even an ordinarily good hunter is quite sure to be worth from five hundred to seven hundred and fifty dollars, and two or three thousand dollars for perfect, strong, weight-carrying horses, well trained and with good temper, is by no means unusual. Incidentally the farmer gets out of the breaking and training of his young horses a great deal of good riding which he otherwise could not afford, for to succeed well in this business one must be a good cross-country rider, and show his animals in the front flight of the field.

The agricultural horses were, as animals —as examples of success in an effort to produce an enormous growth, and to lay on mountains of flesh—simply amazing. Whether they are especially good as horses may well be questioned. The Clydesdales, Suf-

L.—SACK-LIFTER.

M.—LOADER AND UNLOADER.

folk. Punches, and other heavy cart-horse breeds, seemed to me to be far too ponderous, too costly to keep, too slow in their movements, and too dull to be economical. That an English farmer should be very proud of a fine team of large Suffolks or Clydesdales one can very well understand, but it may fairly be questioned whether two-thirds of their weight of well-bred, quick-stepping, wiry American horses would not be more cheaply kept, and whether they would not more than make up for their lack of strength in the rapidity with which they would perform their work. The same idea has more than once occurred to me, as I have seen these teams drawing heavily loaded carts over country roads, or turning at a slow pace a furrow no deeper than we at home are accustomed to turn with the same number of animals. Certainly, for our hot climate, such horses are by no means to be recommended, and they would be quite useless for the ordinary market-work, church-going, and visiting, which with us the plough-horses are quite capable of performing. Nevertheless, whatever criticism one may make as to the economical value of the agricultural horses shown on Durdham Down, they certainly must elicit the warmest admiration of all who regard them simply as fine animals.

The nine-year-old Clydesdale stallion Topsman, shown by Mr. James Firth Crowther, of Knowle Grove, Mirfield, Yorkshire, which took the first prize in his class, is by far the finest bay horse that I ever had the satisfaction of examining. After spending some hours in the ring and sheds where these superb-looking horses were shown, I was quite surprised to hear two well-dressed and evidently prosperous farmers bewailing the fact that "it is all hup with 'orses—there is not one left in Hengland fit to look at."

Of thorough-bred stallions suitable for getting hunters, twelve were shown, and a fine lot they certainly were. It was with no little satisfaction that I saw the red rosette (first prize) assigned to Preakness, bred by Mr. Alexander, of Kentucky, and long owned and successfully run in America and here by Mr. Sanford.

At the other end of the line came the ponies—ponies from Wales, from Exmoor, from Scotland, and from all England, north and south, to the number of over fifty. They were of all sizes, from fourteen hands down to the smallest Shelties, and they constituted much the prettiest element of the whole show, with the single exception, perhaps, of the first prize aged hunter, Gentleman, a dark bay gelding exhibited by Mr. John Goodwin, of Cheltenham, the most taking horse, to my taste, that I have ever seen—prettier, better, and handsomer.

The great show—that which elicited the greatest attention and notice of the agricultural visitors from the beginning to the end of the week—was of course the short horns. The short horn is clearly the typical animal of Great Britain, in that he succeeds in cramming more solid flesh inside of one hide than any of his competitors. To my notion he is a limpy, loggy, misshapen, disproportioned, awkward, stupid brute, stuffed with fat and red meat like a sausage, and attractive only when in his show condition; his really beautiful skin and silky coat are then in perfect glistening order. Still, this is an individual and, I confess, a prejudiced opinion, which is entitled to no weight, and which is offered purely for my personal gratification. In England especially, and to a very great degree the rest of the world over, the short horn in his fattest condition is regarded as the finest of the animal world. Holding him myself in slight personal regard, I am quite disqualified from offering any comments concerning the individual animals in question. The English papers speak of them as disappointing; in what respect I do not quite understand, for certainly, as compared with animals in Ameri-

ca for which English breeders pay fabulous prices, I saw no such inferiority as should lead to this criticism, and to my eye—judged as short horns—the whole show was really superb. Among other breeds the Devons were very disappointing, the type having changed entirely since the importations into America of twenty or thirty years ago, the blood-like, active, spirited look being entirely lost, and the whole conformation and manner of all the animals exhibited indicating, as it seemed to me, a very unsuccessful effort to approach the short-horn standard. The long horns and Sussex animals were curious and apparently good, but the most interesting of all the unfamiliar breeds were the Welsh blacks, which have recently been brought into notice and improved by careful breeding, and raised to a very high degree of excellence. They are said to be fine milkers, they reach maturity at a satisfactorily early age, feed well, and carry their flesh at the right points. Their friends claim for them that they have made an advance, during the short time since their improvement was undertaken, quite equal to the early progress of the short horns.

Of Guernseys there were shown seventeen head, nearly all imported, and all very fine —finer than the best seventeen that I saw a few years ago in a careful examination of the herds of the island. Beautiful they are not, even when polished and overfed for exhibition, and it is very doubtful whether their misshapen heads will ever take a blood-like form. Good as farmers' cows they certainly are, and evidently very good feeders when their fattening time comes.

I had looked forward with great interest to the exhibition of Jerseys, having been struck by the high prices paid at several of the recent public sales, and knowing the great care which Jersey breeders in England have long bestowed upon the development of the race. I had also long known that the question of *color* was made a leading object in all of the celebrated English herds, and I had always cherished the theory that the adoption of the color standard must necessarily lead to a deterioration of quality; yet with my mind fully prepared for this result, I was quite surprised to see the degree to which the fear had been realized. For color effect, especially at a distance of a quarter or half a mile, only a herd of deer could compete with the solid-colored Jerseys which constituted almost the entire exhibit at Bristol, but on closer examination it seemed to me that they had lost even their native deer-like look—had lost, indeed, very much of the characteristic Jersey type. The short-horn standard seems to have fixed itself so firmly in the mind of this nation that the least departure from it is to be avoided so far as possible. The Jersey, as we know her in our best American herds, and under her best development in the island, is a delicate, thin-skinned, thin-shouldered, straight-backed, rather lean beast, carrying her beautiful head lightly and gracefully, with a neck almost like a deer's. She stands generally among horned cattle as the thorough-bred stands among horses. Many of the Jerseys to which the judges awarded prizes at Bristol were heavy-horned, thick-shouldered, tough-hided, coarse-haired, fat creatures, looking like a small short horn bred to the highest standard of fatness, and colored uniformly gray, with black tail and feet. They may be very fine animals for the purpose for which they are kept, but they certainly can not be particularly good for any agricultural use. They deserve to be regarded, so far as the money-making farmer is concerned, very much as the "hunter" horses are regarded, that is, as a source of profit because of the high prices for which they may be sold to those who want them for a purely fancy use. That they will ever assume any thing like such importance among the butter-making farmers of England as their better-developed sisters have done among the butter-making farmers of America, is hardly to be hoped. One almost questions whether it would not be a good business undertaking to establish a herd of the best *dairy* class of Jerseys in England, and seek a market for their increase among those who make fine butter for the London market. This has been done in America with the result of securing prices far beyond any thing ever paid in England—prices which neither in America nor in England could in the present state of affairs be approached by animals bred only for a fancy demand.

These remarks apply to the exhibit of Jerseys as a *whole*. It would take very much more than the fifteen or twenty years during which this color fashion has prevailed in England to spoil such a race as the Jerseys. A very large number of the fifty-five animals shown carried the excellence of their race so strongly that overfeeding had failed to cloud it, while there cropped out here and there enough white to recall the richness of the older Jersey breed; indeed, there were several animals at the show which would have been well worth the cost of bringing to America; but, so far as I can recall, in only one or two cases did cattle of this type receive either prize or commendation at the hands of the judges.

The Royal Agricultural Society has been such an efficient instrument in the elevation of English farming to its present high condition that its history is worth considering. Its work has coincided with the general progress due to the railroad and the printing-press, which have, of course, been most important factors in the problem; but it is beyond dispute that the present result

could not have been attained without the intelligent and well-organized guidance of a society which has commanded from the outset the active co-operation of the first men of the land.

England has no Department of Agriculture, nor any form of governmental organization having the encouragement of agriculture for its object. Certain statistical work is done, and more or less of sanitary and judicial control is exercised, by the Board of Trade, the Privy Council, and the Enclosure Commission; all else is left to private and associated undertaking. There are many local societies throughout the country, but the "Royal" holds a high preeminence. The local societies are quite independent of it, and they hold their own annual exhibitions, save when the peripatetic national society comes into their neighborhoods, when they suspend their own shows and contribute in prize-money and otherwise to its success. The "Royal" receives no subsidy of any sort from the government, but depends entirely upon the contributions of its own members. The show is sometimes profitable, and sometimes otherwise. Practically the dues received from its members and the interest on its invested funds are its only income. It was first organized in 1838. In 1840 it received a royal charter, which specifies the following national objects to be prosecuted by it:

1. To embody information from agricultural publications and scientific works useful to the cultivation of the soil.

2. To gather information from other societies at home and abroad which may lead to practical benefit to the farmer.

3. To pay the cost of experiments which may lead to useful results.

4. To encourage men of science in the investigation of various branches having relation to agriculture.

5. To promote the discovery of new varieties of plants useful in agriculture.

6. To collect information in regard to forestry, fences, and rural affairs generally.

7. To take measures for the improvement of the education of those who depend upon the cultivation of the soil for their support.

8. To improve the application of the veterinary art to cattle, sheep, and pigs.

9. By the distribution of prizes, etc., to encourage the best farming and the improvement of live stock.

10. To promote the comfort and welfare of laborers, and to encourage the improved management of their cottages and gardens.

All matters relating to politics are by the charter rigidly excluded.

The government of the society is extremely simple and conservative, the members having no other authority than the election of the council, which has the sole management of the funds, income, and affairs of the society. Members may criticise the action of the council at the general meetings, but they have no ability to interfere with the details of the management.

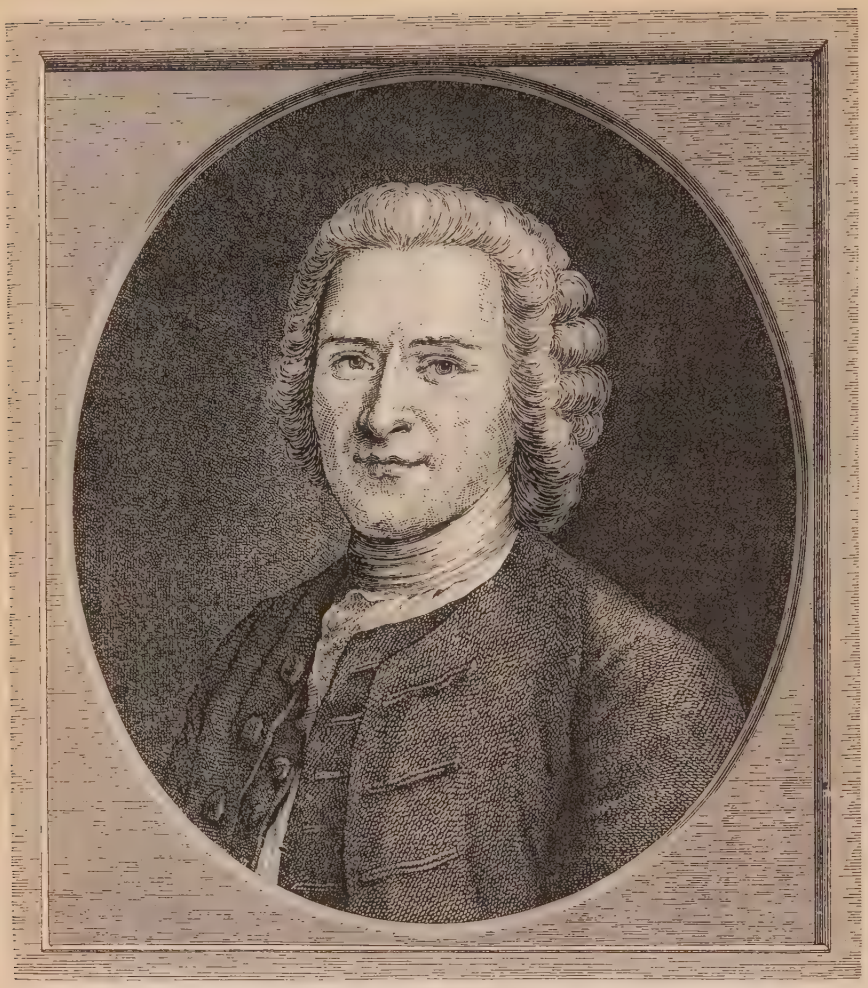
The total membership in December, 1877, was 6634, and the annual dues of this number of members, at one pound each, constitute the chief income, amounting to something over $30,000. Of this about thirty-three per cent. is consumed by current expenses; twenty-two per cent. by the society's Journal; twenty-five per cent. by the chemical, botanical, veterinary, and educational departments, and by certain special grants; and about twenty per cent. by the average loss on the annual show, which is profitable or otherwise according to its location. The society is not a money-making organization, and it frequently holds its exhibition where a loss is quite inevitable, for the sake of the benefit to be conferred on the adjacent farming community.

The steady advancement in the extent of the exhibition is a very good index of the growing importance of the organization. At the Oxford exhibition, 1839, there were twenty exhibitors of implements. At Oxford, in 1870, the number of these was 359. At the first show there were about one hundred exhibits of live stock; these now number about two thousand. At Liverpool, in 1841, the show ground covered about seven acres; at Liverpool last year, and at Bristol this year, about seventy acres were occupied. In 1853 (earlier years not reported) the visitors numbered 36,245; in 1877 they numbered 138,354.

The most noteworthy achievements of the society have been in connection with the improvement of cattle, sheep, and swine, and with steam cultivation, in both of which fields it has obviously been a most effective instrument in accomplishing results of immeasurable value to the agriculture of the world. Hardly less important, even though less conspicuous, has been the work of its chemical, natural history, and veterinary departments—work the record of which has done very much to give to the society's Journal its pre-eminent position in agricultural literature. In all of these departments the influence of the society on the popular mind, and consequently the wide extension of its benefits, have been greatly furthered by the degree to which men of the highest rank and standing have lent their names and their efforts to its success. Its "Royal" element has always been conspicuous and always useful.

That part of Greater Britain which is too remote for personal contact has still very much for which to thank this society in its really admirable publication—the Journal—which has from the first been the most valuable agricultural literature in the language. Originally it performed more near-

ly the functions of a periodical magazine. When agricultural weeklies and monthlies became general, the Journal was made conspicuous for its prize articles on a great variety of subjects, written by men of experience, knowledge, and skill. Later the society has undertaken the employment of scientific and other experts to make exhaustive and costly investigations concerning special branches of the art, and to study agricultural processes at home and abroad. The character of the Journal has thus materially changed, but the change has been in accordance with the requirements of the changing times. It is not too much to say —and it has been my best text-book for many years—that this Journal has no equal, whether as a history of agricultural progress, as a store-house of practical information, or as a record of scientific investigation and discovery in all branches in which the farmer is interested. Its prize essays on stock-raising, draining, dairy-farming (Horsfall), and general farm management are all of the greatest value. Dr. Voelker's papers on farm-yard manure led to a complete change of scientific opinion and practice concerning the best use of this universal fertilizer, and this is only one of many most important contributions to agricultural knowledge made by this distinguished chemist, all of which have first been published by the society. The field experiments of Laws and Gilbert at Rothampstead have always been detailed here, and they are in their way quite unparalleled both in accuracy and in scientific and practical value. There are, of course, many books in the language treating well of all branches of the farmer's art; but the scientific student of agriculture and the practical farmer, supposing him to seek the fullest information, could better dispense with all of them than with the complete set of the Journal of the Royal Agricultural Society of England.



In this connection it is simple justice to refer to the valuable services of Mr. H. M. Jenkins, the secretary of the society and the editor of its Journal. For many years secretary of the Geological Society, he showed such thorough training and such good executive capacity that, although in no sense an agriculturist, he was chosen to his present position by a council with none of whose members he had personal acquaintance. I remember very well the general outcry in the agricultural press over the selection of a mere "office man" and geologist to be the representative "farmer" of Great Britain. He soon showed that special training in any given field may easily be made valuable in another field, and there can now hardly be a member of the society or a reader of the Journal who does not congratulate himself upon the securing of such effective service as Mr. Jenkins has always rendered.

The latest extension of the society's usefulness has been the offering of handsome prizes for the best farms in the county in which the annual show is held, with a report published in the Journal upon the conditions and detailed management of the successful competitors. This has been such an excellent means for disseminating a knowledge of the best agricultural practice of different districts that its adoption by our own societies is greatly to be desired.

ROUSSEAU.

MUSICIANS alone have contributed nothing to the literary monuments of the centenary of the death of Jean Jacques Rousseau. The men of letters, politicians, and philanthropists, even the medical profession (on the side of botany), have paid homage to the genius that produced not only the *Nouvelle Héloïse*, the *Contrat social*, and *Émile*, but the *Devin du Village*, the first opera of which both the words and the music were composed by the same hand. Some one might have reminded the world that Rousseau emerged from obscurity in the *rôle* of a musical reformer, that his first published work was the *Dissertation on Modern Music*, that he never lost his passion for music, and that he depended to the day of his death for his provision against want, not on the proceeds of his literary masterpieces, but on what he could earn by copying music.

The grandson and great-grandson of booksellers might be thought to have come honestly by his literary tastes, in spite of their having been filtered through sixteen children in the generation to which his father, Isaac Rousseau, the watch-maker, belonged. Yet when Jean Jacques says that music was his first and only constant love, and that he "must have been born for the art," he does not need to go so far back to trace the line of heredity. There was his gentle mother, Susanne Bernard, a clergyman's daughter, well educated and accomplished. She could draw, she poetized on occasion, she sang, and accompanied herself upon the lute. What more spiritual endowment from a dying mother to her new-born babe than a sensibility to sounds which we call angelic and celestial, and which truly seem to us at once the intimations and the proof of a higher existence? That which was born in him his good aunt Suson Rousseau, whose life ended in a discord worthy of Zola's dismal transcribing, unconsciously fostered. She sang to him, with a sweet voice, an endless number of airs, which he never forgot, and never recalled without emotion even when the words had wholly escaped him. On this repertory he drew when, having cut adrift

JEAN JACQUES ROUSSEAU.

from Geneva, he set out for Annecy and Madame De Warens, "singing admirably" under the windows of châteaux where he feared to knock, but never catching sight of the damsel who ought, by all the records of romance, to have responded to him. Later still, a vagabond in the streets of Turin, he frequented the royal mass for the sake of the music, which was of the best, for the King of Sardinia's performers had no rivals in Europe. Then he returned to Madame De Warens, to his "mamma," as she allowed him to call her, and with her began his training in music.

This amiable but immoral protector herself sang tolerably, and played the harpsichord a little, and she amused herself by giving lessons to Jean Jacques. She had to begin far back, and he made little progress. He could do nothing under a master. So, practicing by himself out of one of her books the cantatas of Clérambault, he mastered the first recitative and the first air of the *Alphée et Aréthuse*. He was nominally engaged at this time in learning Latin of a seminarist, and as he appeared to every body "not even good for a priest," it was concluded to make a musician of him. For six months, therefore, he lodged with the musical director of the cathedral, and bore his part in the orchestra with a little flageolet; but still he did not get on. Circumstances compelled his master to flee from Annecy with all his musical baggage, and at Madame De Warens's request Jean Jacques accompanied him. In the streets of Lyons the unhappy man falls in an epileptic fit, and Rousseau basely deserts him. "Thank God!" he writes, in his *Confessions*, "I have made this third painful avowal; if there were many more of the same sort to make, I should abandon the task I have begun."

Rousseau was twenty-one years old when, finding himself at Lausanne and out of pocket, he set up as a "singing teacher from Paris;" and feeling a pretender's shame (for he could not so much as read an air at sight), he made an anagram of his name, and called himself Vaussore, so that, having previously changed his religion and his country, there was very little left of his identity. This disguise seemed to increase his audacity, for he not only gave himself out as a composer, but actually composed a concerted piece, which he offered for performance to an amateur, a law professor, M. De Treytorens, who was in the habit of giving private musical entertainments. To the result of a fortnight's original if not honest labor on this piece Rousseau appended, as a minuet, a street air, minus the words, of which he remembered the arrangement, made by a former musical acquaintance. On the eventful evening—but there can be no excuse for not quoting his own description:

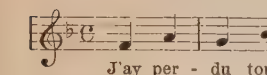
"The performers having assembled, I bustle about, explaining to each the nature of the movement, the manner in which the piece should be executed, the parts to be repeated. They tune their instruments for five or six minutes, which seem to me so many ages. At length, all being ready, with a grand paper roll I give my conductor's stand the two or three taps of *Attention!* Their noise ceases; I gravely begin to beat the measure, and they commence....No, never since the existence of French operas was there ever heard such a charivari; whatever may have been thought of my pretended talent, the effect was worse than any body seemed to expect. The musicians were choking with laughter; the audience stared and would fain have stopped their ears, but there was no help for them. My rascally orchestra, intent on fun-making, rasped away to split the ears of a deaf man. I had the endurance to keep straight on, sweating great drops, it is true, but restrained by shame from giving up and taking to my heels. By way of consolation, I heard those present whisper in each other's ears, or rather in mine: 'This is altogether insufferable!' another, 'What Bedlamite music!' a third, 'What a fiends' Sabbath!' Poor Jean Jacques! little didst thou in that cruel moment anticipate the day when, before the King of France and all his court, thy sounds would excite murmurs of surprise and applause, and when in all the boxes around thee the most lovely women would say to each other, with suppressed voices, 'What charming sounds!' 'What enchanting music!' 'Every one of those songs goes to the heart!'"

But his cup of retribution was not full till the stolen minuet began to be heard, which put the audience in a good humor, and drew forth the most flattering remarks on the great promise shown in it. The mortified conductor, had he declared all, must have confessed himself unable to follow the execution at any point, to judge whether the parts he had himself composed were well or ill played.

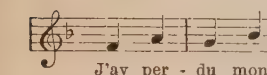
Many experiences and not a few years were to intervene before his court triumph could be realized. At Neufchâtel he had young girls for pupils, and insensibly learned music while teaching it. At Lyons, again, without a roof to shelter him, a cantata of Batistin's, which he sang on the way to his last breakfast, saved him from want by procuring him the job of copying it for an amateur. But this was so ill done that the music could not be executed; and that copying should eventually become Rousseau's chosen means of subsistence was only another of the contradictions in which his life abounded. Resuming his relations with "mamma" at Chambéry, he gave himself up passionately to music, devoured his contemporary Rameau's *Treatise on Harmony*, learned the cantatas of Bernier and Clérambault, led the monthly concerts at Madame De Warens's, and at last, abandoning the engineer service in which a place had been made for him by patronage, and disregarding the proverb with which "mamma" admonished him that

> "Qui bien chante et bien danse,
> Fait un métier qui peu avance,"

resumed the teaching of music. The change was prudent as regards the pecuniary result, and delightful for the society into which it brought him—the charming daughters of the nobility of the neighborhood: he names them over at sixty with lively appreciation and a tender regret. He composed pieces which were capable of giving pleasure to connoisseurs when performed. Another mark of progress was his ability to note down music as sung to him; and from this to the invention, in the true Yankee spirit, of an improved method of notation was but a step. It was with such a system in his pocket that, leaving Charmettes and his unworthy "mamma," he set out trustfully for Paris to make his fortune, in the fall of 1741.



He began by giving lessons in composition, and it was not till August 22, 1742, that, through the friendly intervention of Réaumur, he was presented to the Academy of Sciences, and permitted to read his essay on notation. Referred in due course to a committee, it was reported to be neither new nor useful, and Rousseau admits at least one objection to it (of Rameau's), pertaining to instrumental execution, to have been well founded. Nevertheless, he recast his essay, expanding it and giving it a more popular treatment, and in 1743 appeared with it in print for the first time. The *Dissertation sur la Musique moderne* is a remarkable proof of the mental development which less than ten years had wrought since the Lausanne fiasco. More proofs were in store. Stimulated by hearing a feeble opera of Royer's, he began one for himself while ill of a fever, but it slipped from him, and on his recovery he devised the words and music of the *Muses galantes*, showing in three characteristic acts the strong love of Tasso, the tender passion of Ovid, and the jolly amours of Anacreon. Tasso he had worked a whole night over when he was suddenly called away to join the Comte de



Montaign, French ambassador to Venice, as his secretary of legation.

At this critical period of his musical growth a residence in Italy was decisive of his choice between the French and Italian schools of music. Happily cut short in his diplomatic career, he left the land of the barcarole for Paris, resumed the *Muses galantes*, and finished it in three months, and, under Rameau's somewhat jealous direction, it was performed in part at M. De la Poplinière's, and finally at M. De Bonneval's, in grand style, at the king's expense, M. De Bonneval being the *intendant des menus*, or director of the court's festivities. Before it was presented to the king, Rousseau was advised by the Duc de Richelieu to compose a substitute for Tasso, which he did, taking Hesiod for his theme—"Hesiod inspired by a Muse." Meantime, for the fêtes at Versailles which followed the battle of Fontenoy (May 11, 1745), the same duke imposed upon Jean Jacques a task which implied a double compliment of the highest order. Rameau had set to music a drama of Voltaire's called *The Princess of Navarre*, which seemed available for the new occasion, with some alteration as well in the libretto as in the score. Both the eminent authors were passed over in favor of the young aspirant, and Voltaire very graciously acceded to Rousseau's very modest request for permission to change his verses. This was the first intercourse between the two geniuses who divide the honor of being precursors of the French Revolution, and who were afterward to detest each other so heartily. It was marked by the homage for Voltaire's intellect which Rousseau never ceased to express, in spite of all the detraction and abuse which the philosopher of Ferney subsequently heaped upon him. Two months were sufficient for the necessary reconstruction of the piece, to which were added an overture in the Italian style and a recitative. They were received approvingly by the public; but Rameau avenged himself by attaching only Voltaire's name to the opera, content to be eclipsed himself if Rousseau were thus kept in the background. Lack of mention the latter might have forgiven, but he could ill afford to receive no pay for his labor. Such treatment from nobles and princes was, however, not surprising. From his friend Diderot something better was to have been expected. He begged Rousseau to prepare the article on music for the Encyclopedia, and the work was punctually executed; but the promised remuneration never came, and Rousseau was even at the cost of copying off the article.

Extraordinary as seems the advance which Rousseau had made toward fame and the patronage of the great, he was still undiscovered, if we may say so, when in 1750 he was impelled to compete for the prize offered by the Academy of Dijon for the best essay on the question, "Whether the progress of the arts and sciences has helped to corrupt or purify manners." His success while advocating the pessimistic view at once gave him a notoriety far transcending the limits of Paris or of France. From that moment nothing that he did or wrote could be hid from the gaze of mankind. Yet it was just at this time that he forsook his dependence upon the rich and powerful, and began to copy music for a livelihood, and that he marked the change by reforming his dress, which had before been elegant, for when his mistress's precious brother made away with his Venice wardrobe he had to put up with the loss of forty-two fine shirts. To avoid the impertinent approaches of the curious, he used to visit at Passy a well-to-do relative named Mussard, a retired jeweller, who united the ardent pursuit of conchology to an equally ardent passion for Italian music, which found vent in performances on the 'cello. One night (the year is 1752) before retiring they talked of the opéra bouffe they had enjoyed in Italy, and with his brain full of the subject Rousseau went to bed and began to imagine how he might give the French a new idea. In the morning he was still absorbed by the same thought, and while out walking (his mind being ever fresh when he was on his legs) he composed the words and the music of parts of the *Devin du Village*, as the opera was presently to be known. Mussard was so emphatic in his approval that Rousseau persevered in his undertaking. In six days the libretto was finished; in three weeks the music was complete, except the *divertissement*, which was subsequently added. Through his friend M. Duclos it was submitted anonymously to the Opéra, and the rehearsal so recommended it that the court intendant, M. De Cury, demanded it for first representation at Fontainebleau. There was a struggle to keep it for Paris; but the court won, and Rousseau was admitted to the rehearsal and to the first performance. He made a virtue of attending the latter in his every-day garb, slovenly but not unclean, his face unshaven, his peruke frowzy. He was placed in a box where he was surrounded by ladies, and confronted by the king and Madame De Pompadour, the royal family, and all the extravagant attire of the court. An uncomfortable sense of being out of place gave way to self-justification even as regarded his beard. The curtain lifted, and the play began. The poor acting was atoned for by the excellence of the vocal and instrumental parts. At once murmurs of surprise and applause arose, and the fair ladies about him indulged in those exclamations which by their very contrast recalled, and for a moment painfully, the concert at M. De Treytorens's. At the first duet the house—the most *blasé* in

Europe—was in tears; and Rousseau, whose flood-gates were easily opened, joined in the general emotion. The effect on the king was such that, as one of his courtiers reported, he went about the next day singing, with the falsest voice in his kingdom:

and he desired that the composer should be presented to him, with a hint of a pension. This avenue to the royal favor was closed by Rousseau's absenting himself from the appointment.

The *Devin* was played at Paris during the Carnival of 1753, with the newly composed overture and *divertissement*, and it finally became the property of the Opéra, where it was represented nearly four hundred times, until 1829, the date of its last performance. On the 10th of November, 1765, the author, then on his way to England (so little was he a soothsayer in his own case), heard it at Strasbourg, when the crowd was so great that more were admitted than could be seated, and the applause enthusiastic. Jean Jacques occupied a box with a grating, which he had paid for, refusing the freedom of the theatre. While he was in England, in 1766, the *Devin* was brought out at Drury Lane, and on his final return to Paris it was still a favorite attraction to opera-goers. Pecuniarily it was the most profitable of all his productions, netting him 5300 francs, of which the king contributed 2400 and Madame De Pompadour 1200. With it his fame as a composer reached its climax; but his musical career was far from being ended. In the very flush of his triumph, and still in 1753, an incident occurred which at once raised against him an outcry as vehement as if applause had been unknown to him. Some Italian bouffe artists were playing at the French Opéra in conjunction with French performances. The contrast was extreme, and only the *Devin* stood the test. Thereupon arose two parties in Paris—pro and anti-Italian—the grandees opposing, the connoisseurs defending, the school. From their rallying-places at the Opéra, they were called respectively *Coin du Roi* (the king's corner) and *Coin de la Reine* (the queen's corner). Rousseau of course enlisted among the Italians, and his contribution to the mêlée was the famous "Letter on French Music." The effect produced by it may be judged from its motto, "Sunt verba et voces, prætereaque nihil." The opening sentence was audacious enough:

"Do you remember, monsieur, the story of the child of whom M. De Fontenelle tells, who was born in Silesia with a gold tooth? All the doctors in Germany first exhausted themselves in learned dissertations to explain how one could be born with a gold tooth; the last thing they thought of was to verify the fact, when they found that the tooth was not gold. To avoid a like awkwardness, before discussing the excellence of our music it might be well to make sure of its existence, and to inquire first, not if it is golden, but if we have such a thing."

The conclusion of the letter was crushing:

"I think I have made it clear that there is in French music neither measure nor melody, because the language is not susceptible of these; that French singing is nothing but a continual barking, intolerable to any unprejudiced ear; that its harmony is crude and expressionless, suggestive only of a tyro's embellishments (*remplissage d'écolier*); that the French recitative is no recitative. Whence I conclude that the French have no music, and can have none, or that, if they ever do, it will be so much the worse for them."

The fermentation caused by this affront to the national vanity was tremendous. In the hubbub a violent contest between the clergy and the parliament of Paris, which had just ended in the customary banishment of the latter, and threatened to lead to a speedy outbreak, was allayed by being fairly drowned out. For Rousseau there was talk of the Bastille, of a *lettre de cachet*, of exile. His free pass at the Opéra, the original price of his *Devin*, was taken away. His most intimate friends fell off, some from passion, some from jealousy, and the graver misfortunes of his life had here their beginning. His greatest successes, also; for he was in self-defense drawn back from music to literature, and in his retreat at the Hermitage the *Nouvelle Héloïse*, the *Émile*, the *Contrat social*, all had their origin. At the same place, too, was begun his *Dictionary of Music*, an outgrowth of his articles in the Encyclopedia, which held its own as an authority down to the second quarter of the present century, and may still be consulted with profit by the student of music.

The countless refutations of Rousseau's "Letter on French Music" left his arguments unanswered, and time has, on the whole, approved the justice of them. There have been French composers, as there have been French poets, since his day, but it can not be said that there is a French school of music, or that the language is fit for singing any more than it is for poetry. The defect is fundamental. Rousseau's own attempt in the *Devin* to overcome the difficulty was meritorious, but the popular sanction of it did not hinder him from laying himself open to the charge of inconsistency by writing the "Letter on French Music." His unfriendly judgment of German music would doubtless have been modified had he survived the development under Mozart and Beethoven. He enjoyed the friendship of Gluck, and admired his compositions in spite of the French libretto; and Gluck, in his turn, had so much respect for Rousseau's criticism that he importuned him for it in the case of his *Alceste* when he was on the point of adapt-

ing it from an Italian to a French text. The request was complied with very reluctantly, and the result never went beyond some fragmentary observations on a part of the opera, but they sufficiently confirm Gluck's confidence in him as a friend and as a critic. Gluck first had dared to break away from the established models of Italian opera, and to assert for the dramatic element of composition a place beside the lyrical. To his revolutionary experiments we owe in a large degree the musical attainment of the present century. But if he was the forerunner of the Music of the Future, some honor as a pioneer belongs also to Jean Jacques, who with not less courage attacked French traditions, and with more versatility combined the functions of poet-dramatist and composer. In this latter respect he is more nearly than Gluck the prototype of Wagner, and perhaps also as a polemic.

Some attempt to measure the breadth and depth of Rousseau's musical gift and his permanent influence on the art is what might have been expected in the centennial year just passed. His sensibility to melodious sound is attested in a thousand ways. The man who could walk two leagues daily during a whole spring-time to hear a nightingale was justified in adopting a lyre for his seal, and in proclaiming himself "born for music." His creative powers were repressed by the unhappy circumstances of his life, and perhaps can not be rightly judged by a generation unmindful of the *Devin du Village* or the *Muses galantes*. His *Dictionary* and all his utterances on music are worthy of the intellect which produced *Émile* and the *Nouvelle Héloïse*, and perhaps posterity's verdict will be substantially that of a recent Italian critic, who styled him *intelligentissimo di musica*.

Rousseau's minor compositions were numerous enough, for when not spontaneously engaged upon a theme he was always liable to have one offered him by a friend, and he was seldom disobliging. The fullest and finest collection ever published was the posthumous one made in 1781 by M. Benoist, which bears the title, *Les Consolations des Misères de ma Vie; ou, Recueil d'Airs, Romances, et Duos par J. J. Rousseau.* It contains ninety-five pieces, beautifully engraved, and is adorned with a pictorial title-page in aqua fortis, among the accessory ornaments of which one remarks the "Letter on French Music" honored equally with the *Dictionary* and the *Devin*. The list of subscribers, representing the pink of the nobility, is headed by the new queen, Marie Antoinette. Of these old-fashioned airs a single specimen must suffice (No. 34, p. 62). It is the third arrangement made upon the noble stanzas of Desportes, "O bien heureux," etc., of which the sentiment was so perfectly in accord with Rousseau's spirit, and so little complimentary to the noble patrons of the *Recueil:*

THE NECKLACE.

She made for me a string of cockle-shells,
Yellow and white and red and dusky brown,
As beautiful as any garden bells,
With lustre all their own.

She gathered them upon an island coast,
In mist and cold, upon the lonely shore,
And those selected from the shining host
That loveliest colors wore.

Then with a golden cord she made a chain,
Whereon she slipped the shells, and laid them here
About my throat, and watched the rippling stain
Circle and reappear.

I heard the jewelled ladies, gazing, say,
"They are but common cockle-shells we find
Down by the sands whereon young lovers play,
And weedy garlands bind."

While little sunburnt children, seeing them
Around my throat, clasp me with tender hands,
As butterflies cling to a thistle-stem
Upon the arid lands.

They know how often from the slimy weed
These shells have glistened to their eager eyes,
And our love grows, as from mould-planted seed
The blue-eyed flowers arise.

And happy in this joy of common things,
Trustful they watch the building of the birds,
And peaceful learn to hear their flitting wings,
And folding of the herds.

And when, by night, I hold my chain, I muse
What wonder this my friend hath wrought for me:
Here dawns and sunsets keep their mingled hues,
And visions of the sea;

With gleams of common love that strangely come,
Lighting our souls along this darksome earth,
Making whatever else may seem life's sum
A thing of little worth.

Robert Herrick.

CRIBBAGE.

HOME.

"Home is home, be it ever so homely."

IT was in the spring of 1866, while I was still in the public service, and stationed in a Southern city. Society was extinct, official duties merely nominal, and wife and I tried to while away the weary evenings with the old-fashioned game of cribbage. But it is a dull business for husband and wife to play antagonistically at cards (or at any other game), for when by shrewd calculation one makes a long sequence at play, or by good luck is enabled to show a full hand of sevens and eights, a glance at the vexed countenance of his *vis-à-vis* is always sufficient to quench his exultation, and he feels a sort of guilty humiliation in accepting the advantage accorded by blind fortune over the gentle being whom he has solemnly vowed to love, cherish, and protect. On the other hand, no one who piques himself ever so modestly on his skill and manhood enjoys being beaten continually, to say nothing of the impolicy of allowing his life partner to acquire a habit of supremacy even in matters apparently so innocent and insignificant as parlor games.

So when the clock struck eleven we dropped our cards, hustled the counters into the box without deigning to note the score, and thrust the box into the stand drawer with a listless precipitancy, as if we were glad the evening's amusement was over.

My position afforded at least a pretense of present occupation, and a chance, however vague and uncertain, of a future career. Madame had no direct interest in anything except myself, a flea-bitten poodle, and a spindling geranium that adorned the window of our lodging-room. With such feeble adjutancy it required more than masculine conceit to imagine that one could absorb the whole existence of a young, large-hearted, well-trained, and capable woman. If I had been weak enough to indulge in any such conceit, a glance at my partner's countenance would have dispelled the illusion. She sat a picture of magnanimous meekness, a statuesque monument of dutiful martyrdom. Her compressed lips indicated a silent damming (this is an unhappy expression; we should say, rather, an uncomplaining suppression) of natural longings and instincts. It was evident there was something lacking in her life which neither official dignity, nor cribbage, nor floral decoration, nor an animated poodle could fully supply.

Now I was by no means wedded to the public service, for "the big wars that made ambition virtue" were ended, and party spite, self-seeking, intrigue, and calumny, which made all virtue seem despicable or impracticable, had resumed their sway, as when a thunder-storm, with its awe-inspiring sublimity, has passed away, the frightened frogs again venture out from their slimy puddles to vex Peace with their windy croakings.

Amid the disgusting din I had already concluded that "le jeu ne vaudrait pas la chandelle," and was rather anxious for an apology to throw up my hand, box my counters, and quit. I thought I could guess what was the matter, and shrewdly surmised that the same unspoken and unacknowledged yearning had troubled both our hearts for months past, but etiquette requires that the lady shall speak first; and she didn't, and she wouldn't. Perhaps she would have died first, and perhaps it may have been the dread of such a catastrophe which finally induced me to waive ceremony and compromise masculine dignity so far as to invite an advance on her part—in military parlance, to make a demonstration so as to draw her fire and develop her position.

"All ancient literature and tradition recognize the dignity of fixedness, while the nomad has ever been an object of contempt, distrust, and pity. Soliman asks, 'Who will trust a man who has no house, and who skippeth from city to city?' If he stops at a tavern, the suspicious landlord demands

his bill in advance; if he asks private hospitality, he is called a tramp, and delivered over to the police. The exiled poet of Etruria has immortalized 'the weariness of other people's stairs, and the bitterness of a stranger's salt.' How much of the demoralization of American life is directly attributable to the restlessness engendered by cheap lands and cheaper honors, aggravated by unlimited facilities of locomotion and perennial elections!"

Up to this point my "white-armed Juno" had hearkened in silence. Now, with flushed cheek and kindling eye, she turned and questioned me: "And where, then, are we to look for all the virtues of our boasted republic—the unselfish patriotism, the pure morality, the cheerful industry, and proud independence—which I have heard you descant upon so often and so eloquently?"

I felt confused and cornered, for now I must either acknowledge that I didn't know, and confess the emptiness of my democratic rhetoric, or I must take the lead on a subject which I had hoped by skillful play to throw into my partner's hands. But pride of consistency and of country prevailed, and I frankly answered: "Where else would you look for it but in our American home life—in those homes where the door-plates are not changed every May-day, and where the children learn to climb the trees which their fathers have planted. A homeless man makes but a sorry citizen at best, yet in turbulent times your adventurous carpet-bagger may attain both wealth and honors. But woman, the nucleus of all social organization, the incentive of all man's noblest thoughts and enterprises, the conservator of all that is most worthy in our civilization—what is she without a home?"

A gleam of triumphant joy lit up the face of my questioner. Then she abruptly turned away and was silent, and I thought I saw a tear upon her cheek.

"Well," I continued, "since you confess you are pining for a home—"

"I confessed nothing of the sort," she replied, briskly. "It was you who introduced the subject."

I answered that I was merely generalizing—talking philosophy, you know.

"You've been talking at and around it for the last three months, trying to induce me to propose it; but I had made up my mind that I wouldn't say a word, and I didn't. But now that you have proposed it yourself, I say, yes, with all my heart. Oh, husband, do let us have a home of our own!"

It was settled, and we were both so happy in the prospect that the little pique involved in the introduction was soon forgotten in the delicious emotions of planning.

"Shall I resign to-morrow, or wait until the end of the month? Let me see, that will be next Saturday a week."

"Oh, do not wait!" exclaimed the lady, eagerly. "Let it be to-morrow, and early, before evil counsellors or selfish second thoughts can come to thwart our plans. I can pack the trunks in an hour."

"Patience, dear wife; there must be some method in our madness. A pair of simple wrens, whose occupancy lasts but for a little season, will reconnoitre and chatter for a week or more ere they venture to locate a nest; the requirements of our more enduring and complicated humanity certainly deserve as much consideration. In abandoning our present position we shall be literally houseless and homeless,

> 'With the world all before us, where to choose
> Our place of rest, and Providence our guide.'

In this faithless age we hold that Providence takes care of those only who help themselves. Let us endeavor, then, to ascertain which way the wind blows before we lift our anchor, and look a while at the chart ere we put to sea. In the first place, would you prefer a home in the city or country?"

My dame replied, considerately: "A city residence has many advantages, but the home of my dreams has always had a garden and a woodland."

"There is one point settled. We will live in the country; it costs less, and one gets more for his money. Next, to what point of the compass shall we direct our reconnoitring glasses? How would you like the North?"

"It is too cold in winter, and the people are too busy to enjoy life."

"And the South?"

"Is too feverish and Southern."

"Then there is the boundless West open to us, with climate to order; no local narrowness; no antiquated opinion; no ancestral dignity to weight one down like the Old Man of the Sea; no rats nor haunted chambers—all fresh and free and hopeful as youth—"

"Neither is there any settled society; no ancestral trees; none of those mingled sweet and sad traditions that make home sacred. Their towns are encampments, their villages picket posts, their cottages sentry-boxes of the Grand Army of Civilization. There can be no homes there until the conquest is complete."

"Then we shall find a suitable resting-place, I am sure, among the ancient settlements of the Eastern sea-board, where long attrition has polished the manners, and time mellowed the crudeness of individual opinion; where the growth of quiet centuries overshadows the old gambrel-roofed, dormer-windowed dwellings; where green and flower-decked slopes and hazy landscapes have not been scarred nor marred by railroad cuts or factory chimneys; where sober-paced habit in business or pleasure remains

unstartled by rumbling trains or steam-whistles; where those venerable bull's-eye watches which our great-grandfathers brought from England still endeavor to keep time on tick, and with uplifted hands protest against the centralizing tyranny of the sun; where the newspaper enters but once a week, the telegraph is unknown, and honor is spelled with a *u*."

"Alas!" sighed my lady, "your sketch is too suggestive of stagnation and decadence; you would care to see it again. I did not suppose your brief sojourn there had inspired any local attachment, and, as I understand, the old place is a wreck and ruin—most likely not inhabitable; and as for society, it is extinct, or worse."

Madame leaned her flushed cheek upon her hand and spoke, thoughtfully: "I would rather make my home there than in any place I have ever seen; and if you are not averse, I should be content to keep house

OLD-TIME CONVENIENCES—CARRYING IN DINNER.

ancestral pride vainly struggling with poverty; dilapidated, rat-infested tenements, ill built and ill contrived originally, and not adaptable to modern improvements and conveniences."

So eager had she been to move that I was a little surprised and disappointed to find my companion so critical; and having boxed the geographical compass, I waited in silence for a suggestion from her, inly suspecting the while the existence of some concealed magnet which fixed her fancy, and turned its repellent point toward every thing else.

After some hesitation she asked: "Why have you not suggested our going back to the old place?"

"In that war-wasted region every thing is so sadly changed that I hardly imagined in a shed by the ruined walls until we can have every thing repaired and refitted. As for society, the richest grapes are those which spring from volcanic ashes."

"At any rate, we can go and see."

And so we packed, made our formal bow, and departed.

The old place referred to was not an ancestral home endeared by habit and family traditions, nor was it a dapper modern cottage, convenient, sanitary, and picturesque. It was only a plain, old-fashioned, square brick house on the outskirts of a quiet village in the Virginia mountains. Five years before, wife and I had set up housekeeping, and passed our brief honey-moon there. Our planning and planting had been interrupted by the storms of revolution, and now

after five years' exile we were returning, animated with the fond hope of recommencing just where we had left off.

It was a poetic May day when we left the railway station, and with our two weather-beaten trunks mounted the open spring wagon which was to convey us to our destination, six miles distant. Our route was up a narrow valley hemmed in by wooded hills, drained by a brook which meandered through what had formerly been open meadows and cultivated fields, enlivened here and there with the white-washed cottage and log out-buildings of a mountain farm. Now the roadway, overgrown with grass and weeds, was nearly obliterated; all traces of fences and inclosures had disappeared, and the site of the farm-houses was indicated by a ruined chimney standing like a monument amidst charred logs, straggling lilac bushes, and neglected fruit trees. Savage nature had hastened to repossess herself of the undefended fields and meadows, which were thicketed with a growth of young pines and blackberry and sumac bushes. At frequent intervals we marked by the roadside the mouldering wreck of some vehicle, and the whitening skeletons of horses. Except an occasional dreamy buzzard floating high in air, a gray rabbit darting across our track, or the whir of a partridge startled from the thicket, the desolate valley was lifeless and silent. It seemed as if in a few more years all traces of man's conquest would have disappeared, and wild nature would again have reigned supreme. But the labors of our mountain settler are strictly utilitarian; he is instinctively unfriendly to the æsthetic; and I thought I had never seen our valley looking so beautiful. At the village it was quite different. The works of man have no innate powers of reconstruction. Here wasting time, neglect, and violence had left their grimy finger-prints on every thing. The weed-grown streets were silent and deserted. No tidy dames nor merry children thronged the doors as of yore to greet the passing traveller with open-mouthed and cheerful curiosity. When here and there we did catch a glimpse of a care-worn face peering suspiciously through a broken window or dilapidated doorway, it was hastily eclipsed before we could assure ourselves of recognition. This was not an auspicious approach to the goal of our hopes, which stood at the farther end of the village.

THE DRIVER.

AN AMERICAN RUIN.

Suddenly madame grasped my arm with an exclamation of delight. Home at last! We stopped directly in front of the well-remembered dwelling. It was high noon when the driver landed us and our baggage on the green, took his fee, and departed.

We stood alone and in silence until the emotions of the moment had subsided, then proceeded methodically to reconnoitre the prem-

ises. The brick walls were dingy and weather-stained. They had been pierced with loop-holes for musketry, and here and there scarred by bullets, but they stood solidly and substantially uninjured. The shingles had sprung and curled until the roof resembled a frizzled hen. The bare rafters showed through a long rip caused by a glancing cannon-shot, and near one of the chimneys was a large opening whose charred edges indicated the work of fire. The shattered panes and entire absence of sashes in many of the upper windows indicated that the house was tenantless. The wooden portico at the entrance had parted from the wall and fallen prone, lumbering the approach with its wreck. The whole ground was inclosed with a rude hybrid fence, made up of remnants of the old palings, eked out with rough boards, pine logs, and worm-fence rails dragged from the neighboring fields. There was no gate, but we easily climbed the fence, and made our way to the front-door. This was stained, battered, and defaced with rude carvings and scribblings, but there was neither latch nor knob visible, and it was firmly closed. Stepping back, I gave the barrier a heavy blow with my boot-heel, when it fell inward with a loud bang, which reverberated through the house. At the same instant a black cat, with green glaring eyes, fled with a spit and a yowl, escaping through one of the broken windows.

But to us this had never been the abode of fear, so we eagerly entered the stormed fortress. We found no other enemies there than silence, emptiness, and dirt, but enough of the latter to have appalled feebler natures than ours. My companion's courage was of a quality which rose to meet the direst emergencies. As she surveyed the interior she gave vent to her feelings with a vehement whistle—which in a woman I take to be an equivalent for swearing in a man.

"Good gracious, husband, what a pig-sty! Why, it will require a month's hard scrubbing to make it habitable."

And no wonder. It had been alternately a rendezvous for Union Leaguers and rebel raiders, picket post, guard-house, cavalry barrack, and block-house, having changed hands between the contending factions at least fifty times during those four lawless years. From ceiling to wash-board its once white walls were scratched and scribbled over with the records of its diversified occupancy—names which figured on regimental rolls from all the States from Maine to Texas, with scraps of soldier wit in prose, verse, and pictorial illustration, exhibiting all the varieties of opinion engendered by local prejudice and political exasperation, and couched in a phraseology which would have done honor to the "army in Flanders."

However, the ceilings indicated no serious leakage, and the floors were sound, except in front of the hearths in the lower rooms, where the planks had been burned through until the mouldy depths of the cellar appeared between the charred sleepers; but up stairs we found a room which we concluded might be made presently habitable, and next proceeded to inspect the back building—kitchen and accessories.

The back-door had a lock, but the hasp yielded to the first pull. As I stepped out on the porch I suddenly struck a vicious blow with my cane, and with an exclamation of disgust sprung back into the doorway, nearly upsetting my companion, who was just coming out. A large copper-head snake, which had been sunning himself on the planks, wriggled over into the grass with a broken back, where I soon dispatched him.

At this point a voice inquired, somewhat authoritatively, "Who dat da, fussin' round da now?" Looking up, I saw an old negro man standing by the open well with a tin bucket in his hand. I advanced and demanded with equal gruffness who he was and what he was doing there. As I spoke our fellow-citizen of color dropped his bucket, and hastening forward, seized my extended hand in both his.

"Why, master, I's mighty glad to see you back safe and sound, I is dat. Dis country ben mighty lonesome sence soldiers went away. Now things begin to look up agin sence folks comin' back."

I responded cordially and sincerely to my old freedman's greeting, for his opportune appearance solved a difficulty which had been worrying me since our arrival. "Uncle George," said I, "is your family with you now?"

"Yes, Sir; my wife and a grown daughter;" and he pointed to his cottage at the edge of a wood not more than a hundred yards distant.

"Go at once and bring them here, with a tub, a broom, and a floor-cloth."

George soon returned with his re-enforcements, who went to work with such zeal that in an hour the room was fairly swept and washed, the trunks carried up, and a brisk fire sparkling in the chimney to dry off the dampness.

I then dispatched my zealous assistant with a written order to a friendly neighbor, at whose house a part of our furniture had been stored for safe-keeping, and in an hour more our chamber was modestly but habitably furnished.

By this time the sun was declining, so we dismissed our assistants with a gratuity, and orders to return at eight next morning. Then we opened our respective trunks, and wife spread a clean napkin upon our bit of a table, while I displayed my camp equipage

of tin plates, cups, spoons, knives, and forks for two. Then madame rejoined by excavating from her travelling basket a store of crisp biscuits, potted ham, Stilton cheese, and sugar cakes, then a glass jar containing ground coffee, and a small tea-caddy. We decided on tea for the evening beverage, so the little coffee-pot was set aside, and we brewed our drink in a tall porcelain cup. The meal was excellent, and any deficiency in style was more than supplied by the exhilarating consciousness that we were at home—for the first time in five years.

When it got dark madame produced a pair of wax candles, which were lighted, and accommodated in the sockets of a brace of rusty bayonets which we found sticking ready in either end of the wooden mantel-piece. The lighting developed another lack in our establishment, which was speedily supplied by tacking up several superfluous night-gowns and calico dresses to serve as curtains to the windows. Then we sat down, looked around our ménage, repeating the word HOME a dozen times over, and laughing in each other's faces from pure lightness of heart. Our hilarity reverberated through the vacant house with a strange, hollow sound, and we stopped to listen.

ASSAULT AND BATTERY.

"I hear persons whispering there in the passage," said my companion, edging her chair closer to mine. Indeed, it seems as if they were in the room with us. There was no door whatever to our chamber, and the doors below were only fastened by a prop and a stone, while the windows were quite open. So I took my revolver in one hand and a candle in the other to explore the dark passage. Ere I had left the room the candle I carried was extinguished with a sudden puff. Wife gave a little shriek. I started back and presented my cocked pistol. Then a bat flopped in my face and fell to the floor.

"Pshaw!" I exclaimed; "what nonsense! I might have known it. Why, the room is full of them." So I relighted the candle, put up my weapon, and we had another laugh over the adventure.

At length it was bed-time, and the fatigues and excitements of the day had made the hour cordially welcome. I am a good sleeper, and did not tarry long by the way. Some time in the night I was roused by a shake and an anxious inquiry from my partner: "Husband, what dreadful noise was that?" I didn't know, and suggested she had had the nightmare, or perhaps had heard me snoring. She indignantly rejected the explanation. The noise was something frightful, fiendish, unlike any thing she had ever heard before. "There! there! don't you hear it?"

"Oh, that is nothing but a complimentary serenade offered by the natives—a nocturne from *Der Freischütz* vocalized by a pair of screech-owls in the garret;" and before the song was ended I was off again. My coolness was rather insulting, but madame got her revenge, for before morning I was jolted from my dreams by a crash which made the house tremble. Sitting bolt-upright in bed, I stared wildly around.

"But hark!—that heavy sound breaks in once more,
As if the clouds its echo would repeat;
And nearer, clearer, deadlier than before:
Arm! arm! it is—it is the cannon's opening roar."

Then my placid spouse asked a very simple and obvious question: "Husband, do you think the roof leaks any where over this room?"

I collapsed with a response which was indirect but patriotic: "O my country! how sweet and beneficent is peace!" and the next hour passed in the most blissful consciousness of rest and security under our own roof-tree. Our mountain thunder-storm howled through the forests and reverberated from cloud to cliff, the rain fell in torrents on the roof and splashed by pailfuls through the broken windows; but to me it sounded like the voice of an old and familiar friend—a boisterous but cheery welcome home.

Morning dawned all bright and dripping, and our reveille was the song of Cock Robin, who, with his mate, was building a nest near our window. I rose and kindled a fire, which in a pine-knot country is a pleasure rather than a task. Madame followed, and set about brewing the coffee. Old George, who was on hand betimes, had brought eggs, butter, and milk, besides a bag of white Mercer potatoes. A considerate neighbor had also sent a basket of rolls, light and hot. With these resources we breakfasted triumphantly, and had no fears for dinner.

NEIGHBORLY.

Now rested and refreshed, we went down to view our out-doors estate in the morning sunshine. Madame was delighted to find some of her roses and hardy shrubbery still surviving the years of waste and neglect. For the rest, the yard and garden were a wilderness of weeds and suckers, in the midst of which a dozen or more fruit trees and several shade trees still reared their thrifty heads. As we explored the almost obliterated walks we started several rabbits and a pair of quails, and later in the day I shot a red fox that was trotting leisurely across the upper end of the inclosure. We watched nervously for the mate of the snake I had killed, and finally dispatched three young ones, which indicated that they had a family under the porch floor.

After having thus briefly studied the topography of our own domain, we walked about the village and visited some old acquaintances, from whom we gathered sundry interesting items of local history, and such knowledge of the present resources and condition of our region as was needed to carry out our project of re-establishment. The prospect was not altogether encouraging, as our people had not yet resumed the sober habits and industries of peace.

Those of the victorious party were still too arrogant with unexpended bounty money and expectations of public office to undertake manual labor; while the defeated, meek with poverty and suffering, were glad enough to get any job that offered, but for the most part were so unskilled in the arts of reconstruction as to be of little avail.

There were, however, two works of primary importance, and which admitted of no delay. With a good waterproof roof over us, we could improve our interior at leisure; with a substantial and prohibitory fence around our lot, we could replant the garden in tranquil security. With a little diplomacy and extra expense we accomplished them both.

Now commenced the most engaging and beguiling of all domestic occupations—the planning. As the season was advancing, we worked on house and garden concurrently, spending the pleasant mornings in the open air, surveying, staking, planting, and directing. In the evenings and on rainy days the table was spread with drawing implements and Downing's *Cottage Architecture;* and here we read, discussed, sketched, measured and remeasured, ciphered and estimated. This latter operation was the touch-stone which reduced most of our paper castles to ashes. But this only prolonged and even enhanced the enjoyment of solving a puzzle which requires the exercise of so many different faculties—mathematical, mechanical, domestic, social, sanitary, æsthetic, and, above all, financial. Unfortunately—or fortunately—our house was built before all the modern sciences had concentrated their light on domestic architecture, and thus divers important and per-

plexing questions had been settled beyond discussion. There was no arrangement for ventilation except the ill-fitting doors and windows, and no heating apparatus but the ample open fireplaces. Satisfactory drainage had been insured by the natural slope of the ground, while the sun in his diurnal course warmed all the walls and shone for several hours in all the windows, because the square house sat with its four corners directly toward the four cardinal points of the compass.

We hasten to exonerate our ancestral builders from any suspicion of design in this happy location; it was simply a topographical necessity imposed by the trend of the narrow valley and conformity with the village street, as doubtless the sincere solidity of the walls and awkward strength of the timbers were also attributable to their ignorance of that superior craft which teaches our modern artificer to put up a "shoddy job" at once more showy and more costly.

THE NEW ERA.

But we were rather attached to the old *régime*, and did not propose to disturb the antiquated simplicity of our dwelling further than might be required to adapt it somewhat to the new era in domestic service. To this end there was to be a re-adjustment of spaces, a repartitioning of rooms, and a corresponding change of windows into doors and doors into windows. The public stairway (which is a tradition of palatial and manorial architecture quite out of place in the simple home of a democratic citizen) was to be dislocated and made private.

For the rest, we had seen so many sturdy boys and rosy girls nurtured in houses which violated all the sanitary rules at once, and had enjoyed so much cheerful hospitality and substantial comfort in the most inconvenient habitations ever contrived by ignorance assisted by a perverse ingenuity, that our reformatory zeal was as often checked by sentimental doubts as it was by financial prudence.

My superior technology and facile pencil had thus far secured me an easy advantage in all our discussions. Indeed, madame had continued to yield her positions with such flattering facility that I began to suspect she was drawing me into some ambuscade.

Her masked batteries were developed when the finished plans were at length triumphantly exhibited for her inspection and approval. She viewed them coldly, and with a curl of the lip that was almost scornful. She had no doubt they were very cleverly drawn, and all according to rule. She knew very little about architectural details, but as far as she understood them, she could see no provision for closets and bow-windows.

There it was at last. There was to be a battle. I detested closets, and bow-windows were ruinously expensive. She wanted two closets and at least one bow-window in every room in the house. I hoped these extravagant demands were only intended to elicit favorable offers of compromise, so I erased a rustic porch on the southwest face of the building, overlooking the croquet ground and sundry pictured beds of flowers. "Here," said I, "is one bow-window, a fine roomy one, big enough to take tea in, with a charming outlook."

My prompt compliance was rewarded with an encouraging smile and a coaxing query. "Now couldn't you put one here to the parlor—here, just opposite?"

"I could very readily with my pencil, but our bank account, I fear—"

INCONVENIENT POCKETS.

She interrupted me with an acquiescent, "Very well; we will try and be happy with one, especially as it is to be such a big one."

"And now for the closets. What on earth do you want with all these closets?"

She replied with a curt counter-thrust: "What do you want with so many pockets in your coats and breeches?"

"Pockets," said I, "are useful to the male itinerant to carry various little essentials to his comfort, the chief of which, perhaps, is his pocket-book. The tailors, who don't seem to charge extra for them, are responsible for their multiplicity, which is oftener a cause of confusion, vexation, and loss than a convenience. Now closets are by no means a gratuitous institution. They clip the purse, as they do the fair proportions of the rooms; are cramped, dark, musty harbors for vermin; rummaging holes, where you may find every thing except what you are looking for; receptacles for all the trash that ought to be burned or given away; the tag ends of garrets, with ever-jangling locks and lost keys; contrivances which may be useful in that sad refuge of social vagrancy, a boarding-house, but should never be tolerated in a home."

Madame listened with eyebrows arched in amazement, and when my tirade ended, put in her surrejoinder, as follows: "I never conceived that such sentiments could be entertained by an enlightened being. They might be excused in an ignorant savage who carries all his stores in a dried weasel's skin, or a soldier accustomed to housekeeping *en bivouac*, but where in the wide, wide world is a Christian housewife to bestow her table china, her bed linen, her pickles, preserves, and jellies, her extra dresses, furs, and bandboxes, and all the progressive and accumulative appliances of civilized housekeeping?"

My rebutter was plausible and insinuating, profusely illustrated with the pencil. I hoped I had provided satisfactorily for all that. We had more rooms than we needed or cared to furnish. Here was one, twelve by sixteen, fitted up with shelves, hooks, counters, and drawers, with special lock-ups if desired; light, airy, and rat-proof; large enough to hold all the crockery and grocery stores we would ever be likely to accumulate; another above, of the same size, with shelves, pegs, drawers, and presses for the dry-goods—the whole commissary department under two keys. Was not that better than four-and-twenty cuddies scattered all over the house?

The brilliancy of my rhetoric silenced my adversary for the moment, but when a woman has her head full of closets, they can never be opened by argument. She, however, signified her willingness to give my whimsies a trial, at the same time reiterating her conviction that it was impossible to keep house without closets.

A truce being thus concluded, all the cunning artificers within reach were called to execute the plans, and at the end of about six weeks their work was completed. During the process all the evil spirits which had formerly disputed the occupancy with us had departed. It was now ready for the refurnishing.

Most enterprises begun in enthusiasm end in reflection, and since the beginning of history building has been a very uncertain and ticklish business. The abandonment of that famous contract and the confusion of tongues on the plains of Shinar were doubtless caused by the non-payment of the workmen's bills, or a strike for higher wages; without being able to read hieroglyphics, we can easily believe the financial credit (as well as the mummies) of the dynasty of Cheops lies buried in those Pyramids; it was not disappointment in love that set the wise King Solomon to sighing "All is vanity," so much as the expense and debts incurred in erecting that gorgeous edifice

> "On the mount of Moriah,
> Hard by Jerusalem;"

St. Peter's reduced the papacy to endless beggary, while Versailles brought the old French monarchy to bankruptcy and ruin; even the shrewd Walpole was crushed by an ambitious villa, and George Francis Train went into impecuniosity all for a cheap tavern in Omaha. In short, our artificers exhibited as much of their traditional "cunning" in devising their bills as they had done in their work. But we were too much delighted with the results to grumble, so we squared off with apparent cheerfulness, and still rejoiced in an attenuated balance in bank.

This circumstance, combined with some sound philosophy on my part and madame's

amiable acquiescence, simplified the business of furnishing considerably. (I think the bow-window did the thing, after all.)

Our old furniture, retrieved from its various places of concealment, looked so much better than we expected, and was so substantially comfortable, that we concluded to make it answer our purposes. Invalid chairs and tables were doctored and restored to rank and service, while such new pieces as were needed were modestly chosen, so as not to shame the old by expensive incongruity. The hall was adorned with trophies of the fight and chase, according to the old baronial fashion. We had some family portraits and sombre-toned paintings to dignify our parlor, with pictures of a lighter character to make our dining-room cheerful. On our quaint old spindle-legged brass-bound sideboard shone some bits of silver-ware which had come by inheritance or compliment, while the clocks on the mantels were flanked by tall plated candlesticks and pictured porcelain flower-pots; a piano, a violin, two presses full of books; a what-not displaying a collection of minerals, fossils, shells, and various articles of virtu, among which were an owl's claw, a humming-bird's egg, a wild-turkey's beard, a rattlesnake's tail, and a hornets' nest. And now pray what more could any reasonable person desire, either for comfort or show? And so we walked together from room to room, regarding our arrangements with great complacency, openly challenging the world to suggest any improvement, and carefully abstaining from any allusion to a reserved list which each of us bore in mind for some future day. Not a word was said about pier-glasses, nor mosaic tables, nor chandeliers, nor ceramic mantel-pieces, nor French bronzes, nor *bric-à-brac*, and it was only in reply to my own thoughts that I got off the following remarks:

"Formerly the genius of the arts devoted herself exclusively to the glorious temples of religion and the luxurious palaces of kings. With the progress of democratic opinions she has condescended to smile upon the homes of the people. While the recognition is flattering, refining, and morally elevating, it is like a rich man's civility—financially embarrassing. In return therefor we are expected to turn our houses into gratuitous toy-shops and æsthetic museums, ruinous to collect and onerous to maintain. In this region, for some years to come at least, the loftiest aspirations of domestic art will be to provide three wholesome meals a day, and to entertain our next-door neighbor Poverty with a cheerful grace. But while decorative whimsies and artistic manias may serve to divert the occupants of a city house from *ennui* or mischief, the pride of a country home should ever be in its grounds and garden."

The re-establishment of ours had been commenced and carried on *pari passu* with the refitting of the dwelling. I had had it fenced with seven-foot split oak palings, double nailed—an inclosure which served to elevate the moral sense of all the juve-

A MAN'S IDEA OF A CLOSET.

nile free agents in the village. Here we retreated from the hammering and paint-pots of the workmen in the house, and during the sweet May mornings established our head-quarters under a tree, where we planned and superintended the horticultural improvements.

Neither wife nor myself had any practical knowledge of gardening. We had some vague and childish recollections of having assisted in dropping peas and beans, and of having been permitted to slop water over the newly set cabbage plants. We had also sowed pepper-grass in the borders, and enjoyed the pleasure of seeing our initials sprouting in green embroidery. But that had been in "auld lang syne," and now we were relying on one of Bliss's catalogues and Uncle George's pretentious but rather

ELEVATED MORAL SENSE.

confused directions to get in our vegetable crop. In the ornamental department we were better posted. My lady had a speaking acquaintance with the most fashionable flowers and ornamental shrubs, while on the subject of rural art generally I had very decided opinions, and, like Mr. Ruskin, could talk better than I knew.

Now our lot was located among hills and mountains covered with primeval forests. There were in view all varieties of deciduous and evergreen trees and flowering shrubs produced in the Middle States. In due season we might see from any point within our inclosure the rich and varied greenery of the mountain-sides illuminated with the dogwood and redbud, the blooming chestnut, flowering ash, and majestic tulip-tree. The course of the stream was marked by blossoming hedges of hawthorn, wild crab, cherry, and service-berry. In the shaded dells the rhododendron flourished in its pride, while the kalmia, with its gorgeous masses of pink and white bloom, covered the land like a weed. The less-frequented village streets were choked with it, and in setting my fence posts we eradicated clumps which would have been the pride of a city park. In the woods were gnarled fantastic trunks adorned with the Virginia creeper, and sustaining the shadiest bowers of wild grape. There were cliffs and pyramids of lichen-clothed rocks radiant with wild pink, azalea, and clematis. There were crystal springs trickling from mossy grottoes, and nourishing ferneries that were enough to break an enthusiastic amateur's heart with envy. Amid such surroundings I recalled the words of Michael Angelo, when, called to Rome to finish St. Peter's, he turned to take a last admiring look at the Florentine triumph of Brunelleschi:

"Simile non voglio;
Meglio non posso."

So our garden was planned after the formal pattern, in mathematical figures, with clipped hedges, trained trees, and all exotic and civilized plants—a gem of art in the midst of a natural wilderness. Our neighbors thought it a "triumph of genius," and they were right, for that means only "something different" from what people have been accustomed to.

As we sat one morning in our Eden, with the succulent sap of our great ancestors swelling in our veins, and the instinct of their divine mission tingling in our fingers, a gentleman in black approached, and in a very beguiling and serpentine manner asked permission to show his wares. I did not observe whether or not he had a cloven foot, but he had a black oil-cloth haversack from which he drew two well-thumbed folios, and handing one to each of us, complacently announced himself a travelling nursery agent, and then took a seat on the grass to await developments.

The book in my hands was filled with the most gorgeous chromatic pictures of all the popular fruits, while madame's showed flowers under the same kaleidoscopic treatment. What I saw was to me a revelation of wonder and delight; from her exclamations and frequent demands for my attention, my lady was equally infatuated with her share of the show. At length we agreed to go over the books together, commencing with the fruits. This we did, pencil in hand, making a list of such as we most admired. How that subtle peripatetic must have enjoyed the innocent enthusiasm of the two matured denizens of society, entering, as it were, into the blissful babyhood of a new life!

When at length our list was completed and handed to the agent, he considered it with a smile, and asked the size of my farm. I informed him that the lot in which we sat was the only land I proposed to cultivate and plant.

"Your order," said he, "would stock a ten-acre farm, and will cost, let me see—"

"Don't trouble yourself to make the calculation," I replied, hastily; "but take this pencil and make out a list suitable for this ground, and one that will give me fruit three hundred and sixty-five days in the year."

He went to work conscientiously, and in half an hour handed me a list containing twelve manner of fruits, with the early and late varieties of strawberries, currants, raspberries, blackberries, cherries, apricots, peaches, plums, grapes, quinces, pears, and apples.

"As amateurs generally plant close, I think," said he, "you can get all these in your garden, and if fairly successful, they will yield you an abundant supply of fruit all the year round."

Madame made her own list of roses and flowering shrubs. The agent complimented her taste, made his smiling bow, and departed. In due time the trees and plants were received and put in the ground. Meanwhile our zeal had been so stimulated by the visit that I at once subscribed for several horticultural periodicals, and sent for the illustrated catalogues of the leading nurseries and floral establishments.

HORTICULTURAL AUTOGRAPHS.

It would be difficult to convey to the uninitiated mind a just idea of the charm of a florist's catalogue, yet we know of no literature at once so instructive and interesting. One may learn therefrom enough of botany to satisfy the ambition of a modest amateur, and Latin enough to puzzle a country school-master, yet all the while the reading steeps the very soul in poetry. Technical drudgery sadly cripples the poetry of art, while the disgusting impertinence of criticism often kills it outright. But flowers are the spontaneous effusions of Nature: her inspired children, "who toil not, neither do they spin," and are never infested with critics; whose infantile sweetness beguiles the lowly into forgetfulness of poverty and suffering, and helps the queen upon her throne to bear the weary burden of her state.

The profound and eloquent Ralph Waldo Emerson says: "Thomson's 'Seasons,' and the best parts of many of the old and many of the new poets, are simply enumerations by a person who felt the beauty of common sights and sounds, without any attempt to draw a moral or affix a meaning."

According to this definition we may feel justified in calling our floral catalogue a poem, as, indeed, it always has appeared to us in the spring season, filling the air we breathe with suggestions of voluptuous perfumes, and our grounds with gorgeous borders and blooming ribbon beds.

But one can not gloat over poetic enumerations and the like for more than five hours at a stretch without being reminded that he is not yet a butterfly to be fed on flowers, but still subjected to the base necessities of a more substantial grub.

Now the house was done and the garden seeded and stocked, and madame had begun to get a little wearied with the romance of our pseudo camp life and baked potatoes three times a day, so she persuaded George and Kitty to take quarters in the kitchen to assist in opening the romance of real housekeeping.

"What!" exclaims a dainty miss, lifting her blue eyes from the pictured magazine; "can there be any romance in so practical and commonplace an occupation as housekeeping?"

Certainly, my fair pupil. The loving

heart, the earnest will, and a spice of novelty withal may cast such glamour over our homeliest pursuits that in certain seasons lamb with mint sauce may appear quite as romantic as lamb in the wool, and the spitting of a plumed rival in the armed lists less admirable than the spitting of a picked goose in the kitchen. Do you doubt it? Then wait until you and —— have set up on your own hook, and we will wait to hear your experience.

So far so good. We were at length actually established in our own home, eating *vis-à-vis* at our own table, and sitting of cool evenings by our own fireside. Our vine and fig-tree had not grown sufficiently to cast a shadow, but our early peas were up, and it was simply delicious.

Then a pretty, civilized cat visited us, and being kindly entreated, took up her abode with us. Her appearance gave a domestic feeling to the premises, and suggested the idea that we wanted more live stock to complete our establishment. So we added a couple of pigs, which were penned to fatten on the surplus of the garden and kitchen, a calf, destined to be a cow some day, to give us milk, a family of top-knot chickens to lay eggs and enliven the lawn, and a terrier pup that was to be our friend and watch-dog.

These accessions did enliven the household considerably, but the introduction of so many varied tastes and clashing interests rather disturbed the peace of our Eden. I dare say it required some time and an amount of sublime self-denial to establish Barnum's Happy Family. Ours was a crude assembly, and didn't try to get along at all. The rooster fought with his neighbors until he lost his comb and got his eye knocked out; the hens scratched up the peas and ate the strawberries; the cat ate the young top-knots; the pup worried the cat and sucked the eggs; the pigs jumped out of the pen and rooted up the cabbages; the calf butted the cook and nibbled the shrubbery; the cook watered the coffee, burned the biscuits, and scalded the pup—and they fought on that line all summer.

But if we are willing to wait patiently, time will heal all griefs. Ere long the twilights began to linger and the evenings grew frosty; the garden products were gathered and stored; the hens were cooped; the calf sent out to winter pasture; the pigs to hibernate in the lard firkin and pickle barrel; the pup was drowned—"Requiescat in pace." And there was peace in all our borders, and we drew our table nearer and nearer to the glowing hearth, wife with her sewing and I with my books, frequently suspending our respective occupations to hear and suggest future plans and improvements, or to discuss various nice questions in domestic economy, all diplomatically tending to the solution of the great question, By what code was our newly established home to be governed, and by whom?

I modestly hinted at the expediency of a dual government, citing the example of the ancient Romans; but madame declared dual governments meant nothing but strife, confusion, and inefficiency. She preferred to have duties divided and authority defined.

Of course I was to be the recognized and undisputed head of the house and family. I was also to exercise absolute authority over my books and private study, subject only to weekly visitations for the necessary enforcement of police regulations. I was also invested with dictatorial powers over the stable at the further end of the lot, but as we had no horse at the time, this was only dignity without responsibility. For the rest of the establishment and every thing in it, madame proposed to run it herself according to the best of her judgment and discretion. The more I studied over this plan, the more simple and comprehensive it appeared. Possibly it might have worked satisfactorily, but ere we had time to test it our home was invaded by a power which upset all our theories so completely that we have never alluded to them since.

FINIS CORONAT OPUS.

MARIA BROOKS.

MARIA DEL OCCIDENTE.

"My purpose had now become fixed, and despite of the night I had passed, my appearance, though pale, was *calm to those around me;* but if the soul which now warms me be eternal, the remembrance of that day, so calm to those around me, will continue to the latest eternity....I next looked over a small trunk of papers. From time to time they had been saved, when my imagination was under the influence of a *strong but vague hope that I should one day or other be loved and renowned, and live longer than my natural life in the history of the country of my forefathers*, and that where I first beheld the light. Now, I said, no mortal shall smile at the fancies of lonely Idomen."

—*Idomen; or, The Vale of Yumuri.*

IN Cuba, near Limonal, on the San Patricio coffee estate, Cafetal Hermita, stand, now crumbling in picturesque decay, the ruins of a small Grecian temple, where, some thirty years ago, the very passion-flower of womanly genius exhaled itself away. The flight of steps leading to this little temple is overgrown with clambering vines that mingle their dark leaves and gay flowers across the deserted entrance. The path leading to it is an avenue of stately palms, whose matted leafage completely shelters the way from the sun, while the straight shafts of the palms, wound about with ipomœa and convolvulus, have the appearance of themselves putting forth the rich blossoms of these vines.

The little temple is bowered in a labyrinth of orange-trees, cocoas, and palms, the mango and rose-apple, the ruddy pomegranate and shady tamarind, while the coffee fields spread away in alternate tessellation of white flowers and scarlet berries.

A traveller thus alludes to this fair retreat: "I have often passed it in the still night, when the moon was shining brightly, and the leaves of the cocoa and palm threw fringe-like shadows on the walls and floor, and the elfin lamps of the cocullos swept through the windows and the door, casting their lurid and mysterious light on every object, while the air was laden with the mingled perfumes of the coffee wreaths and orange flowers, the tuberose and night-blooming cereus, and have thought no fitter birth-place could be found for the images she created."

Here, in the retirement of the rarely disturbed repose and beauty of Hermita, lived and passed away, almost unheard and unnoticed, "Maria del Occidente," one of earth's great singers, whose numbers, having always grace and sweetness, have often also the majesty and the fervid pathos wrung in a narrower tide from Mrs. Caroline Norton by her passionate sense of her own wrongs, and from Mrs. Browning by her yearning compassion over others' woes.

And to crown these gifts Maria del Occidente had a pure recognition of the Infinite design as manifested through the mysterious passion of love, which in its full, simple, unabashed expression makes her "Zophiël" among the bravest and the most modest of the creations of genius.

Eighty-two years ago, in the town of Medford, Massachusetts, she was little Maria Gowan, a baby girl around whom no special hopes were clustered, and whose baby brows foreshadowed neither the glory nor the sorrows of the poet's purple-fruited laurel.

She was born and bred American; but it is not unlikely that the blood of the Welsh bards, from whom she claimed lineage, may have tinctured the fine current of her veins. Her short life of only fifty years was one of comparatively little outward incident, yet these, mostly of her own shaping, indicate the dignity and strength of her character, and mark her stainless wifehood and her devoted motherhood. But her poems, especially her great work "Zophiël," show that her mental and spiritual life was a passionately vivid eon of intense experiences, and beneath the strong music of her verse breathes ever the cry of the conscious isolation of great gifts, the supreme longing for complete human sympathy.

In all the individual utterances of high desire or passionate feeling throughout "Zophiël" it is her own soul imprisoned by fate, yet liberated by genius, that pleads, yet heroically endures. "Zophiël" was first published entire in London by Kennett, under the care and fostering of Robert Southey, who, in *The Doctor*, quotes from the sixth canto of "Zophiël:"

"The bard has sung, God never formed a soul
Without its own peculiar mate to meet
Its wandering half, when ripe, to crown the whole
Bright plan of bliss, most heavenly, most complete.

"But thousand evil things there are that hate
To look on happiness; these hurt, impede,
And, leagued with time, space, circumstance, and fate,
Keep kindred heart from heart to pine and pant and bleed.

"And as the dove to far Palmyra flying
From where her native founts of Antioch beam,
Weary, exhausted, longing, panting, sighing,
Lights sadly at the desert's bitter stream,

"So many a soul o'er life's drear desert faring,
Love's pure congenial spring unfound, unquaffed,
Suffers, recoils, then, thirsty and despairing
Of what it would, descends and sips the nearest draught."

And adds: "So sings Maria del Occidente, the most impassioned and most imaginative of all poetesses." The London *Quarterly Review*, with restricted appreciation, admitted Southey's praise, after substituting the word fanciful for imaginative. Charles Lamb, with that peculiar conceit which we may term the obsolete characteristic of great men, enforced by the potent thrall of "Zophiël," rose from the reading of it with these words: "Southey says it is by some Yankee woman: as if there had ever been a woman capable of any thing so great!"

With all that can be gleaned from reviews and the brief contemporaneous sketches which followed the publication of this work, and were revived with some slight additions at her death, her life is involved in great obscurity, which I have found it difficult to penetrate, and have been able to disperse only in faint and narrow lines, even after the continued and earnest effort and research of several years.

Her single prose story, *Idomen*, of which I shall speak later, is undoubtedly to some extent autobiographical, and within the limits of that vivid little sketch are the chief clews to the exceptional experiences of her private history. Her father was a gentleman of literary tastes and cultivation, intimate with the Harvard professors. Nowhere do I find any mention of her mother. Rufus Wilmot Griswold, in the *Encyclopedia of American Literature* (1856), and in the *Female Poets* (1853), and in the *Southern Literary Messenger* (1839), gives the most adequate sketch of our author's life. He knew and corresponded with her in her later years; and says that when only nine years old little Maria Gowan's poetic temperament and power were clearly indicated by her avid committal to memory "of passages from Comus, Cato, and the ancient classics." That she became a student of wide and accurate learning is disclosed in her works, the notes of "Zophiël" alone being a groundwork of erudition as thickly sprinkled with occult bits of thought, research, and profound study as the tunic and tresses of an odalisque with gems.

On the death of her father she was engaged, at the early age of fourteen, to Mr. Brooks, a wealthy Boston merchant, and soon after married to him; and after reverses of fortune resulting in poverty, she turned her attention to the definite expression of her genius, and at twenty had written a poem in seven cantos, which was never published. In 1820 she issued the little volume, "Judith and Esther, and Other Poems, by a Lover of the Fine Arts," whose genuine poetic worth met with some appreciation. In 1823, becoming a widow, she went to Cuba, making her home with a relative, and there wrote the first canto of "Zophiël; or, The Bride of Seven," publishing it in Boston in 1825. After the death of an uncle, a Cuban planter, whose property, left to her, placed her in easy circumstances as the possessor of a fixed income, she returned to the United States, and lived near Dartmouth College, where her son, Captain Horace Brooks, of the United States army, was then studying, and where she made studious use of the Dartmouth College library. In 1830 she went with a brother to Paris, and in London met Washington Irving, who most kindly encouraged her in the production of her poem. But it was with Southey, at Keswick, where she passed the spring of 1831, that she entered into that strong and sympathetic friendship which fed her pure aspiration with the appreciation and hope that kindle and assure.

Fortunately I can swell these slender outlines with some brief testimony from persons still living, to whom I would here express my grateful acknowledgments.

In 1872 her son, then stationed at Fort M'Henry, Baltimore, Maryland, wrote to me as follows:

"I received your note, addressed to the Rev. C. Brooks, Medford, through my cousin Mrs. Ellen Parker, of Boston. I have no papers of my mother's near me, nor can I at present get at them. I have, however, a fine miniature done by a young artist (at the time it was taken), which is probably the best likeness that can now be obtained, and which I will forward to you.... When I was in Cuba in 1846 the little dilapidated temple (built to gratify my mother by her brother) on the San Patricio coffee estate, in which most of 'Zophiël' was written, was still standing, also a monument—a granite base surmounted by a marble cross—at Limonal, not far from Matanzas, erected by me, at mother's request, over my two brothers. There is her resting-place by their side. I cut her name upon the marble with my own hand, to correspond with the inscription which mother placed over her sons."

In July, 1872, I wrote to him begging him to send me the picture of his mother, and requesting fullest particulars of her life and death, her character and peculiarities, and all details and incidents of interest. To this Colonel Brooks replied:

"Fort M'Henry.

"The first peculiarity of my mother was that she wrote a round and remarkably plain hand, which I do not, and which you must excuse, for the reason that I seldom write for publication. I will send the miniature. I have but one copy of 'Judith and Esther,' which I fear to part with, as I know not where to get another. My changeable life has prevented my keep-

ing any thing safely. I can not at present get at any papers of my mother's, and do not know that there are any left such as you might desire.

"The little temple (of which I have no picture, nor of the monument) was built about 1825, and my mother died about 1845. I recollect it when a boy as a pretty little toy at the end of a beautiful avenue, four rows deep, of palms, interspersed with orange-trees and many other tropical plants. It was a charming spot, and illustrates mother's admiration of the picturesque.

"Whatever charm there may be in 'Zophiël,' and whatever talent it may portray, much undoubtedly is due to the surroundings of the miniature temple where the poem was imagined and its verse constructed by a nature as passionate as the name of the flower would indicate which she always wore in her hair, the only simple adornment of naturally thick and beautiful tresses.

"A lady of position recently visited this fort, and spoke to me of recollecting my mother's peculiarity of dressing always in white, even to white silk stockings and slippers: '*La dame blanche*' probably originated in some similar peculiarity. My mother's special characteristic was individuality. She generally succeeded in her endeavors.

"For instance, she applied to have me sent to West Point, and sent me to Washington in 1829 with letters, etc. The appointment was promised, but by some influence was overruled. She then took me to Hanover, New Hampshire, with a view to my entering Dartmouth College. In the mean time she went with her Quebec brother to Europe, where she visited Southey, and by his advice and protection got out a London edition of 'Zophiël.' She was introduced to Lafayette, who was so pleased with her that he urged to know if he could be of any service to her. 'Yes,' said she; 'you can get my son into West Point.' Upon this Lafayette wrote to Bernard, our then Chief Engineer, and the appointment of a cadet came to me.

"Southey was undoubtedly much interested in the American authoress, for when, after his death, I visited his family, they asked for the correspondence as their right, and I subsequently sent several letters to them."

Upon receipt of this letter, with the promised portrait of his mother, I wrote again, thanking him for the use of it, and saying that the completion of this tribute still depended greatly upon him, which I explained as follows:

"Since my last letter to you I have heard from Richard Hengist Horne, of London, who has cordially interested himself to gain information in this matter. He has obtained a hint from Robert Browning, and is in communication with Alfred Tennyson. Mr. Horne is an indefatigable worker, a man of brilliant abilities, with a wide and intimate acquaintance among distinguished men and women. Our own venerable poet Longfellow, during a recent visit at his home in Cambridge, told me that the most important step in my effort to write effectively of your mother was to secure the examination of her private papers. I told him what you had written about their being difficult of access, but he seemed to feel sure you would overcome all difficulties, or put me in the way of doing so. If you can not obtain the papers yourself, will you not tell me where they are, or authorize me to get them myself? I need hardly assure you that I will take the utmost care of them, and use your confidence with the delicacy due to it and to her memory. I entreat this favor of you in your mother's name, since it is for her sake."

Colonel Brooks very kindly sent me his copy of "Judith and Esther," and also of *Idomen*, and continued his account:

"My mother was quite a linguist. She read and wrote fluently in French, Spanish, and Italian; she also sang many songs in these tongues. She was a hard student, and a woman of much research, and very particular to obtain her authority from the original, and often attempted, with the assistance of some friend, the translation of obscure languages. I remember that she kept by her a Persian grammar, and often referred to it. She was also quite an artist, and several pieces painted by her in water-colors were hanging up about her rooms. She had a remarkable memory, and many curious facts she had stored in her mind, in scraps of poetry she had learned in her youth.

"Indeed, her mind took a poetical current from its earliest years. She had a remarkably beautiful form. I have heard her say that when young, before the days of flowing skirts, when dresses were scant, she often felt ashamed of herself on account of what are now considered curves of beauty being then too well defined. She was a constant attendant at church, and always carried with her an English edition of the services of the Church, but she detested all cant and hypocrisy. She was very particular about her own language, disliked all interpolations, and always referred to Johnson and Walker. It was delightful to hear her converse; her knowledge of present and past events and of the prominent characters of history was astonishing. She would tell anecdotes of persons so varied and interesting that her quiet and unassuming conversation was sought and listened to by many distinguished persons.

"I remember of her travelling with her brother several miles in order to see an Indian chief, and get the precise accent and signification of an Indian word."

In 1874 I wrote again to Colonel Brooks, then in Presidio, San Francisco, with reference to his mother's private letters and papers, offering to relieve him from all inconvenience and expense, by sending a responsible person for them, if he would consent and designate their abiding-place. To this he replied substantially as before, that they were scattered about, he hardly knew where himself; that no one but he could "unravel the condition of affairs," and it was impossible for him to come East at present.

In the intervals between this correspondence with the son, I met with the most cordial response in other directions of inquiry. In July, 1872, I received the following kind letter from her niece, Mrs. Ellen Parker, of Boston:

"Your letter to the Rev. Mr. Brooks was sent to me, I being a niece of Maria del Occidente, and I thought it the best way to assist you, in the beautiful work you think of undertaking, to forward your letter to Colonel Horace Brooks, her only remaining son, and he, of course, would have in his possession what you would require. In all my life I never passed more than a few months in the society of my aunt Mrs. Brooks; but to my girlish vision she always appeared a being of the most romantic loveliness and grace. She *always* dressed in white or gray, wearing transparent sleeves, through which her beautiful arms were seen, and her hands were almost always covered in white kid gloves. She seemed to *reverence* her own personal charms, and felt it a duty to preserve her own sweetness. When past the meridian of life her hair and teeth were as beautiful as those of a young girl. I should say that a keen sense of truth and justice, and the most delicate perceptions and actual worship of beauty, were the predominant traits of her character. I regret that I have nothing in my possession which would assist you."

The Rev. Alfred Brooks (brother of the late Rev. Charles Brooks, of New England fame as the "Father of Normal Schools"), to whom I wrote, supposing him to be a

relative of the poetess—in which supposition I was mistaken—interested himself most kindly to open a way for me, and it is to him I owe the foregoing graceful letter from Mrs. Parker, as well as my first letter from Colonel Brooks, and the perusal of one from Miss Lucy Osgood, who, in mentioning a visit of Mrs. Maria Gowan Brooks to Medford, says, "I have a dim recollection of a lady walking out at odd hours, and dressed in white at odd seasons, and of being told that she was Mrs. Brooks, of the Gowan family, a poetess. She and her family soon disappeared, and I afterward found, chiefly through a long, respectful article in one of the English reviews, that we had had a flower of genius among us, and in our stupidity knew it not."

By another Medford lady—Miss Eunice Hall, who frequently saw her—Mrs. Brooks is described as "a very handsome lady, winning manners, purest blonde complexion, blue eyes, abundant pale golden hair, who wrote poetry and sang very sweetly."

As woman, wife, mother, poet, and friend, in every relation of life, and in its details of dress, appearance, and manner, Maria del Occidente seems to have been a being of the most singular and attractive interest.

In 1876 I had some correspondence with the Southey family and the Coleridges. Their letters, without exception, were kind and full of desire to assist me, but they were unable to furnish much new material.

From one of these letters, written by the Rev. Derwent Coleridge, I quote: "Maria del Occidente does indeed deserve to be honorably remembered among the first poets of her native land. It is difficult to recover memorials of a life that is sunk beneath the stream of Lethe. A copy of her 'Zophiël' was presented to my dear sister Sara Coleridge by Mr. Bancroft, the American minister, in 1834, and is now in my house." The wife of Rev. Derwent Coleridge pushed inquiry for me among the Southeys, and sent the following from Mrs. Herbert Hill, a daughter of Robert Southey: "I fear I can give no account of Mrs. Brooks that will be of any use to her biographer and friend. I have no personal recollection of her, having been away from home during her stay at Keswick, but I well remember how full of her charms the letters were that I received from home at that time. Herbert has looked through my father's *Life and Correspondence*, and has copied out the only thing worth stating"—which was from the "Selection of Southey's Letters," edited by J. W. Warter.

"KESWICK, *October* 13, 1833.

"MY DEAR MRS. BRAY,—....Has 'Zophiël' fallen in your way? Probably not, for books which have only their own merit to introduce them make their way slowly, if they make it at all. The authoress, who calls herself Maria del Occidente, is a widow, by name Mrs. Brooks, a New Englander by birth, of Welsh extraction. She married—or, to speak in this case more correctly, *was married*—when almost a child, to a person at least thrice her own age, and as little suited to her in other respects as in years. He left her with two sons, one of whom is now an officer in the American army, the other settled as a planter in Cuba, where most of 'Zophiël' was written. Mrs. Brooks, I doubt not, always has been, and still is, haunted by the feeling that if she had been mated with one capable of esteeming and loving her as she deserved to be esteemed and loved, she should have been one of the happiest of God's creatures. In appearance and manners she is one of the gentlest and most feminine of women. Her poem is, in the foundation, the story of Tobias and Raguel's daughter; yet it is a most original composition, highly fanciful, and passionate in the highest degree. It has the fault of not being always perspicuous; but that any person who has read few, if any, of our elder poets, and certainly never studied any of them, nor looked upon poetry as an art, should be so free from the vices of modern diction, and possess so much of elder simplicity and beauty and strength, is most remarkable. Altogether the poem is the effusion of a heart whose fervor neither time nor untoward fortune has cooled, and of an inspiration so vivid that it almost believes in its own creations. There is a song in the last canto which is more passionate than any I can call to mind in any language, and in my judgment far, very far, superior to Sappho's celebrated ode."

I give also, somewhat abridged, the following interesting letter from Southey's son-in-law and literary editor, the Rev. John Wood Warter, who was over seventy-one years of age at the time this quaint and readable letter was written:

"I have deferred answering your letter till I had tried to find out if any letters of Maria del Occidente were in possession of the Southey family. By this morning's post I have a letter from my brother-in-law, the Rev. Cuthbert Southey, in which he states that there are none, adding that he well remembers her visit to Keswick. My lamented wife, Edith May Southey (Southey's eldest daughter), knew and liked her. At Southey's sale she requested me to buy the MS. of 'Zophiël,' which I did, and it is before me now. We received more than one little parcel from her of guava jelly, and two book-screens, which are now on my mantel-piece. I rather suspect more is known of her than you suspect. Probably she may allude to herself in that stanza quoted in *The Doctor*. It was generally believed that she was married, when a mere child, to an elderly man at least thrice her own age; but I have only picked this up from private letters, and can state nothing on authority. Southey often spoke of her, as did my wife, as of a gentle, pensive person, quite different from what might have been expected from the gifted and impassioned author of 'Zophiël.' She won the regard of all the household during the few weeks of her stay at Keswick. Since I received your letter I have carefully read through 'Zophiël' again, and think it as wonderfully clever as ever; but it was ill adapted to the English taste, which had been surfeited with 'Don Juan' and Moore. The manuscript is perhaps the greatest scrawl you ever saw. I regret I am unable to give you more information, but you may depend upon it, it is to be found either in 'Kuba' (as she pronounced Cuba) or about Matanzas. Most of my American correspondents are past and gone. The late Jared Sparks, his wife and family, visited me here some years ago. He too has been gathered in. He brought to my daughters autographs from Longfellow."

The following letter was written by Richard Hengist Horne in answer to inquiries about Mrs. Brooks:

"With regard to Maria del Occidente, I perfectly recollect reading a review in one of our Quarterlies of her poem in conjunction with several others, most of

whom seemed to wither beside her burning spirit. I agree with what Southey said of her superiority to all other poetesses, my dear friend and correspondent Miss E. B. Barrett (afterward Mrs. Browning), not having appeared at that time. You are aware that the latter was also a star from the West, and either born in the West Indies or of parents born there. I fear what you want concerning Maria Brooks is scarcely attainable now. Twenty years ago, when I went to Australia, I could probably have helped you. Miss Mitford, Mrs. Browning, Charlotte Brontë, Mrs. Hemans, and Miss Landon (L. E. L.) could most likely have told you more or less of Mrs. Brooks. So could Jordan (of the *Gazette*), Leigh Hunt, Robert Bell, and others; but, alas! all these and more young literary friends are gone. By-the-bye, it is possible that in Bell's edition of the *British Poets* you may find her mentioned. In case you have not the work, I will look into it the next time I am in the British Museum Library, and if there be any thing worth copying out, I will send it to you. Tennyson and Browning may have known something of her."

Later he adds:

"I inclose Browning's reply with regard to Mrs. Brooks: 'As to Maria del Occidente, I know the name, but never remember hearing it from my wife. You revive old impressions in me that there is real worth in her poetry, judging from the echoes rather than the veritable voice, which I never heard, and I wonder that I can give you no sort of account of the lady.'"

In this letter Mr. Horne very kindly sent the following charming little sonnet, never before published. Its closing lines are in sympathy with the dark suggestiveness in the abrupt catastrophe of *Idomen:*

SONNET.

TO THE MEMORY OF MARIA DEL OCCIDENTE.

We gaze into the western skies,
  Where Cuba sleeps beneath the silent stars;
The splendor fills and overbrims our eyes,
  And all earth's coil outbars.
We note amid the host one special light,
  Our thoughts then melt toward the Eternal Giver
Of pure Infinitude to mortal sight;
  We look again—*that* light is gone forever!
Where hath it gone? where hath its glory fled?
  Who saw it as we saw it? what delight or terror
Can picture its bright throne among the dead?
  Alas! for that soul's fire—lost, shot astray,
  Leaving few records in our night or day.

September 12, 1872.

Early in 1876 I made one more appeal to Colonel Brooks, reiterating my desire for the possession of his mother's papers. He replied that no one but himself could possibly find them if any existed; that since her death he had "been through the old Mexican war, the new Mexican war, the Kansas war, and the rebellion, so you can imagine what changes have taken place, and how my effects are scattered. I gave a copy of 'Zophiël' to Adjutant-General Townsend, who will lend it to you, I think. If I go East this summer, I will endeavor to look up her papers, but I still doubt if any thing of importance could be found."

On my application for it, General E. D. Townsend at once placed his copy of "Zophiël" at my disposal.

"Zophiël; or, The Bride of Seven," is an Oriental epic. The foundation is the story of Sara, Raguel's daughter, of the Median city of Ecbatane, as given in the fifth, sixth, and seventh chapters of the book of Tobit, in the Apocrypha. Sara, a beautiful and good maiden, is bitterly reproached because "she had been married to seven husbands, whom Asmodeus, the evil spirit, had killed before they had lien with her." Unhappy in being the cause of so many deaths, and suffering from the reproaches, Sara prays for death, but that if she must continue to live, some mercy and pity may be shown her. In answer to this prayer the angel Raphael was sent to bring Tobias to the house of Raguel, where Sara should be given to him to be his wife. Nothing daunted by the father's confession concerning Sara's seven bridegrooms, Tobias entreats for an immediate marriage, and the evil spirit Asmodeus being overcome by a peculiar spell, the predestined nuptials take place. Upon this foundation the author of "Zophiël" enlarges, mingling the dramatic movement, situations, and passionate climaxes created by her own affluent imagination with the rich imagery and action of ancient myth.

With the threefold quality of the highest order of genius, the intuitive, perceptive, and creative, she detaches whatever she uses from its original source, and so imbues it with her own meaning, so individualizes it with her own inspiration, that it enters into a new crystallization.

The plot of the poem clearly indicates its author's purpose—to show how the passion of love affects individual fate, moulding and swaying both human and angelic nature. The scenery of the drama is painted, the characters are chosen, the circumstances for their development selected, to this end; and no expression of individual opinion, however appreciative, and no review or criticism, however good, can be as just to the poem as to give as much space as possible to the poem itself.

"Zophiël" opens with a strange appeal, in a mood both brave and desolate. As in mournful prescience of the lack of wide recognition she was to experience, the singer, from the solitude of her little temple, salutes the "shade of Columbus," her Cymbrian ancestors, the bards of Mona, and the "spirits who hovered o'er the Euphrates stream" before the first waking of Eve, seeming to entreat an audience of these.

The following extracts from the first canto—"A Grove of Acacias"—contain something of the argument of the whole poem, introduce the "bride of seven," and give the first act in the sixfold tragedy:

"The time has been—this holiest records tell—
  When restless spirits raised a war in heaven;
Great was the crime, and, banished thence, they fell
  To depths unknown; yet kept the potence, given

"For nobler use, to tempt the hapless race
  Of feeble mortals, who but form a grade
'Twixt spirits and the courser of the chase.
  Man! thing of heaven and earth, why thou wert made

"Ev'n spirits know not! Yet they loved to sport
With thy mysterious mind; and lent their powers,
The good to benefit, the ill to hurt.
Dark fiends assailed thee in thy dangerous hours,

"But better angels thy far perils eyed;
And often, when in heaven they might have staid,
Came down to watch by some just hero's side,
Or meet the aspiring love of some high-gifted maid.

* * * * * * *

"'Twas then there lived a captive Hebrew pair;
In woe the embraces of their youth had past;
And blest their paler years one daughter; fair
She flourished like a lonely rose, the last

"And loveliest of her line. The tear of joy,
The early love of song, the sigh that broke
From her young lip, the best-beloved employ;
What womanhood disclosed, in infancy bespoke

"A child of passion; tenderest and best
Of all that heart has inly loved and felt
Adorned the fair inclosure of her breast:
Where passion is not found, no virtue ever dwelt.

* * * * * * *

"Now oft it happ'd, when morning task was done,
And lotted out for every household maid
Her light and pleasant toil, ere yet the sun
Was high, fair Egla to a woody shade

"Loved to retire. Acacias here inclined*
Their friendly heads, in thick profusion planted,
And with a thousand tendrils clasped and twined;
And when at fervid noon all nature panted,

"Enwoven with their boughs, a fragrant bower
Inviting rest its mossy pillow flung;
And here the full cerulean passion-flower,
Climbing among the leaves, its mystic symbols hung."†

One day, while Egla is reclining in the acacia grove, she is joined by her mother, Sephora, who entreats Egla to choose a husband, or to permit one to be chosen for her. Egla, in reply, tells Sephora of the visit of an old man in the wood, who foretold to her the bridegroom who would one day come to her from the Euphrates, impressing his prophecy by revealing himself as the angel Raphael for an instant before vanishing. Sephora discredits, not Egla, but the vision, dreads the fading of Egla's youth and beauty, and beseeching her not to waste them upon a "thought love," says:

"'"'Tis as a vine of Galilee should say,
Culterer, I reck not thy support; I sigh
For a young palm-tree of Euphrates; nay,
Or let me him entwine, or in my blossom die.

"'"Thy heart is set on joys it ne'er can prove;
And, panting ingrate, scorns the blessings given.
Hope not from dust-formed man a seraph's love,
Or days on earth like to the days of heaven!'"

Egla yields a sorrowful yet gentle obedience to her mother's persuasions, and is left to sleep in her acacian bower.

"Now all the mortal maid lies indolent,
Save one sweet cheek, which the cool velvet turf
Had touched too rude, though all with blooms besprent,
One soft arm pillowed. Whiter than the surf

"That foams against the sea-rock looked her neck
By the dark, glossy, odorous shrubs relieved,
That, close inclining o'er her, seemed to reck
What 'twas they canopied.

* * * * * * *

"It chanced that day, lured by the verdure, came
Zophiël, a spirit sometime ill, but, ere
He fell, a heavenly angel. The faint flame
Of dying embers on an altar, where

"Zorah, fair Egla's sire, in secret bowed
And sacrificed to the great unseen God,
While friendly shades the sacred rites enshroud,
The spirit saw; his inmost soul was awed,

"And he bethought him of the forfeit joys
Once his in heaven. Deep in a darkling grot
He sat him down, the melancholy noise
Of leaf and creeping vine accordant with his thought.

* * * * * * *

"And now he wanders on from glade to glade
To where more precious shrubs diffuse their balms;
And gliding through the thickly woven shade
Where the soft captive lay in all her charms,

"He caught a glimpse. The colors in her face,
Her bare white arms, her lips, her shining hair,
Burst on his view."....

Believing that he sees a "faithful angel" in the beautiful sleeper, Zophiël turns to depart, but is arrested by a sigh from Egla; perceives that she is but a mortal maiden, though so fair; and in the yearning of his naturally loving soul, intensified by banishment, resolves to win her love for himself.

"'"She has fall'n asleep in grief; haply been chid,
Or by rude mortal wronged. So let it prove
Meet for my purpose: 'mid these blossoms hid,
I'll gaze; and when she wakes, with all that love

"'"And art can lend, come forth. He who would gain
A fond, full heart, in love's soft surgery skilled,
Should seek it when 'tis sore, allay its pain
With balm by pity prest: 'tis all his own so healed.'"

On the night set apart for the marriage of Egla with Meles, the reluctant girl retires to her chamber and prays for a submissive spirit to do her parents' will. From this melancholy devotion she is roused by the coming of Zophiël, which is thus described:

...."Quick as on primeval gloom
Burst the new day-star when the Eternal bid,
Appeared, and glowing filled the dusky room,
As 'twere a brilliant cloud. The form it hid

"Modest emerged, as might a youth beseem;
Save a slight scarf, his beauty bare and white
As cygnet's bosom on some silver stream,
Or young narcissus when to woo the light

"Of its first morn that floweret open springs;
And near the maid he comes with timid gaze,
And gently fans her with his full-spread wings,
Transparent as the cooling gush that plays

"From ivory fount. Each bright prismatic tint,
Still vanishing, returning, blending, changing,
About their tender, mystic texture glint
Like colors o'er the full-blown bubble ranging.

* * * * * * *

"Love-toned he spoke: 'Fair sister, art thou here
With pensive looks, so near thy bridal bed,
Fixed on the pale, cold moon? Nay, do not fear
To do thee weal, o'er mount and stream I've sped.

---

* "Some of the acacias of the East are endowed with a sensitive power, and are said to bend gently over those who seek their shade."—Author's Note.

† "Those who have only seen this flower as a curious exotic in severer climates can have little idea of the profusion with which it grows in its native realms. It climbs from shrub to shrub, forming natural bowers, sparkling with morning dew, and looking from its beamy shape like a beautiful planet."—Author's Note.

" 'Say, doth thy soul, in all its sweet excess,
Rush to this bridegroom, smooth and falsehood-taught?
Ah, no! thou yield'st thee to a feared caress,
And strugglest with a heart that owns him not.
* * * * * * *

" 'But soothe thee, maiden; be thy soul at peace!
Mine be the care to hasten to thy sire
And null thy vow. Let every terror cease:
Perfect success attends thy least desire.'
* * * * * * *

" Thus spake he on, while still the wondering maid
Gazed, as a youthful artist; rapturously
Each perfect, smooth, harmonious limb surveyed,
Insatiate still, her beauty-loving eye.

" For Zophiël wore a mortal form; and blent
In mortal form, when perfect, Nature shows
Her all that's fair, enhanced: fire, firmament,
Ocean, earth, flowers, and gems—all there disclose

" Their charms epitomized; the heavenly power
To lavish beauty, in this last work, crowned:
And Egla, formed of fibres such as dower
Those who most feel, forgot all else around."

Egla, by pure virginal instinct, detects treachery in Zophiël's appeal, resists his powerful spell, and re-affirms her acceptance of Meles in obedience to her parents. Zophiël vanishes, and Meles enters:

" But ere he yet with haste could throw aside
His broidered belt and sandals—dread to tell—
Eager he sprang—he sought to clasp his bride—
He stopt—a groan was heard—he gasped, and fell

" Low by the couch of her who widowed lay,
Her ivory hands convulsive clasped in prayer,
But lacking power to move; and when 'twas day,
A cold black corse was all of Meles there."

Neither in the "Loves of the Angels" nor in "Lalla Rookh" does Thomas Moore's flowing measure equal the musical cadences of "Zophiël," and there is greater beauty of scene and bloom lavished on the single acacian bower where Zophiël wistfully watches over Egla's sleep than on the whole journey of the beautiful Lalla. In the Choric Song of Tennyson's "Lotos-Eaters" the mosaic detail of sensuous description, though as delicate, is not so thoughtful or so warm in feeling.

Sardius, the young King of Media, learning the manner of his favorite Meles's death, detains Egla in his palace in strict but kind restraint, which is jealously observed by Philomars; this character, limned in three verses, is one of the darkest and strongest pictures of the human fiend to be found in literature:

" Dark Philomars, strong in his country's cause,
But harder than his battle helm his heart;
Born while his father fought, and nurst in wars,
Pillage and fire his sports, to kill, his only art.

" And when he sacked a city, he could tear
The screaming infant from its mother's arms,
Dash it to earth, and while 'twas weltering there,
With demon grasp impress her shuddering charms;

" Then, as she faints with shrieks and struggles vain,
Coolly recall her with the ruffian blow;
And look and pause, insatiate of her pain,
Then gash her tender throat, and see the life-blood flow.

" O Nature! can it be? the thought alone
Chills the quick pulse: Belief retires afar;
Reason grows angry; Pity breathes a groan;
And each distrusts the truth: yet such things are."

Egla's dress, when sent for to "evening banquet" with King Sardius, is something more than a superb festal toilet; it is the artistic expression of her nature and situation, modestly yet consciously chosen by her to be such. In every scene, under every test, Egla's charm is one with her goodness, and every soul that is moved by her beauty is moved higher.

EGLA'S TOILET.

" With unassured yet graceful step advancing,
The light vermilion of her cheek more warm
For doubtful* modesty; while all were glancing
Over the strange attire that well became such form.

" To lend her space the admiring band gave way;
The sandals on her silvery feet were blue;
Of saffron tint her robe, as when young day
Spreads softly o'er the heav'ns and tints the trembling dew.

" Light was that robe as mist; and not a gem
Or ornament impedes its wavy fold,
Long and profuse, save that above its hem
'Twas broidered in pomegranate wreath in gold;

" And by a silken cincture, broad and blue,
In shapely guise about the waist confined;
Blent with the curls that, of a lighter hue,
Half floated, waving in their length behind;
The other half, in braided tresses twined,
Was decked with rose of pearls and sapphire's azure too,

" Arranged with curious skill to imitate
The sweet acacia's blossoms, just as live
And droop those tender flowers in natural state;
And so the trembling gems seemed sensitive,

" And, pendent, sometimes touch her neck, and there
Seem shrinking from its softness as alive;
And round her arms, flower-white and round and fair,
Slight bandelets were twined of colors five,

" Like little rainbows, seemly, on those arms.
None of that court had seen the like before—
Soft, fragrant, bright: so much like heaven her charms,
It scarce could seem idolatry to adore."

Byron and Swinburne have a language-magic something like this, but neither so infuses his description of woman's beauty with that intenser loveliness of the spirit which makes the body the breath and picture of the soul.

Altheëtor, a very beautiful youth of Sardius's court, of a nature pure and high as it was ardent, falls ill, pining secretly for Egla, and becomes another victim of Zophiël's jealous wrath.

In the third and fourth cantos, "Palace of the Gnomes," and "The Storm," we have a description of celestial and inframundane scenery and drama, and the spiritual proportions of Zophiël come into full relief.

ZOPHIËL TO THE FLOWER SPIRIT PHRAËRION.

" 'Conduct me to those hoards of sweets and dews,
Treasured in haunts to all but thee unknown,

* Doubting.

For favorite sprites; teach me their power and use,
And whatsoe'er thou wilt of Zophiël, be it done!
* * * * * * *
"'My Egla left in her acacia grove
Has learnt to lay aside that piteous fear
That sorrowed thee; and I but live to prove
A love for her as harmless as sincere.
* * * * * * *
"'And oft, when nature pants, and the thick air,
Charged with foul particles, weighs sluggish o'er,
I breathe them all; that deep disgust I bear
To leave a fluid pure and sane for her.
* * * * * * *
"'But the night wanes! while all is bright above,'
He said, and round Phraërion, nearer drawn,
One beauteous arm he flung. 'First to my love;
We'll see her safe; then to our task till dawn.'"

THE DESCENT OF ZOPHIËL AND PHRAËRION.

"The sea was calm, and the reflected moon
Still trembled on its surface; not a breath
Curled the broad mirror. Night had passed her noon.
How soft the air! How cold the depths beneath!

"The spirits hover o'er that surface smooth;
Zophiël's white arm around Phraërion's twined
In fond caress, his tender fears to soothe,
While either's nearer wing the other's crossed behind.

"Well pleased, Phraërion half forgot his dread,
And first, with foot as white as lotos leaf,
The sleepy surface of the waves essayed;
But then his smile of love gave place to drops of grief.

"How could he for that fluid dense and chill
Change the sweet floods of air they floated on?
E'en at a touch his shrinking fibres thrill;
But ardent Zophiël, panting, hurries on,

"And (catching his mild brother's tears with lip
That whispered courage 'twixt each glowing kiss)
Persuades to plunge. Limbs, wings, and locks they dip:
Whate'er the other's pains, the lover felt but bliss."

At the submarine palace of the gnome Tahathyam, Zophiël obtains a crystal spar, in which one drop of the elixir which perpetuates life is inclosed. With this between his lips, and his fragile guide Phraërion clasped to his breast, he sets out to return from the sea-deeps to the earth's surface. The most violent submarine storm engages all his supernatural powers, and the precious spar, for the possession of which so much has been endured, is dashed from his lips and whelmed in an ocean gulf, into whose vortex he may not plunge without remaining an eternity. The two storm-spent sprites emerge "near Lybia's coast," only to encounter a terrific earth storm, in whose relentless fury Zophiël perceives the malignant purpose of an evil spirit more powerful than himself. He lends all his strength and care to shelter the delicate Phraërion, but at last, in the storm's climax, both are dashed "prostrate on the sands."

THE SPIRITS' CONFLICT.

"But Zophiël, stung with shame, and in a mood
Too fierce for fear, uprose; yet ere for flight
Served his torn wings, a form before him stood
In gloomy majesty. Like starless night

"A sable mantle fell in cloudy fold
From its stupendous breast; and as it trod
The pale and lurid light, at distance rolled
Before its princely feet, receding on the sod.

"'Twas still as death, save that the thunder spoke
In mutterings low and far. A look severe
Seemed as preluding speech; but Zophiël broke
The silence first: 'Why, Spirit, art thou here?'

"It waved its hand, and instantaneous came
A hissing bolt with new impetus back;
Darts round a group of verdant palms the flame;
That, being pointed to them, blasted black.

"'O source of all my guilt! at such an hour'
(The mortal lover said) 'thine answer there
I need not read; too well I know thy power
In all I've felt and feel. But has despair,

"'Or grief, or torment, e'er made Zophiël bow?
Declare me that, nor spend thine arts in vain
To torture more. If, like a miscreant, now
I bend to thee, 'tis not for dread of pain;

"'That I can bear: yet, bid thy legions cease
Their strife. Oh, spare me this resistance rude
But for an hour! Let me but on in peace;
So shall I taste the joy of gratitude,

"'Even to thee!' 'The joy?' then first, with scorn,
Replied that sombre Being. 'Dream'st thou still
Of joy—a thing accurst, demeaned, forlorn,
As thou art? Is't for joy thou mock'st my will?

"'Canst thou taste pleasure, banished, crushed, debased?'
'I can, betrayer! Dost thou envy me?
But leave me to my wrongs, and I can taste
Even yet of heaven, spite of my fall and thee.

"'But that affects not thee. Thine insults spare
But for an hour; leave me to go at will
Only till morn, and I will back and bear
Whate'er thou wilt. What! dost obstruct me still?

"'Thine armies, dim and shrouded in the storm,
Then I must meet; and weary thus, and torn,
Essay the force of an immortal arm,
Lone as I am, until another morn.'

"Thus he. The other folded o'er its breast
Its arms, and stood as cold and firm the while
As if no passion stirred save that expressed
Its pale, pale lip—a faint, ferocious smile;

"While, blent with winds, ten thousand agents wage
Anew the strife; and Zophiël, fain to fly,
But foiled, gave up to unavailing rage,
And strove, and toiled, and strove, but could not mount on high."

Though there are glimpses of the "Inferno" in "Zophiël," the story does not lead through its scenes, yet the great likeness in kind and quality between the genius of the "melancholy Florentine" and that revealed in "Zophiël" could not escape the student of both poets. In scope and plot the "Inferno" and "Zophiël" are scarcely to be compared; there is too much unlikeness of attempt; but the soul-current vitalizing each of these poems is the warm and brilliant, passionate and profound, tide of a like inspiration. In the plot of "Zophiël" the stream flows necessarily between nearer banks, but proves its identity of source by the floating flower, the golden sand, the tint and depth and lustre that flow from no lesser springs.

In the tenth canto of the "Inferno" the discourse between Dante and "Farinata degli Uberti" and Cavalcanti, and the accessories of the situation, are in their dark sublimity wonderfully like the scene of recrim-

ination between Zophiël and the fiend in The Storm, though the likeness is in the power and feeling rather than in the situation.

In the fifth canto, entitled "Zameïa," the description of the temple and rites of Mylitta is identical in fact with the same related by Herodotus, Guignant, and others; but in the verse of "Zophiël" it is so refined of the commoner conceptions of such a rite, and is invested with so much seriousness and beauty as having an impersonal and simply sacrificial significance, that merely sensual appreciation must recoil chilled, as from the pure nakedness of a statue. The whole movement of this canto, its glow and form and finish, are as replete with beauty as the richest measures of Byron when Byron's impulse was—as it sometimes was—noble and pure, and it is wholly without the trail of reckless license that creeps through some of his fairest creations. The limpid flowing song of Mrs. Browning's "Swan's Nest among the Reeds" is recalled, not by any analogy of scope or *motif*, but the soft and vivid delicacy of feeling and expression is the same.

The yet unsubsided wave of what has gone before, and the imminence of the last crisis, are immediately felt in the first verses of "The Bridal of Helon" (the sixth and last canto), where occurs the ardent complaint which Southey quotes with such admiring delight in *The Doctor*.

Egla, in the soft twilight solitude of her acacia grove, muses as she tunes her lute, longing for Zophiël's presence:

"Softly heaving
The while her heart, thus from its inmost core
Such feelings gushed, to Lydian numbers weaving,
As never had her lip expressed before."

SONG OF EGLA.

"Day, in melting purple dying,
Blossoms, all around me sighing,
Fragrance, from the lilies straying,
Zephyr, with my ringlets playing,
Ye but waken my distress:
I am sick of loneliness.

"Thou to whom I love to hearken,
Come ere night around me darken.
Though thy softness but deceive me,
Say thou'rt true, and I'll believe thee;
Veil, if ill, thy soul's intent,
Let me think it innocent.

"Save thy toiling, spare thy treasure;
All I ask is friendship's pleasure.
Let the shining ore lie darkling,
Bring no gem in lustre sparkling:
Gifts and gold are naught to me,
I would only look on thee;

"Tell to thee the high-wrought feeling,
Ecstasy but in revealing;
Paint to thee the deep sensation,
Rapture in participation,
Yet but torture if comprest
In a lone, unfriended breast.

"Absent still? Ah, come and bless me!
Let these eyes again caress thee.
Once in caution I could fly thee,
Now I nothing could deny thee;
In a look if death there be,
Come! and I will gaze on thee!"

Southey declared this poem to be not only equal, but superior, to Sappho's famous "Ode to Aphrodite." There is in places a strange likeness of emotion and power in the two ardent adjurations. Here is the Sapphic Hymn as a New England poet-philosopher* gracefully translates it:

"Beautiful, throned, immortal Aphrodite!
Daughter of Zeus! beguiler, I implore thee
Weigh me not down with weariness and anguish,
O thou most holy!

"Come to me now! if ever thou in kindness
Hearkenedst my words—and often hast thou hearkened,
Heeding, and coming from the mansions golden
Of thy great Father,

"Yoking thy chariots, borne by thy most lovely
Consecrated birds, with dusky-tinted pinions,
Waving swift wings from utmost heights of heaven,
Through the mid ether:

"Swiftly they vanished, leaving thee, O goddess,
Smiling, with face immortal in its beauty,
Asking what I suffered, and why in utter longing
I had dared call thee;

"Asking what I sought thus hopeless in desiring,
'Wildered in brain, and spreading nets of passion,
Alas! for whom? and saidst thou, 'Who hast harmed thee,
O my poor Sappho?

"'Though now he flies, ere long he shall pursue;
Fearing thy gifts, he too in turn shall bring them;
Loveless to-day, to-morrow he shall woo thee,
Though thou shouldst spurn him.'"

"Thus seek me now, O holy Aphrodite!
Save me from anguish, give me all I wish for—
Gifts at thy hand; and thine shall be the glory,
Sacred protector!"

Thus Sappho, praying to love's source, while Egla entreats only a lover; yet Egla's song is tenderer music. Sappho desires gifts, her own happiness, and to be love-compelling; Egla seeks only permission to completely love and bless. Her passion and its prayer are diviner than Sappho's, and the song which breathes them is a more penetrating strain, reminding of the tender human woe of the foreboding Willow Song of Desdemona, and the lily maid of Astolat's Song of Love and Death.

A guardian spirit, perceiving the dangerous situation of Egla, hovers near her at the same moment that Zophiël, just returning from the fruitless subterranean journey and storm-conflict related in the third and fourth cantos, approaches her, listens in transport to the song, at whose close, with tender sighs, she breathes his name. At this moment, when Zophiël is about to reveal himself, Zameïa darts forward, and in the very attempt to kill Egla, falls dead.

Egla, forced to witness at her very feet Zameïa's passionate death, and weary of the long scene of horrors, of which she is the innocent cause, prepares to take her own life. Helon, her predestined bridegroom, frustrates her design. Their betrothal follows. Zophiël, while this transpires, is withheld

* T. W. Higginson.

in the wood in vain struggle with the "dark Being of the Storm," but escapes, and reaches Egla's bridal chamber only in time to be repelled by the "insufferable perfume fire" of the burning contents of the carneol box, given long ago to Helon, for the protection of this very hour, by Hariph, who hurls the wretched Zophiël away, and discloses himself to the bridal pair as the angel Raphael.

Raphael then seeks Zophiël, with wish and word of heavenly

PITY, CONSOLATION, AND HOPE.

"Hurl'd 'gainst his will, the suffering Zophiël went
To the remotest of Egyptia's bounds;
Demons pursued to view his punishment,
And with his shrieks the desert blast abounds.

"Dark shadowy fiends, invidious that he joy'd
In love and beauty still, less deeply curst
Than they, of late had leagued them, and employed
All arts to crush and foil. Now, as when first

"Expelled from heaven, they saw him writhe; and while
He groans and clasps the earth, sit them beside,
Ask questions of his bliss, and then with smile
Recount his baffled schemes, and linger to deride.

"And when they fled, he hid him in a cave,
Strewn with the bones of some sad wretch, who there,
Apart from man, had sought a desert grave,
And yielded to the demon of despair.

"There beauteous Zophiël shrinking from the ray,
Envying the wretch that so his life had ended,
Wailed his eternity. He fain would pray,
But could not pray to One he had offended.

"The fiercest pains of death had been relief,
And yet his quenchless being might not end.
Hark! Raphael's voice breaks sweetly on his grief:
'Hope, Zophiël! hope! hope! hope! thou hast a friend!'"

The reviews of this poem at the time of its appearance, both in England and America, did what seemed like a reluctant sort of justice. Though the ocean rolled between us and the mother country, and though by every principle of government, national hope, and endeavor, we were sharply divided from her, still our gods in literature had been and were her gods—Shakspeare, Spenser, and Milton. A country with a young civilization and a young literature, we did not expect and were not prepared to meet a revelation of American genius ranking with the great poets of the world. Even Mr. Griswold, the personal friend and admirer of Maria del Occidente, waited for the English verdict before speaking half his mind, and then spoke but the half.

The faults found in "Zophiël" were notably of that class which are blemishes or charms according to the mental temperament impressed. It was inevitably subjected to coarse as well as to noble interpretation; yet the least sympathetic appreciation acknowledged its greatness and distinctive originality, while a certain element peculiar to a past era in British criticism was curiously betrayed into an uncomfortable astonishment, a sort of blank and vexed amazement, that so majestic a strain could have risen in skies that did not immediately arch over Shakspeare's isle. "And all this," said the London *Quarterly*, in closing a short but keen tribute of admiration, "out of a coffee plantation in Cuba!"

Yet embarking solely upon its own merits, without herald and without propelling hand, this great poem, receiving but a brief salute, was suffered to pass, as a ship sets sail, into the mists of obscurity, and, fading from sight, to fade even from remembrance. But at last, let us hope, those mists are parted, and the waters of her native shores shall lap with waves of welcome and sweet loudening recognition the long-hidden bark.

From Maria del Occidente's miscellaneous poems we quote entire her

"ODE TO THE DEPARTED.

"'*Con Vista's del Cielo.*'

"The dearth is sore: the orange leaf is curled.
There's dust upon the marble o'er thy tomb,
My Edgar, fair and dear;
Though the fifth sorrowing year
Hath passed since first I knew thine early doom,
I see thee still, though Death thy being hence hath hurled.

"I could not bear my lot, now thou art gone—
With heart o'ersoftened by the many tears
Remorse and grief have drawn—
Save that a gleam, a dawn
(Haply of that which lights thee now), appears
To unveil a few fair scenes of Life's next coming morn.

"What, where, is heaven? earth's sweetest lips exclaim.
In all the holiest seers have writ or said,
Blurred are the pictures given.
We know not what is heaven,
Save by those views mysteriously spread
When the soul looks afar by light of her own flame.

"Yet all our spirits, while on earth so faint,
By glimpses dim discern, conceive, or know,
The Eternal Power can mould
Real as fruits or gold,
Bid the celestial roseate matter glow,
And forms more perfect smile than artists carve or paint.

"To realize every creed conceived
In mortal brain, by love and beauty charmed,
Even like the ivory maid
Who, as Pygmalion prayed,
Oped her white arms, to life and feeling warmed,
Would lightly task the power of life's great Chief believed.

"If Grecian Phidias in stone like this
Thy tomb could do so much, what can not He
Who from the cold, coarse clod
By reckless laborer trod
Can call such tints as meeting seraphs see,
And give them breath and warmth like true love's soul-felt kiss?

"Wild fears of dark annihilation, go!
Be warm, ye veins, now blackening with despair!
Years o'er thee have revolved,
My first-born; thou'rt dissolved—
All—every tint—save a few ringlets fair;
Still, if thou didst not live, how could I love thee so?

"Quick as the warmth which darts from breast to breast
When lovers from afar each other see,
Haply thy spirit went,
Where mine would fain be sent,
To take a heavenly form, designed to be
Meet dwelling for the soul thine azure eye expressed.

"Thy deep blue eye! Say, can heaven's bliss exceed
The joy of some brief moments tasted here?
Ah! could I taste again—
Is there a mode of pain
Which for such guerdon could be deemed severe?
Be ours the forms of heaven, and let me bend and
bleed!

"To be in place, even like some spots on earth,
In those sweet moments when no ill comes near;
Where perfumes round us wreathe,
And the pure air we breathe
Nerves and exhilarates; while all we hear
So tells content and love, we sigh and bless our
birth.

"To clasp thee, Edgar, in a fragrant shape
Of fair perfection, after death's sad hour,
Known as the same I've prest
Erst to this aching breast—
The same, but finished by a kind, bland Power,
Which only stopped thy heart to let thy soul
escape—

"Oh! every pain that vexed thy mortal life,
Nay, even the lives of all who round me lie,
Be this one bliss my share,
The whole condensed I'll bear,
Bless the benign creative hand, and sigh
And kneel to ask again the expiatory strife—

"Strife, for the hope of making others blest,
Who trespassed only that they were not brave
Enough to bear or take
Pains, even for pity's sake—
Strife, for the hope to wake, incite, and save,
Even those who, dull with crime, know not fair
Honor's zest.

"If, in the pauses of my agony
(Be it or flame, stab, scourge, or pestilence),
If, fresh and blest, as dear,
Thou'lt come in beauty near,
Speak, and with looks of love charm my keen
sense,
I'll deem it heaven enough even thus to feel and
see.

"To feel my hand wrenched as with mortal rack,
Then see it healed, and ta'en, and kindly prest,
And fair as blossoms white
Of cerea in the night,
While tears that fall upon thy spotless breast
Are sweet as drops from flowers touched in thy
heavenly track!

"In form to bear nor stain nor scar designed—
Yes! let me kneel to agonize again;
Ask every torment o'er
More poignant than before.
Of a whole world the price of a whole pain
Were small, for such blest gifts of matter and of
mind!

"Comes a cold doubt— That still thou art alive,
Edgar, my heart tells while these numbers thrill;
Yet of a bliss so dear,
And as Death's portal's near,
I feel me too unworthy: dreary Time,
I fear, must bear his part ere Hope her plight
fulfill!

"Time, time was meet (so many a sacred scroll
Has told and tells) ere light was bid to smile;
Ere yet the spheres, revealed,
Gave music as they wheeled;
Warm, rife, eternal love—a time—a while—
Brooded and charmed and ranged till chaos gloomed
no more.

"As time was needful ere a world could bloom
With forms of flowers and flesh, haply must wait
Some spirits; and lingering still,
Of deeds both good and ill
Mark the effect in intermediate state,
And think, and pause, and weep, even over their
own tomb.

"Be it so: if thin as fragrance, light, or heat,
Thine essence, floating on the ambient air,
Can, with freed intellect,
View every deed's effect,
Read even my heart, in all its pantings bare:
When denser pulses cease, how sweet even thus
to meet!

"To roam those deep green aisles, crowned with tall
palms,
And weep for all who tire of toil and ill,
While moons of winter bring
Their blossoms fair as spring,
To move, unseen by all we've left, and will
Such influence to their souls as half their pain
becalms;

"On deep Mohecan's* mounts to view the spot
Where, as these arms were oped to clasp thee,
came
The tidings, dread and cold,
I never more might hold
Thy pulsing form, nor meet the gentle flame
Of thy fair eyes till mine for those of earth were
not;

"On precipice where the gray citadel
Hangs over Ladaüanna's† billows clear,
How sweet to pause and view,
As erst, the far canoe;
To glide by friends who know not we are near,
And hear them of ourselves in tender memory tell;

"Or where Niagara with maddening roar
Shakes the worn cliff, haply to flit, and ken
Some angel, as he sighs
With pleasure at the dyes
Of the wild depth, while to the eyes of men
Invisible, we speak by signs unknown before;

"Or, far from this wild Western world, where dwelt
That brow whose laurels bore a leaf for mine,
When, strong in sympathy,
Thy sprite shall roam with me,
Edgar, 'mid Derwent's flowers, one soul benign
May to thy soul impart the joy I there have felt!

"What though 'imprisoned in the viewless winds,'
'Mid storms and rocks, like earthly ship, were
dashed,
Unsevered while we're blent,
We'll bear in sweet content
The shock of falling bolt or forest crashed,
While thoughts of hope and love nerve well our
mystic minds.

"Wafted or wandering thus, souls may be found
Or ripe for forms of heaven, or for that state
Of which, when angels think,
Or saints, they weep and shrink,
And oft, to draw or save from such dread fate,
Are fain their beauteous heads to dash 'gainst
blood-stained ground.

"Freed from their earthly gyves, if spirits laugh
And shriek with horrid joy when victims bleed
Or suffer, as we view
Mortals in vileness do,
The Eternal and His court may keep their meed
Of joy: far other cups fell thirsty Guilt must quaff!

"O Edgar! spirit or on earth or air,
Seen or impalpable to artist's sketch,
In essence or in form,
In bliss, pain, calm, or storm,
Let us, wherever met a suffering wretch,
Task every power to shield and save him from
despair!

"Nature hath secrets mortals ne'er suspect:
At some we glance, while some are sealed in
night.
The optician, by his skill,
Even now can show, at will,

* "Mohecan," aboriginal name of the Hudson.
† "Ladaüanna," aboriginal name of the St. Lawrence.

Long absent spheres, in shapes of moving light:
If man so much can do, what can not Heaven effect!

"Shade, image, manes, all the ancient priest
Told to his votarists in fraud or zeal,
May be, and might have been
By means and arts we ween
No more of, in this age: for woe or weal
Of man, full much 'fore known, to this late race
hath ceased.

"That souls may take ambrosial forms in heaven,
A dawning science half assures the hope:
These forms may sleep and smile
Midst heaven's fresh roses, while
Their spirits, free, roam o'er this world's whole
scope
For pleasure and for good, Heaven's full permission
given.

"I have not sung of meeting those we've loved,
Or known, and listening to their accents meek,
While pitying all they've pained
On earth, while passion reigned:
To wreak redress upon themselves they seek,
And bless, for each stern deed, the pain they now
have proved.

"I have not sung of the first, fairest court;
Of all those mansions; of the heavenly home,
Of which the best hath told
Who e'er trod earthly mould:
To courts of earthly kings the fairest come,
Haply to show faint types of this supreme resort!

"Haply the Sire of sires may take a form
And give an audience to each set unfurled
With bands of sympathy,
Wreathen in mystery,
Round those who've known each other in this
world,
Perfecting all the rest, and breathing beauty warm.

"Essence, light, heat, form, throbbing arteries—
To deem each possible, enough I see!
Edgar, thou knowest I wait:
Guard my expectant state;
Console me, as I bend in prayers for thee;
Aid me, even as thou mayest, both Heaven and thee
to please!

"This song to thee alone! though he who shares
Thy bed of stone shared well my love with thee;
Yet in his noble heart
Another bore a part,
Whilst thou hadst never other love than me.
Sprites, brothers, manes, shades, present my tears
and prayers!"

Mr. Griswold says, in his *Female Poets of America* (1853), that the above peculiar stanza was invented by Maria del Occidente.

In speaking of Zophiël, Mr. Griswold says, "Zophiël seems to us the finest fallen angel that has come to us from the hand of a poet. Milton's outcasts from heaven are utterly depraved and abraded of their glory, but Zophiël has traces of his original virtue and beauty, and a lingering hope of restoration to the presence of the Divinity." He adds: "There were at the time of the publication of 'Zophiël' in Boston (1834) too few readers among us of sufficiently cultivated and independent taste to appreciate a work of art which time or accident had not commended to the popular applause. At the end of a month only about twenty copies had been sold, and in a moment of disappointment Mrs. Brooks caused the remainder of the impression to be withdrawn from the market. The poem has, therefore, been very little read in this country, and even the title of it would have remained unknown to the common reader of elegant literature but for occasional allusions to it by Southey and other foreign critics."

Being desirous of having a full edition of her works, including *Idomen*, published, Mrs. Brooks authorized Mr. Griswold to "offer gratuitously her copyrights to an eminent publishing house for that purpose. In the existing condition of the copyright laws, which should have been entitled Acts for the Discouragement of a Native Literature, she was not surprised that the offer was declined, though indignant that the reason assigned should have been that they were 'of too elevated a character to sell.'"

Writing to Mr. Griswold soon afterward, she observed: "I do not think any thing from my humble imagination can be *too elevated*, or elevated enough, for the public as it really is in these North American States.....In the words of poor Spurzheim (uttered to me a short time before his death in Boston), I solace myself by saying, 'Stupidity! stupidity! the knowledge of that alone has saved me from misanthropy.'"

In 1844, about a year before her death, she wrote to Mr. Griswold: "When I have written out my 'Vistas del Infierno' and one other short poem, I hope to begin the penning of the epic of which I have so often spoken to you ('Beatriz, the Beloved of Columbus'), but when or whether it will be finished, Heaven alone can tell."

In allusion to this letter, Mr. Griswold says, "I have not learned whether this poem was written, but when I heard her repeat passages of it I thought it would be a nobler work than 'Zophiël.'"

The authoress of "Zophiël" wrote one prose tale, *Idomen; or, the Vale of Yumuri.* Its scenery is tropical and Cuban—a glowing bit of tapestry upon which the action is wrought in rich but sombre tints.

It is undoubtedly autobiographical, and in some sense a confession, and in this light can not be read but with the deepest sympathy and reverent interest. The same great capacity for intense, passionate devotion of love which animates her verse is revealed in this little heart history, and there is the same evidence of a grandly endowed nature undergoing almost complete spiritual deprivation in a totally uncongenial companionship. Three times Idomen attempts escape by suicide; there is none of the cowardice or small motive of death-seeking—it is clearly the highest courage of despair, looking undismayed upon possible vague horrors greater than mark its mortal condition, but irresistibly bent on changing at least the situation of its woe.

Idomen's lot is pierced by some gleams of joy, and she enjoys one perfect day:

"Has any one lived a life without tasting

a single day of happiness—happiness in accordance with the pantings of the heart which feels it—happiness, for the time, so large as to leave no room for wishes? One day at least of such happiness has been mine. One day! a single point between two masses of dullness and solicitude, made sufferable by a few pleasures, often uncheered with hope, and sometimes blackened by despair."

The love-deprived Idomen can say of this highest attribute: "The bliss of the Deity is to love. Those who have known what is love in perfection, though on earth and but for a moment, need not ask what reward awaits the just."

And again, with the divine courage that thrills only in the greatest souls: "I would not give the scenes passed with Ethelwald, with all their pain of more than many deaths, for a whole life of calm happiness."

As a psychological study, and as a work of art, *Idomen* has a beauty and separateness such as attach to Allston's *Monaldi*, to Moore's *Epicurean*, to the *Atala* of Châteaubriand; or to *Vathek*, the *Sorrows of Werther*, and *Paul and Virginia*.

Mr. Griswold, who was her personal friend, and probably knew her private history, declares: "*Idomen* contains little that is fictitious except the names of the characters. The account which *Idomen* gives of her own history is *literally true*, except in relation to an excursion to Niagara, which occurred, but in a different period of the author's life. *Idomen* will possess an interest and value as a psychological study independent of that which belongs to it as a *record of the experience* of so eminent a poet."

As an American woman, myself of a humble order of the quill, I feel a serious satisfaction, deep and sweet, in laying this little scroll upon the grave of my great countrywoman.

MACLEOD OF DARE.

CHAPTER XLIV.

THE PRISONER.

THE sudden noise overhead and the hurried trampling of the men on deck were startling enough; but surely there was nothing to alarm her in the calm and serious face of this man who stood before her. He did not advance to her. He regarded her with a sad tenderness, as if he were looking at one far away. When the beloved dead come back to us in the wonder-halls of sleep, there is no wild joy of meeting: there is something strange. And when they disappear again, there is no surprise: only the dull aching returns to the heart.

"Gertrude," said he, "you are as safe here as ever you were in your mother's arms. No one will harm you."

"What is it? What do you mean?" said she, quickly.

She was somewhat bewildered. She had not expected to meet him thus suddenly face to face. And then she became aware that the companionway by which she had descended into the saloon had grown dark: that was the meaning of the harsh noise.

"I want to go ashore, Keith," said she, hurriedly. "Put me on shore. I will speak to you there."

"You can not go ashore," said he, calmly.

"I don't know what you mean," said she; and her heart began to beat hurriedly. "I tell you I want to go ashore, Keith. I will speak to you there."

"You can not go ashore, Gertrude," he repeated. "We have already left Erith. . . . Gerty, Gerty," he continued, for she was struck dumb with a sudden terror, "don't you understand now? I have stolen you away from yourself. There was but the one thing left: the one way of saving you. And you will forgive me, Gerty, when you understand it all—"

She was gradually recovering from her terror. She did understand it now. And he was not ill at all?

"Oh, you coward!—you coward!—you coward!" she exclaimed, with a blaze of fury in her eyes. "And I was to confer a kindness on you—a last kindness! But you dare not do this thing!—I tell you, you dare not do it! I demand to be put on shore at once! Do you hear me?"

She turned wildly round, as if to seek for some way of escape. The door in the ladies' cabin stood open; the daylight was streaming down into that cheerful little place; there were some flowers on the dressing-table. But the way by which she had descended was barred over and dark.

She faced him again, and her eyes were full of fierce indignation and anger; she drew herself up to her full height; she overwhelmed him with taunts and reproaches and scorn. That was a splendid piece of acting, seeing that it had never been rehearsed. He stood unmoved before all this theatrical rage.

"Oh yes, you were proud of your name," she was saying, with bitter emphasis; "and I thought you belonged to a race of gentlemen, to whom lying was unknown. And you were no longer murderous and revengeful; but you can take your revenge on a woman, for all that! And you ask me to come and see you, because you are ill! And you have laid a trap, like a coward!"

"And if I am what you say, Gerty," said he, quite gently, "it is the love of you

that has made me that. Oh, you do not know!"

She saw nothing of the lines that pain had written on this man's face; she recognized nothing of the very majesty of grief in the hopeless eyes. He was only her jailer, her enemy.

"Of course—of course," said she. "It is the woman—it is always the woman who is in fault! That is a manly thing, to put the blame on the woman! And it is a manly thing to take your revenge on a woman! I thought when a man had a rival, that it was his rival whom he sought out. But you—you kept out of the way—"

He strode forward, and caught her by the wrist. There was a look in his face that for a second terrified her into silence.

"Gerty," said he, "I warn you! Do not mention that man to me—now or at any time; or it will be bad for him and for you!"

She twisted her hand from his grasp.

"How dare you come near me!" she cried.

"I beg your pardon," said he, with an instant return to his former grave gentleness of manner. "I wish to let you know how you are situated, if you will let me, Gerty. I don't wish to justify what I have done, for you would not hear me—just yet. But this I must tell you, that I don't wish to force myself on your society. You will do as you please. There is your cabin; you have occupied it before. If you would like to have this saloon, you can have that too: I mean I shall not come into it unless it pleases you. And there is a bell in your cabin; and if you ring it, Christina will answer."

She heard him out patiently; her reply was a scornful—perhaps nervous—laugh.

"Why, this is mere folly!" she exclaimed. "It is simple madness. I begin to believe that you are really ill, after all; and it is your mind that is affected. Surely you don't know what you are doing?"

"You are angry, Gerty," said he.

But the first blaze of her wrath and indignation had passed away; and now fear was coming uppermost.

"Surely, Keith, you can not be dreaming of such a mad thing! Oh, it is impossible! It is a joke: it was to frighten me: it was to punish me, perhaps. Well, I have deserved it; but now—now you have succeeded; and you will let me go ashore, further down the river."

Her tone was altered. She had been watching his face.

"Oh no, Gerty, oh no," he said. "Do you not understand yet? You were every thing in the world to me—you were life itself. Without you I had nothing, and the world might just as well come to an end for me. And when I thought you were going away from me, what could I do? I could not reach you by letters, and letters; and how could I know what the people around you were saying to you? Ah, you do not know what I have suffered, Gerty; and always I was saying to myself that if I could get you away from these people, you would remember the time that you gave me the red rose, and all those beautiful days would come back again, and I would take your hand again, and I would forget altogether about the terrible nights when I saw you beside me and heard you laugh just as in the old times. And I knew there was only the one way left. How could I but try that? I knew you would be angry, but I hoped your anger would go away. And now you are angry, Gerty, and my speaking to you is not of much use—as yet; but I can wait until I see you yourself again, as you used to be, in the garden—don't you remember, Gerty?"

Her face was proud, cold, implacable.

"Do I understand you aright—that you have shut me up in this yacht and mean to take me away?"

"Gerty, I have saved you from yourself!"

"Will you be so kind as to tell me where we are going?"

"Why not away back to the Highlands, Gerty?" said he, eagerly. "And then some day when your heart relents, and you forgive me, you will put your hand in mine, and we will walk up the road to Castle Dare. Do you not think they will be glad to see us that day, Gerty?"

She maintained her proud attitude, but she was trembling from head to foot.

"Do you mean to say that until I consent to be your wife I am not to be allowed to leave this yacht?"

"You will consent, Gerty!"

"Not if I were to be shut up here for a thousand years!" she exclaimed, with another burst of passion. "Oh, you will pay for this dearly! I thought it was madness—mere folly; but if it is true, you will rue this day! Do you think we are savages here?—do you think we have no law?"

"I do not care for any law," said he, simply. "I can only think of the one thing in the world. If I have not your love, Gerty, what else can I care about?"

"My love!" she exclaimed. "And this is the way to earn it, truly! My love! If you were to keep me shut up for a thousand years, you would never have it! You can have my hatred, if you like, and plenty of it, too!"

"You are angry, Gerty!" was all he said.

"Oh, you do not know with whom you have to deal!" she continued, with the same bitter emphasis. "You terrified me with stories of butchery—the butchery of innocent women and children; and no doubt you thought the stories were fine; and now you too would show you are one of the race by taking revenge on a woman. But if she is only a woman, you have not conquered

her yet! Oh, you will find out before long that we have law in this country, and that it is not to be outraged with impunity. You think you can do as you like; because you are a Highland master, and you have a lot of slaves round you!"

"I am going on deck now, Gerty," said he, in the same sad and gentle way. "You are tiring yourself. Shall I send Christina to you?"

For an instant she looked bewildered, as if she had not till now comprehended what was going on; and she said, quite wildly:

"Oh, no, no, no, Keith; you don't mean what you say! You can not mean it! You are only frightening me! You will put me ashore, and not a word shall pass my lips. We can not be far down the river, Keith. There are many places where you could put me ashore; and I could get back to London by rail. They won't know I have ever seen you. Keith, you will put me ashore now!"

"And if I were to put you ashore now, you would go away, Gerty, and I should never see you again—never, and never. And what would that be for you and for me, Gerty? But now you are here, no one can poison your mind; you will be angry for a time; but the brighter days are coming—oh yes, I know that: if I was not sure of that, what would become of me? It is a good thing to have hope; to look forward to the glad days: that stills the pain at the heart. And now we two are together at last, Gerty!—and if you are angry, the anger will pass away; and we will go forward together to the glad days."

She was listening in a sort of vague and stunned amazement. Both her anger and her fear were slowly yielding to the bewilderment of the fact that she was really setting out on a voyage, the end of which neither she nor any one living could know.

"Ah, Gerty," said he, regarding her with a strange wistfulness in the sad eyes, "you do not know what it is to me to see you again. I have seen you many a time—in dreams; but you were always far away; and I could not take your hand. And I said to myself that you were not cruel; that you did not wish any one to suffer pain; and I knew if I could only see you again, and take you away from these people, then your heart would be gentle, and you would think of the time when you gave me the red rose, and we went out in the garden, and all the air round us was so full of gladness that we did not speak at all. Oh yes; and I said to myself that your true friends were in the north; and what would the men at Dubh Artach not do for you, and Captain Macallum too, when they knew you were coming to live at Dare; and I was thinking that would be a grand day when you came to live among us; and there would be dancing, and a good glass of whiskey for every one, and some playing on the pipes that day! And sometimes I did not know whether there would be more of laughing or of crying when Janet came to meet you. But I will not trouble you any more now, Gerty; for you are tired, I think; and I will send Christina to you. And you will soon think that I was not cruel to you when I took you away and saved you from yourself."

She did not answer; she seemed in a sort of trance. But she was aroused by the entrance of Christina, who came in directly after Macleod left. Miss White stared at this tall, thin-featured, white-haired woman, as if uncertain how to address her; when she spoke it was in a friendly and persuasive way.

"You have not forgotten me, then, Christina?"

"No, mem," said the grave Highland-woman. She had beautiful, clear, blue-gray eyes, but there was no pity in them.

"I suppose you have no part in this mad freak?"

The old woman seemed puzzled. She said, with a sort of serious politeness:

"I do not know, mem. I have not the good English as Hamish."

"But surely you know this," said Miss Gertrude White, with more animation, "that I am here against my will? You understand that, surely? That I am being carried away against my will from my own home and my friends? You know it very well; but perhaps your master has not told you of the risk you run? Do you know what that is? Do you think there are no laws in this country?"

"Sir Keith he is the master of the boat," said Christina. "Iss there any thing now that I can do for you, mem?"

"Yes," said Miss White, boldly. "There is. You can help me to get ashore. And you will save your master from being looked on as a madman. And you will save yourselves from being hanged."

"I wass to ask you," said the old Highland-woman, "when you would be for having the dinner. And Hamish, he wass saying that you will hef the dinner what time you are thinking of; and will you hef the dinner all by yourself?"

"I tell you this, woman," said Miss White, with quick anger, "that I will neither eat nor drink so long as I am on board this yacht! What is the use of this nonsense? I wish to be put on shore. I am getting tired of this folly. I tell you I want to go ashore; and I am going ashore; and it will be the worse for any one who tries to stop me!"

"I do not think you can go ashore, mem," Christina said, somewhat deliberately picking out her English phrases, "for the gig is up at the davits now; and the dingey—you wass not thinking of going ashore by your-

self in the dingey? And last night, mem, at a town, we had many things brought on board; and if you would tell me what you will hef for the dinner, there is no one more willing than me. And I hope you will hef very good comfort on board the yacht."

"I can't get it into your head that you are talking nonsense!" said Miss White, angrily. "I tell you I will not go any where in this yacht! And what is the use of talking to me about dinner? I tell you I will neither eat nor drink while I am on board this yacht."

"I think that would be a ferry foolish thing, mem," Christina said, humbly enough; but all the same the scornful fashion in which this young lady had addressed her had stirred a little of the Highland-woman's blood; and she added—still with great apparent humility—"But if you will not eat, they say that iss a ferry good thing for the pride; and there iss not much pride left if one hass nothing to eat, mem."

"I presume that is to be my prison?" said Miss White, haughtily, turning to the smart little state-room beyond the companion.

"That iss your cabin, mem, if you please, mem," said Christina, who had been instructed in English politeness by her husband.

"Well, now, can you understand this? Go to Sir Keith Macleod, and tell him that I have shut myself up in that cabin; and that I will speak not a word to any one; and I will neither eat nor drink, until I am taken on shore. And so, if he wishes to have a murder on his hands, very well! Do you understand that?"

"I will say that to Sir Keith," Christina answered, submissively.

Miss White walked into the cabin, and locked herself in. It was an apartment with which she was familiar; but where had they got the white heather? And there were books; but she paid little heed. They would discover they had not broken her spirit yet.

On either side the sky-light overhead was open an inch; and it was nearer to the tiller than the sky-light of the saloon. In the absolute stillness of this summer day she heard two men talking. Generally, they spoke in the Gaelic, which was of course unintelligible to her; but sometimes they wandered into English—especially if the name of some English town cropped up—and thus she got hints as to the whereabouts of the *Umpire*.

"Oh yes, it is a fine big town that town of Gravesend, to be sure, Hamish," said the one voice, "and I have no doubt, now, that it will be sending a gentleman to the Houses of Parliament in London, just as Greenock will do. But there is no one you will send from Mull. They do not know much about Mull in the Houses of Parliament!"

"And they know plenty about ferry much worse places," said Hamish, proudly. "And wass you saying there will be any thing so beautiful about Greenock ass you will find at Tobbermorry?"

"Tobermory!" said the other. "There are some trees at Tobermory—oh yes; and the Mish-nish, and the shops—"

"Yess, and the water-fahl—do not forget the water-fahl, Colin; and there iss better whiskey in Tobbermorry ass you will get in all Greenock, where they will be for mixing it with prandy and other drinks like that; and at Tobbermorry you will hef a professor come ahl the way from Edinburgh and from Oban to gif a lecture on the Gaelic; but do you think he would gif a lecture in a town like Greenock? Oh no; he would not do that!"

"Very well, Hamish; but it is glad I am that we are going back the way we came."

"And me too, Colin."

"And I will not be sorry when I am in Greenock once more."

"But you will come with us first of all to Castle Dare, Colin," was the reply. "And I know that Lady Macleod herself will be for shaking hands with you, and thanking you that you wass tek the care of the yacht."

"I think I will stop at Greenock, Hamish. You know you can take her well on from Greenock. And will you go round the Mull, Hamish, or through the Crinan, do you think now?"

"Oh, I am not afrait to tek her round the Moil; but there iss the English lady on board; and it will be smoother for her to go through the Crinan. And it iss ferry glad I will be, Colin, to see Ardalanish Point again; for I would rather be going through the Doruis Mohr twenty times ass getting petween the panks of this tamned river."

Here they relapsed into their native tongue, and she listened no longer; but at all events she had learned that they were going away to the north. And as her nerves had been somewhat shaken, she began to ask herself what further thing this madman might not do. The old stories he had told her came back with a marvellous distinctness. Would he plunge her into a dungeon, and mock her with an empty cup when she was dying of thirst? Would he chain her to a rock at low water and watch the tide slowly rise? He professed great gentleness and love for her; but if the savage nature had broken out at last? Her fear grew apace. He had shown himself regardless of every thing on earth: where would he stop, if she continued to repel him? And then the thought of her situation—alone; shut up in this small room; about to venture forth on the open sea with this ignorant crew—so overcame her that she hastily snatched at the bell on the dressing-table, and rang it violently. Almost instantly there was a tapping at the door.

"I ask your pardon, mem," she heard Christina say.

She sprang to the door, and opened it, and caught the arm of the old woman.

"Christina, Christina," she said, almost wildly, "you won't let them take me away! My father will give you hundreds and hundreds of pounds if only you get me ashore. Just think of him—he is an old man—if you had a daughter—"

Miss White was acting very well indeed; though she was more concerned about herself than her father.

"I wass to say to you," Christina explained, with some difficulty, "that if you wass saying that, Sir Keith had a message sent away to your father, and you wass not to think any more about that. And now, mem, I can not tek you ashore; it iss no business I hef with that; and I could not go ashore myself whateffer; but I would get you some dinner, mem."

"Then I suppose you don't understand the English language!" Miss White exclaimed, angrily. "I tell you I will neither eat nor drink so long as I am on board this yacht! Go and tell Sir Keith Macleod what I have said."

So Miss White was left alone again; and the slow time passed; and she heard the murmured conversation of the men, and also a measured pacing to and fro, which she took to be the step of Macleod. Quick rushes of feeling went through her—indignation; a stubborn obstinacy; a wonder over the audacity of this thing; malevolent hatred even; but all these were being gradually subdued by the dominant claim of hunger. Miss White had acted the part of many heroines; but she was not herself a heroine—if there is any thing heroic in starvation. It was growing to dusk when she again summoned the old Highland-woman.

"Get me something to eat," said she; "I can not die like a rat in a hole."

"Yes, mem," said Christina, in the most matter-of-fact way; for she had never been in a theatre in her life, and she had not imagined that Miss White's threat meant any thing at all. "The dinner is just ready now, mem; and if you will hef it in the saloon, there will be no one there; that wass Sir Keith's message to you."

"I will not have it in the saloon; I will have it here."

"Ferry well, mem," Christina said, submissively. "But you will go into the saloon, mem, when I will mek the bed for you, and the lamp will hef to be lit, but Hamish he will light the lamp for you. And are there any other things you wass thinking of that you would like, mem?"

"No; I want something to eat."

"And Hamish, mem, he wass saying I will ask you whether you will hef the claret-wine, or—or—the other wine, mem, that meks a noise—"

"Bring me some water. But the whole of you will pay dearly for this!"

"I ask your pardon, mem?" said Christina, with great respect.

"Oh, go away, and get me something to eat!"

And in fact Miss White made a very good dinner, though the things had to be placed before her on her dressing-table. And her rage and indignation did not prevent her having, after all, a glass or two of the claret-wine. And then she permitted Hamish to come in and light the swinging lamp; and thereafter Christina made up one of the two narrow beds. Miss White was left alone.

Many a hundred times had she been placed in great peril—on the stage; and she knew that on such occasions it had been her duty to clasp her hand on her forehead and set to work to find out how to extricate herself. Well, on this occasion she did not make use of any dramatic gesture; but she turned out the lamp, and threw herself on the top of this narrow little bed; and was determined that, before they got her conveyed to their savage home in the north, she would make one more effort for her freedom. Then she heard the man at the helm begin to hum to himself "Fhir a bhata, na horo eile." The night darkened. And soon all the wild emotions of the day were forgotten; for she was asleep.

* * * * * *

Asleep—in the very waters through which she had sailed with her lover on the white summer day. But *Rose Leaf! Rose Leaf! what faint wind will carry you* NOW *to the south?*

CHAPTER XLV.

THE VOYAGE OVER.

AND now the brave old *Umpire* is nearing her northern home once more; and surely this is a right royal evening for the reception of her. What although the sun has just gone down, and the sea around them become a plain of heaving and wrestling blue-black waves? Far away, in that purple-black sea, lie long promontories that are of a still pale rose-color; and the western sky is a blaze of golden green; and they know that the wild, beautiful radiance is still touching the wan walls of Castle Dare. And there is Ardalanish Point; and that the ruddy Ross of Mull; and there will be a good tide in the Sound of Iona. Why, then, do they linger, and keep the old *Umpire* with her sails flapping idly in the wind?

"As you pass through Jura's Sound,
Bend your course by Scarba's shore;
Shun, O shun, the gulf profound
Where Corrievreckan's surges roar!"

They are in no danger of Corrievreckan now; they are in familiar waters; only that is another Colonsay that lies away there in the south. Keith Macleod, seated up at the bow, is calmly regarding it. He is quite alone. There is no sound around him but the lapping of the waves.

"And ever as the year returns,
The charm-bound sailors know the day;
For sadly still the Mermaid mourns
The lovely chief of Colonsay."

And is he listening now for the wild sound of her singing? Or is he thinking of the brave Macphail who went back after seven long months of absence, and found the maid of Colonsay still true to him? The ruby ring she had given him had never paled. There was one woman who could remain true to her absent lover.

Hamish came forward.

"Will we go on now, Sir?" said he, in the Gaelic.

"No."

Hamish looked round. The shining clear evening looked very calm, notwithstanding the tossing of the blue-black waves. And it seemed wasteful to the old sailor to keep the yacht lying to or aimlessly sailing this way and that while this favorable wind remained to them.

"I am not sure that the breeze will last, Sir Keith."

"Are you sure of any thing, Hamish?" Macleod said, quite absently. "Well, there is one thing we can all make sure of. But I have told you, Hamish, I am not going up the Sound of Iona in daylight: why, there is not a man in all the islands who would not know of our coming by to-morrow morning. We will go up the Sound as soon as it is dark. It is a new moon to-night; and I think we can go without lights, Hamish."

"The *Dunara* is coming south to-night, Sir Keith," the old man said.

"Why, Hamish, you seem to have lost all your courage as soon as you put Colin Laing ashore."

"Colin Laing! Is it Colin Laing!" exclaimed Hamish, indignantly. "I will know how to sail this yacht, and I will know the banks, and the tides, and the rocks, better than any fifteen thousands of Colin Laings!"

"And what if the *Dunara* is coming south? If she can not see us, we can see her."

But whether it was that Colin Laing had before leaving the yacht managed to convey to Hamish some notion of the risk he was running, or whether it was that he was merely anxious for his master's safety, it was clear that Hamish was far from satisfied. He opened and shut his big clasp-knife in an awkward silence. Then he said:

"You will not go to Castle Dare, Sir Keith?"

Macleod started; he had forgotten that Hamish was there.

"No. I have told you where I am going."

"But there is not any good anchorage at that island, Sir!" he protested. "Have I not been round every bay of it; and you too, Sir Keith? and you know there is not an inch of sand or of mud, but only the small loose stones. And then the shepherd they left there all by himself; it was mad he became at last, and took his own life too."

"Well, do you expect to see his ghost?" Macleod said. "Come, Hamish, you have lost your nerve in the south. Surely you are not afraid of being any where in the old yacht so long as she has good sea-room around her?"

"And if you are not wishing to go up the Sound of Iona in the daylight, Sir Keith," Hamish said, still clinging to the point, "we could bear a little to the south, and go round the outside of Iona."

"The Dubh Artach men would recognize the *Umpire* at once," Macleod said, abruptly; and then he suggested to Hamish that he should get a little more way on the yacht, so that she might be a trifle steadier when Christina carried the dinner into the English lady's cabin. But indeed there was now little breeze of any kind. Hamish's fears of a dead calm were likely to prove true.

Meanwhile another conversation had been going forward in the small cabin below, that was now suffused by a strange warm light reflected from the evening sky. Miss White was looking very well now, after her long sea-voyage. During their first few hours in blue water she had been very ill indeed; and she repeatedly called on Christina to allow her to die. The old Highland-woman came to the conclusion that English ladies were rather childish in their ways; but the only answer she made to this reiterated prayer was to make Miss White as comfortable as was possible, and to administer such restoratives as she thought desirable. At length, when recovery and a sound appetite set in, the patient began to show a great friendship for Christina. There was no longer any theatrical warning of the awful fate in store for every body connected with this enterprise. She tried rather to enlist the old woman's sympathies on her behalf, and if she did not very well succeed in that direction, at least she remained on friendly terms with Christina, and received from her the solace of much gossip about the whereabouts and possible destination of the ship.

And on this evening Christina had an important piece of news.

"Where have we got to now, Christina?" said Miss White, quite cheerfully, when the old woman entered.

"Oh yes, mem, we will still be off the Mull shore, but a good piece away from it, and there is not much wind, mem. But Hamish thinks we will get to the anchorage the night whatever."

"The anchorage!" Miss White exclaimed, eagerly. "Where? You are going to Castle Dare, surely?"

"No, mem, I think not," said Christina. "I think it is an island—but you will not know the name of that island—there is no English for it at all."

"But where is it? Is it near Castle Dare?"

"Oh no, mem; it is a good way from Castle Dare; and it is out in the sea. Do you know Gometra, mem?—wass you ever going out to Gometra?"

"Yes, of course; I remember something about it, anyway."

"Ah, well, it is away out past Gometra, mem; and not a good place for an anchorage whatever; but Hamish he will know all the anchorages."

"What on earth is the use of going there?"

"I do not know, mem."

"Is Sir Keith going to keep me on board this boat forever?"

"I do not know, mem."

Christina had to leave the cabin just then; when she returned she said, with some little hesitation:

"If I wass mekking so bold, mem, ass to say this to you: Why are you not asking the questions of Sir Keith himself? He will know all about it; and if you were to come into the saloon, mem—"

"Do you think I would enter into any communication with him after his treatment of me?" said Miss White, indignantly. "No; let him atone for that first. When he has set me at liberty, then I will speak with him; but never so long as he keeps me shut up like a convict."

"I wass only saying, mem," Christina answered, with great respect, "that if you were wishing to know where we were going, Sir Keith will know that; but how can I know it? And you know, mem, Sir Keith has not shut you up in this cabin: you hef the saloon, if you would please to hef it."

"Thank you, I know!" rejoined Miss White. "If I choose, my jail may consist of two rooms instead of one. I don't appreciate that amount of liberty. I want to be set ashore."

"That I hef nothing to do with, mem," Christina said, humbly, proceeding with her work.

Miss White, being left to think over these things, was beginning to believe that, after all, her obduracy was not likely to be of much service to her. Would it not be wiser to treat with the enemy—perhaps to outwit him by a show of forgiveness? Here they were approaching the end of the voyage—at least Christina seemed to intimate as much; and if they were not exactly within call of friends, they would surely be within rowing distance of some inhabited island, even Gometra, for example. And if only a message could be sent to Castle Dare? Lady Macleod and Janet Macleod were women. They would not countenance this monstrous thing. If she could only reach them, she would be safe.

The rose-pink died away from the long promontories, and was succeeded by a sombre gray; the glory in the west sank down; a wan twilight came over the sea and the sky; and a small golden star, like the point of a needle, told where the Dubh Artach men had lit their beacon for the coming night. The *Umpire* lay and idly rolled in this dead calm; Macleod paced up and down the deck in the solemn stillness. Hamish threw a tarpaulin over the sky-light of the saloon to cover the bewildering light from below; and then, as the time went slowly by, darkness came over the land and the sea. They were alone with the night, and the lapping waves, and the stars.

About ten o'clock there was a loud rattling of blocks and cordage—the first puff of a coming breeze had struck her. The men were at their posts in a moment; there were a few sharp, quick orders from Hamish; and presently the old *Umpire*, with her great boom away over her quarter, was running free before a light southeasterly wind.

"Ay, ay!" said Hamish, in sudden gladness, "we will soon be by Ardalanish Point with a fine wind like this, Sir Keith; and if you would rather hef no lights on her—well, it is a clear night whateffer; and the *Dunara* she will hef up her lights."

The wind came in bits of squalls, it is true, but the sky overhead remained clear, and the *Umpire* bowled merrily along. Macleod was still on deck. They rounded the Ross of Mull, and got into the smoother waters of the Sound. Would any of the people in the cottages at Erraidh see this gray ghost of a vessel go gliding past over the dark water? Behind them burned the yellow eye of Dubh Artach; before them a few small red points told them of the Iona cottages; and still this phantom gray vessel held on her way. The *Umpire* was nearing her last anchorage.

And still she steals onward, like a thief in the night. She has passed through the Sound; she is in the open sea again; there is a calling of startled birds from over the dark bosom of the deep. Then far away they watch the lights of a steamer: but she is miles from their course; they can not even hear the throb of her engines.

It is another sound they hear—a low booming as of distant thunder. And that black thing away on their right—scarcely visible over the darkened waves—is that the channelled and sea-bird-haunted Staffa, trembling through all her caves under the shock of the smooth Atlantic surge? For all the clearness of the star-lit sky, there is

a wild booming of waters all around her rocks; and the giant caverns answer; and the thunder shudders out to the listening sea.

The night drags on. The Dutchman is fast asleep in his vast Atlantic bed; the dull roar of the waves he has heard for millions of years is not likely to awake him. And Fladda, and Lunga: surely this ghost-gray ship that steals by is not the old *Umpire* that used to visit them in the gay summer-time, with her red ensign flying, and the blue seas all around her? But here is a dark object on the waters that is growing larger and larger as one approaches it. The black outline of it is becoming sharp against the clear dome of stars. There is a gloom around as one gets nearer and nearer the bays and cliffs of this lonely island; and now one hears the sound of breakers on the rocks. Hamish and his men are on the alert. The top-sail has been lowered. The heavy cable of the anchor lies ready by the windlass. And then, as the *Umpire* glides into smooth water, and her head is brought round to the light breeze, away goes the anchor with a rattle that awakes a thousand echoes; and all the startled birds among the rocks are calling through the night—the sea-pyots screaming shrilly, the curlews uttering their warning note, the herons croaking as they wing their slow flight away across the sea. The *Umpire* has got to her anchorage at last.

And scarcely was the anchor down when they brought him a message from the English lady. She was in the saloon, and wished to see him. He could scarcely believe this, for it was now past midnight, and she had never come into the saloon before. But he went down through the forecastle, and through his own state-room, and opened the door of the saloon.

For a second the strong light almost blinded him; but at all events he knew she was sitting there, and that she was regarding him with no fierce indignation at all, but with quite a friendly look.

"Gertrude!" said he, in wonder; but he did not approach her. He stood before her, as one who was submissive.

"So we have got to land at last," said she: and more and more he wondered to hear the friendliness of her voice. Could it be true, then? Or was it only one of those visions that had of late been torturing his brain?

"Oh yes, Gerty!" said he; "we have got to an anchorage."

"I thought I would sit up for it," said she. "Christina said we should get to land some time to-night, and I thought I would like to see you. Because you know, Keith, you have used me very badly. And won't you sit down?"

He accepted that invitation. *Could it be true? could it be true?* This was ringing in his ears. He heard her only in a bewildered way.

"And I want you to tell me what you mean to do with me," said she, frankly and graciously: "I am at your mercy, Keith."

"Oh, not that—not that," said he. And he added, sadly enough, "It is I who have been at your mercy since ever I saw you, Gerty; and it is for you to say what is to become of you and of me. And have you got over your anger now?—and will you think of all that made me do this, and try to forgive it for the sake of my love for you, Gerty? Is there any chance of that now?"

She rather avoided the earnest gaze that was bent on her. She did not notice how nervously his hand gripped the edge of the table near him.

"Well, it is a good deal to forgive, Keith; you will acknowledge that yourself; and though you used to think that I was ready to sacrifice every thing for fame, I did not expect you would make me a nine days' wonder in this way. I suppose the whole thing is in the papers now?"

"Oh no, Gerty; I sent a message to your father."

"Well, that was kind of you—and audacious. Were you not afraid of his overtaking you? The *Umpire* is not the swiftest of sailers, you used to say; and you know there are telegraphs and railways to all the ports."

"He did not know you were in the *Umpire*, Gerty. But of course, if he were very anxious about you, he would write or come to Dare. I should not be surprised if he were there now."

A quick look of surprise and gladness sprang to her face.

"Papa—at Castle Dare!" she exclaimed. "And Christina says it is not far from here."

"Not many miles away."

"Then of course they will know we are here in the morning!" she cried, in the indiscretion of sudden joy. "And they will come out for me."

"Oh no, Gerty, they will not come out for you. No human being but those on board knows that we are here. Do you think they could see you from Dare? And there is no one living now on the island. We are alone in the sea."

The light died away from her face; but she said, cheerfully enough:

"Well, I am at your mercy then, Keith. Let us take it that way. Now you must tell me what part in the comedy you mean me to play; for the life of me I can't make it out."

"Oh, Gerty, Gerty, do not speak like that!" he exclaimed. "You are breaking my heart! Is there none of the old love left? Is it all a matter for jesting?"

She saw she had been incautious.

"Well," said she, gently, "I was wrong;

I know it is more serious than that; and I am not indisposed to forgive you, if you treat me fairly. I know you have great earnestness of nature; and—and you were very fond of me; and although you have risked a great deal in what you have done, still, men who are very deeply in love don't think much about consequences. And if I were to forgive you, and make friends again, what then?"

"And if we were as we used to be," said he, with a grave wistfulness in his face, "do you not think I would gladly take you ashore, Gerty?"

"And to Castle Dare?"

"Oh yes, to Castle Dare! Would not my mother and Janet be glad to welcome you!"

"And papa may be there?"

"If he is not there, can we not telegraph for him? Why, Gerty, surely you would not be married any where but in the Highlands?"

At the mention of marriage she blanched somewhat; but she had nerved herself to play this part.

"Then, Keith," said she, gallantly, "I will make you a promise. Take me to Castle Dare to-morrow, and the moment I am within its doors I will shake hands with you, and forgive you, and we will be friends again as in the old days."

"We were more than friends, Gerty," said he, in a low voice.

"Let us be friends first, and then who knows what may not follow?" said she, brightly. "You can not expect me to be overprofuse in affection just after being shut up like this?"

"Gerty," said he, and he looked at her with those strangely tired eyes, and there was a great gentleness in his voice, "do you know where you are? You are close to the island that I told you of—where I wish to have my grave on the cliff. But instead of a grave, would it not be a fine thing to have a marriage here? No; do not be alarmed, Gerty! it is only with your own good-will; and surely your heart will consent at last! Would not that be a strange wedding, too; with the minister from Salen, and your father on board, and the people from Dare? Oh, you would see such a number of boats come out that day, and we would go proudly back; and do you not think there would be a great rejoicing that day? Then all our troubles would be at an end, Gerty! There would be no more fear; and the theatres would never see you again; and the long, happy life we should lead, we two together! And do you know the first thing I would get you, Gerty?—it would be a new yacht! I would go to the Clyde, and have it built all for you. I would not have you go out again in this yacht, for you would then remember the days in which I was cruel to you; but in a new yacht you would not remember that any more; and do you not think we would have many a pleasant, long summer day on the deck of her, and only ourselves, Gerty? And you would sing the songs I first heard you sing, and I think the sailors would imagine they heard the singing of the mermaid of Colonsay; for there is no one can sing as you can sing, Gerty. I think it was that first took away my heart from me."

"But we can talk about all these things when I am on shore again," said she, coldly. "You can not expect me to be very favorably disposed so long as I am shut up here."

"But then," he said, "if you were on shore you might go away again from me, Gerty! The people would get at your ear again; they would whisper things to you; you would think about the theatres again. I have saved you, sweetheart; can I let you go back?"

The words were spoken with an eager affection and yearning; but they sank into her mind with a dull and cold conviction that there was no escope for her through any way of artifice.

"Am I to understand, then," said she, "that you mean to keep me a prisoner here until I marry you?"

"Why do you speak like that, Gerty?"

"I demand an answer to my question."

"I have risked every thing to save you; can I let you go back?"

A sudden flash of desperate anger—even of hatred—was in her eyes: her fine piece of acting had been of no avail.

"Well, let the farce end!" said she, with frowning eyebrows. "Before I came on board this yacht I had some pity for you. I thought you were at least a man, and had a man's generosity. Now I find you a coward, and a tyrant—"

"Gerty!"

"Oh, do not think you have frightened me with your stories of the revenge of your miserable chiefs and their savage slaves! Not a bit of it! Do with me what you like: I would not marry you if you gave me a hundred yachts!"

"Gerty!"

The anguish of his face was growing wild with despair.

"I say, let the farce end! I had pity for you—yes, I had! Now—I hate you!"

He sprang up with a quick cry, as of one shot through the heart. He regarded her, in a bewildered manner, for one brief second; and then he gently said, "Good-night, Gerty! God forgive you!" and he staggered backward, and got out of the saloon, leaving her alone.

See! the night is still fine. All around this solitary bay there is a wall of rock, jet-black, against the clear, dark sky, with its myriad twinkling stars. The new moon has arisen, but it sheds but little radiance

yet down there in the south. There is a sharper gleam from one lambent planet—a thin line of golden-yellow light that comes all the way across from the black rocks until it breaks in flashes among the ripples close to the side of the yacht. Silence once more reigns around; only from time to time one hears the croak of a heron from the dusky shore.

What can keep this man up so late on deck? There is nothing to look at but the great bows of the yacht black against the pale gray sea, and the tall spars and the rigging going away up into the star-lit sky, and the suffused glow from the sky-light touching a yellow-gray on the main-boom. There is no need for the anchor-watch that Hamish was insisting on. The equinoctials are not likely to begin on such a night as this.

He is looking across the lapping gray water to the jet-black line of cliff. And there are certain words haunting him. He can not forget them; he can not put them away.

* * * * * *

WHEREFORE IS LIGHT GIVEN TO HIM THAT IS IN MISERY, AND LIFE UNTO THE BITTER IN SOUL?.....WHICH LONG FOR DEATH, BUT IT COMETH NOT; AND DIG FOR IT MORE THAN FOR HIDDEN TREASURES.....WHICH REJOICE EXCEEDINGLY, AND ARE GLAD WHEN THEY CAN FIND THE GRAVE.

* * * * * *

Then in the stillness of the night he heard a breathing. He went forward, and found that Hamish had secreted himself behind the windlass. He uttered some exclamation in the Gaelic, and the old man rose and stood guiltily before him.

"Have I not told you to go below before? and will I have to throw you down into the forecastle?"

The old man stood irresolute for a moment. Then he said, also in his native tongue:

"You should not speak like that to me, Sir Keith: I have known you many a year."

Macleod caught Hamish's hand.

"I beg your pardon, Hamish. You do not know. It is a sore heart I have this night."

"Oh, God help us! Do I not know that!" he exclaimed, in a broken voice; and Macleod, as he turned away, could hear the old man crying bitterly in the dark. What else could Hamish do now—for him who had been to him as the son of his old age?

"Go below now, Hamish," said Macleod, in a gentle voice; and the old man slowly and reluctantly obeyed.

But the night had not drawn to day when Macleod again went forward, and said, in a strange, excited whisper:

"Hamish, Hamish, are you awake now?"

Instantly the old man appeared: he had not turned into his berth at all.

"Hamish, Hamish, do you hear the sound?" Macleod said, in the same wild way; "do you not hear the sound?"

"What sound, Sir Keith?" said he; for indeed there was nothing but the lapping of the water along the side of the yacht and a murmur of ripples along the shore.

"Do you not hear it, Hamish? It is a sound as of a brass-band!—a brass-band playing music—as if it was in a theatre. Can you not hear it, Hamish?"

"Oh, God help us! God help us!" Hamish cried.

"You do not hear it, Hamish?" he said. "Ah, it is some mistake. I beg your pardon for calling you, Hamish: now you will go below again."

"Oh no, Sir Keith," said Hamish. "Will I not stay on deck now till the morning? It is a fine sleep I have had; oh yes, I had a fine sleep. And how is one to know when the equinoctials may not come on?"

"I wish you to go below, Hamish."

And now this sound that is ringing in his ears is no longer of the brass-band that he had heard in the theatre. It is quite different. It has all the ghastly mirth of that song that Norman Ogilvie used to sing in the old, half-forgotten days. What is it that he hears?

"King Death was a rare old fellow,
He sat where no sun could shine;
And he lifted his hand so yellow,
And poured out his coal-black wine!
Hurrah! hurrah! hurrah! for the coal-black wine!"

It is a strange mirth. It might almost make a man laugh. For do we not laugh gently when we bury a young child, and put the flowers over it, and know that it is at peace? The child has no more pain at the heart. Oh, Norman Ogilvie, are you still singing the wild song? and are you laughing now? or is it the old man Hamish that is crying in the dark?

* * * * * *

"There came to him many a maiden
Whose eyes had forgot to shine;
And widows with grief o'erladen,
For a draught of his sleepy wine.
Hurrah! hurrah! hurrah! for the coal-black wine!"

It is such a fine thing to sleep—when one has been fretting all the night, and spasms of fire go through the brain! Ogilvie, Ogilvie, do you remember the laughing Duchess? do you think she would laugh over one's grave, or put her foot on it, and stand relentless, with anger in her eyes? That is a sad thing; but after it is over there is sleep.

* * * * * *

"All came to the rare old fellow,
Who laughed till his eyes dropped brine,
As he gave them his hand so yellow,
And pledged them in Death's black wine!
Hurrah! hurrah! hurrah! for the coal-black wine!"

Hamish!—Hamish!—will you not keep her

away from me? I have told Donald what pibroch he will play; I want to be at peace now. But the brass-band—the brass-band—I can hear the blare of the trumpets; and Ulva will know that we are here, and the Gometra men, and the sea-birds too, that I used to love. But she has killed all that now, and she stands on my grave. She will laugh, for she was light-hearted, like a young child. But you, Hamish, you will find the quiet grave for me; and Donald will play the pibroch for me that I told him of; and you will say no word to her of all that is over and gone.

* * * * * *

See—he sleeps. This haggard-faced man is stretched on the deck; and the pale dawn, arising in the east, looks at him, and does not revive him, but makes him whiter still. You might almost think he was dead. But Hamish knows better than that; for the old man comes stealthily forward; and he has a great tartan plaid in his hands, and very gently indeed he puts it over his young master. And there are tears running down Hamish's face, and he says, "The brave lad! the brave lad!"

CHAPTER XLVI.

THE END.

"DUNCAN," said Hamish, in a low whisper—for Macleod had gone below, and they thought he might be asleep in the small, hushed state-room—"this is a strange-looking day, is it not? And I am afraid of it in this open bay, with an anchorage no better than a sheet of paper for an anchorage. Do you see now how strange-looking it is?"

Duncan Cameron also spoke in his native tongue, and he said:

"That is true, Hamish. And it was a day like this there was when the *Solan* was sunk at her moorings in Loch Hourn. Do you remember, Hamish? And it would be better for us now if we were in Loch Tua, or Loch-na-Keal, or in the dock that was built for the steamer at Tiree. I do not like the look of this day."

Yet to an ordinary observer it would have seemed that the chief characteristic of this pale, still day was extreme and settled calm. There was not a breath of wind to ruffle the surface of the sea; but there was a slight, glassy swell, and that only served to show curious opalescent tints under the suffused light of the sun. There were no clouds; there was only a thin veil of faint and sultry mist all across the sky; the sun was invisible, but there was a glare of yellow at one point of the heavens. A dead calm; but heavy, oppressed, sultry. There was something in the atmosphere that seemed to weigh on the chest.

"There was a dream I had this morning," continued Hamish, in the same low tones. "It was about my little granddaughter Christina. You know my little Christina, Duncan. And she said to me, 'What have you done with Sir Keith Macleod? Why have you not brought him back? He was under your care, grandfather.' I did not like that dream."

"Oh, you are becoming as bad as Sir Keith Macleod himself!" said the other. "He does not sleep. He talks to himself. You will become like that if you pay attention to foolish dreams, Hamish."

Hamish's quick temper leaped up.

"What do you mean, Duncan Cameron, by saying 'as bad as Sir Keith Macleod?' You—you come from Ross: perhaps they have not good masters there. I tell you there is not any man in Ross, or in Sutherland either, is as good a master, and as brave a lad, as Sir Keith Macleod—not any one, Duncan Cameron!"

"I did not mean any thing like that, Hamish," said the other, humbly. "But there was a breeze this morning. We could have got over to Loch Tua. Why did we stay here, where there is no shelter and no anchorage? Do you know what is likely to come after a day like this?"

"It is your business to be a sailor on board this yacht; it is not your business to say where she will go," said Hamish.

But all the same the old man was becoming more and more alarmed at the ugly aspect of this dead calm. The very birds, instead of stalking among the still pools, or lying buoyant on the smooth waters, were excitedly calling, and whirring from one point to another.

"If the equinoctials were to begin now," said Duncan Cameron, "this is a fine place to meet the equinoctials! An open bay, without shelter, and a ground that is no ground for an anchorage. It is not two anchors or twenty anchors would hold in such a ground."

Macleod appeared: the men were suddenly silent. Without a word to either of them—and that was not his wont—he passed to the stern of the yacht. Hamish knew from his manner that he would not be spoken to. He did not follow him, even with all this vague dread on his mind.

The day wore on to the afternoon. Macleod, who had been pacing up and down the deck, suddenly called Hamish. Hamish came aft at once.

"Hamish," said he, with a strange sort of laugh, "do you remember this morning, before the light came? Do you remember that I asked you about a brass-band that I heard playing?"

Hamish looked at him and said, with an earnest anxiety:

"Oh, Sir Keith, you will pay no heed to that! It is very common; I have heard

them say it is very common. Why, to hear a brass-band, to be sure! There is nothing more common than that. And you will not think you are unwell merely because you think you can hear a brass-band playing!"

"I want you to tell me, Hamish," said he, in the same jesting way, "whether my eyes have followed the example of my ears, and are playing tricks. Do you think they are blood-shot, with my lying on deck in the cold? Hamish, what do you see all around?"

The old man looked at the sky, and the shore, and the sea. It was a marvellous thing. The world was all enshrouded in a salmon-colored mist: there was no line of horizon visible between the sea and the sky.

"It is red, Sir Keith," said Hamish.

NEARING THE END.—[SEE PAGE 275.]

"Ah! Am I in my senses this time? And what do you think of a red day, Hamish? That is not a usual thing."

"Oh, Sir Keith, it will be a wild night this night! And we can not stay here, with this bad anchorage."

"And where would you go, Hamish—in a dead calm?" Macleod asked, still with a smile on the wan face.

"Where would I go?" said the old man, excitedly. "I—I will take care of the yacht. But you, Sir Keith—oh! you—you will go ashore now. Do you know, Sir, the sheiling that the shepherd had? It is a poor place—oh yes; but Duncan Cameron and I will take some things ashore. And do you not think we can look after the yacht? She has met the equinoctials before, if it is the equinoctials that are beginning. She has met them before; and can not she meet them now? But you, Sir Keith, you will go ashore."

Macleod burst out laughing in an odd sort of fashion.

"Do you think I am good at running away when there is any kind of danger, Hamish? Have you got into the English way? Would you call me a coward too? Nonsense, nonsense, nonsense, Hamish! I—why, I am going to drink a glass of the coal-black wine, and have done with it. I will drink it to the health of my sweetheart, Hamish!"

"Sir Keith," said the old man, beginning to tremble, though he but half understood the meaning of the scornful mirth, "I have had charge of you since you were a young lad."

"Very well."

"And Lady Macleod will ask of me, 'Such and such a thing happened: what did you do for my son?' Then I will say, 'Your ladyship, we were afraid of the equinoctials, and we got Sir Keith to go ashore; and the next day we went ashore for him; and now we have brought him back to Castle Dare!'"

"Hamish, Hamish, you are laughing at me! Or you want to call me a coward? Don't you know I should be afraid of the ghost of the shepherd who killed himself? Don't you know that the English people call me a coward?"

"May their souls dwell in the downmost hall of perdition!" said Hamish, with his cheeks becoming a gray-white; "and every woman that ever came of the accursed race!"

He looked at the old man for a second, and he gripped his hand.

"Do not say that, Hamish—that is folly. But you have been my friend. My mother will not forget you—it is not the way of a Macleod to forget—whatever happens to me."

"Sir Keith!" Hamish cried, "I do not know what you mean. But you will go ashore before the night?"

"Go ashore?" Macleod answered, with a return to his wild, bantering tone, "when I am going to see my sweetheart? Oh no! Tell Christina, now. Tell Christina to ask the young English lady to come into the saloon, for I have something to say to her. Be quick, Hamish!"

Hamish went away, and before long he returned with the answer that the young English lady was in the saloon. And now he was no longer haggard and piteous, but joyful, and there was a strange light in his eyes.

"Sweetheart," said he, "are you waiting for me at last? I have brought you a long way. Shall we drink a glass now at the end of the voyage?"

"Do you wish to insult me?" said she; but there was no anger in her voice: there was more of fear in her eyes as she regarded him.

"You have no other message for me than the one you gave me last night, Gerty?" said he, almost cheerfully. "It is all over, then? You would go away from me forever? But we will drink a glass before we go!"

He sprang forward, and caught both her hands in his with the grip of a vise.

"Do you know what you have done, Gerty?" said he, in a low voice. "Oh, you have soft, smooth, English ways; and you are like a rose leaf; and you are like a queen, whom all people are glad to serve. But do you know that you have killed a man's life? And there is no penalty for that in the south, perhaps; but you are no longer in the south. And if you have this very night to drink a glass with me, you will not refuse it? It is only a glass of the coal-black wine!"

She struggled back from him, for there was a look in his face that frightened her. But she had a wonderful self-command.

"Is that the message I was to hear?" said she, coldly.

"Why, sweetheart, are you not glad? Is not that the only gladness left for you and for me, that we should drink one glass together, and clasp hands, and say good-by? What else is there left? What else could come to you and to me? And it may not be this night, or to-morrow night; but one night I think it will come; and then, sweetheart, we will have one more glass together, before the end."

He went on deck. He called Hamish.

"Hamish," said he, in a grave, matter-of-fact way, "I don't like the look of this evening. Did you say the sheiling was still on the island?"

"Oh yes, Sir Keith," said Hamish, with great joy; for he thought his advice was going to be taken after all.

"Well, now, you know the gales, when they begin, sometimes last for two, or three, or four days; and I will ask you to see that Christina takes a good store of things to the sheiling, before the darkness comes on. Take plenty of things, now, Hamish, and

put them in the sheiling, for I am afraid this is going to be a wild night."

Now, indeed, all the red light had gone away; and as the sun went down there was nothing but a spectral whiteness over the sea and the sky. And the atmosphere was so close and sultry that it seemed to suffocate one. Moreover, there was a dead calm; if they had wanted to get away from this exposed place, how could they? They could not get into the gig and pull this great yacht over to Loch Tua.

It was with a light heart that Hamish set about this thing; and Christina forthwith filled a hamper with tinned meats, and bread, and whiskey, and what not. And fuel was taken ashore, too, and candles, and a store of matches. If the gales were coming on, as appeared likely from this ominous-looking evening, who could tell how many days and nights the young master—and the English lady, too, if he desired her company—might not have to stay ashore, while the men took the chance of the sea with this yacht, or perhaps seized the occasion of some lull to make for some place of shelter? There was Loch Tua, and there was the bay at Bunessan, and there was the little channel called Polterriv, behind the rocks opposite Iona. Any shelter at all was better than this exposed place, with the treacherous anchorage.

Hamish and Duncan Cameron returned to the yacht.

"Will you go ashore now, Sir Keith?" the old man said.

"Oh no; I am not going ashore yet. It is not yet time to run away, Hamish."

He spoke in a friendly and pleasant fashion, though Hamish, in his increasing alarm, thought it no proper time for jesting. They hauled the gig up to the davits, however, and again the yacht lay in dead silence in this little bay.

The evening grew to dusk; the only change visible in the spectral world of pale yellow-white mist was the appearance in the sky of a number of small, detached, bulbous-looking clouds of a dusky blue-gray. They had not drifted hither, for there was no wind. They had only appeared. They were absolutely motionless.

But the heat and the suffocation in this atmosphere became almost insupportable. The men, with bare heads, and jerseys unbuttoned at the neck, were continually going to the cask of fresh water beside the windlass. Nor was there any change when the night came on. If any thing, the night was hotter than the evening had been. They awaited in silence what might come of this ominous calm.

Hamish came aft.

"I beg your pardon, Sir Keith," said he, "but I am thinking we will have an anchor-watch to-night."

"You will have no anchor-watch to-night," Macleod answered, slowly, from out of the darkness. "I will be all the anchor-watch you will need, Hamish, until the morning."

"You, Sir!" Hamish cried. "I have been waiting to take you ashore; and surely it is ashore that you are going!"

Just as he had spoken there was a sound that all the world seemed to stand still to hear. It was a low, murmuring sound of thunder; but it was so remote as almost to be inaudible. The next moment an awful thing occurred. The two men standing face to face in the dark suddenly found themselves in a blaze of blinding steel-blue light, and at the very same instant the thunder-roar crackled and shook all around them like the firing of a thousand cannon. How the wild echoes went booming over the sea! Then they were in the black night again. There was a period of awed silence.

"Hamish," Macleod said, quickly, "do as I tell you now! Lower the gig; take the men with you, and Christina, and go ashore, and remain in the sheiling till the morning."

"I will not!" Hamish cried. "Oh, Sir Keith, would you have me do that!"

Macleod had anticipated his refusal. Instantly he went forward and called up Christina. He ordered Duncan Cameron and John Cameron to lower away the gig. He got them all in but Hamish.

"Hamish," said he, "you are a smaller man than I. Is it on such a night that you would have me quarrel with you? Must I throw you into the boat?"

The old man clasped his trembling hands together as if in prayer; and he said, with an agonized and broken voice:

"Oh, Sir Keith, you are my master, and there is nothing I will not do for you; but only this one night you will let me remain with the yacht. I will give you the rest of my life; but only this one night—"

"Into the gig with you!" Macleod cried, angrily. "Why, man, don't you think I can keep anchor-watch?" But then he added, very gently, "Hamish, shake hands with me now. You were my friend, and you must get ashore before the sea rises."

"I will stay in the dingey, then," the old man entreated.

"You will go ashore, Hamish; and this very instant, too. If the gale begins, how will you get ashore? Good-by, Hamish—*good-night!*"

Another white sheet of flame quivered all around them, just as this black figure was descending into the gig; and then the fierce hell of sounds broke loose once more. Sea and sky together seemed to shudder at the wild uproar; and far away the sounds went thundering through the hollow night. How could one hear if there was any sobbing in that departing boat, or any last cry of fare-

well? It was Ulva calling now; and Fladda answering from over the black water; and the Dutchman is surely awake at last!

There came a stirring of wind from the east, and the sea began to moan. Surely the poor fugitives must have reached the shore now. And then there was a strange noise in the distance: in the awful silence between the peals of thunder it would be heard; it came nearer and nearer—a low murmuring noise, but full of a secret life and thrill—it came along like the tread of a thousand armies—and then the gale struck its first blow. The yacht reeled under the stroke, but her bows staggered up again like a dog that has been felled, and after one or two convulsive plunges she clung hard at the strained cables. And now the gale was growing in fury, and the sea rising. Blinding showers of rain swept over, hissing and roaring; the white tongues of flame were shooting this way and that across the startled heavens; and there was a more awful thunder than even the falling of the Atlantic surge booming into the great sea-caves. In the abysmal darkness the spectral arms of the ocean rose white in their angry clamor; and then another blue gleam would lay bare the great heaving and wreathing bosom of the deep. What devil's dance is this? Surely it can not be Ulva—Ulva the green-shored—Ulva that the sailors in their love of her call softly *Ool-a-va*—that is laughing aloud with wild laughter on this awful night? And Colonsay, and Lunga, and Fladda—they were beautiful and quiet in the still summer-time; but now they have gone mad, and they are flinging back the plunging sea in white masses of foam, and they are shrieking in their fierce joy of the strife. And Staffa—Staffa is far away and alone; she is trembling to her core: how long will the shuddering caves withstand the mighty hammer of the Atlantic surge? And then again the sudden wild gleam startles the night—and one sees, with an appalling vividness, the driven white waves and the black islands—and then again a thousand echoes go booming along the iron-bound coast. What can be heard in the roar of the hurricane, and the hissing of rain, and the thundering whirl of the waves on the rocks? Surely not the one glad last cry: SWEETHEART! YOUR HEALTH! YOUR HEALTH IN THE COAL-BLACK WINE!

The poor fugitives crouching in among the rocks: is it the blinding rain or the driven white surf that is in their eyes? But they have sailors' eyes; they can see through the awful storm; and their gaze is fixed on one small green point far out there in the blackness—the starboard light of the doomed ship. It wavers like a will-o'-the-wisp, but it does not recede; the old *Umpire* still clings bravely to her chain cables.

And amid all the din of the storm they hear the voice of Hamish lifted aloud in lamentation:

"Oh, the brave lad! the brave lad! And who is to save my young master now; and who will carry this tale back to Castle Dare? They will say to me: 'Hamish, you had charge of the young lad: you put the first gun in his hand: you had charge of him; he had the love of a son for you: what is it you have done with him this night?' He is my Absalom; he is my brave young lad: oh, do you think that I will let him drown and do nothing to try to save him? Do you think that? Duncan Cameron, are you a man? Will you get into the gig with me and pull out to the *Umpire*?"

"By God," said Duncan Cameron, solemnly, "I will do that! I have no wife; I do not care. I will go into the gig with you, Hamish; but we will never reach the yacht—this night or any night that is to come."

Then the old woman Christina shrieked aloud, and caught her husband by the arm.

"Hamish! Hamish! Are you going to drown yourself before my eyes?"

He shook her hand away from him.

"My young master ordered me ashore: I have come ashore. But I myself, I order myself back again. Duncan Cameron, they will never say that we stood by and saw Macleod of Dare go down to his grave!"

They emerged from the shelter of this great rock; the hurricane was so fierce that they had to cling to one bowlder after another to save themselves from being whirled into the sea. But were these two men by themselves? Not likely! It was a party of five men that now clambered along the slippery rocks to the shingle up which they had hauled the gig, and one wild lightning-flash saw them with their hands on the gunwale, ready to drag her down to the water. There was a surf raging there that would have swamped twenty gigs: these five men were going of their own free-will and choice to certain death—so much had they loved the young master.

But a piercing cry from Christina arrested them. They looked out to sea. What was this sudden and awful thing? Instead of the starboard green light, behold! the port red light—and that moving! Oh, see! how it recedes, wavering—flickering through the whirling vapor of the storm! And there again is the green light! Is it a witch's dance, or are they strange death-fires hovering over the dark ocean grave? But Hamish knows too well what it means; and with a wild cry of horror and despair, the old man sinks on his knees and clasps his hands, and stretches them out to the terrible sea.

"Oh, Macleod! Macleod! are you going away from me forever? and we will go up the hills together and on the lochs together no more—no more—no more! Oh, the brave lad that he was!—and the good master!—and who was not proud of him?—my handsome lad!—and he the last of the Macleods of Dare!"

Arise, Hamish, and have the gig hauled up into shelter; for will you not want it when the gale abates, and the seas are smooth, and you have to go away to Dare, you and your comrades, with silent tongues and sombre eyes? Why this wild lamentation in the darkness of the night? The stricken heart that you loved so well has found peace at last; the coal-black wine has been drank; there is an end! And you, you poor cowering fugitives, who only see each other's terrified faces when the wan gleam of the lightning blazes through the sky, perhaps it is well that you should weep and wail for the young master; but that is soon over, and the day will break. And this is what I am thinking of now: when the light comes, and the seas are smooth, then which of you—oh, which of you all will tell this tale to the two women at Castle Dare?

So fair shines the morning sun on the white sands of Iona! The three days' gale is over. Behold how Ulva—Ulva the green-shored—the *Ool-a-va* that the sailors love—is laughing out again to the clear skies! And the great skarts on the shores of Erisgeir are spreading abroad their dusky wings to get them dried in the sun; and the seals are basking on the rocks in Loch-na-Keal; and in Loch Scridain the white gulls sit buoyant on the blue sea. There go the Gometra men in their brown-sailed boat to look after the lobster traps at Staffa; and very soon you will see the steamer come round the far Cailleach Point; over at Erraidh they are signaling to the men at Dubh Artach; and they are glad to have a message from them after the heavy gale. The new, bright day has begun; the world has awakened again to the joyous sunlight; there is a chattering of the sea-birds all along the shores. It is a bright, eager, glad day for all the world. But there is silence in Castle Dare!

THE IMAGE OF SAN DONATO.

A CHRISTMAS STORY.

I.

"Buy the respect of the insolent."—*Turkish Proverb.*

DOWN in the old Trastevere quarter of Rome the festa of St. Cecilia was being celebrated in her church and convent.

The day was in harmony with the memory of the noble Roman lady—a sky serenely blue, sunshine on fountain and temple ruin, the atmosphere golden with autumn's richness of coloring. The adjacent narrow streets were deserted, swept by one of those waves of popular impulse so characteristic of Italian cities; files of priestly students from the colleges passed through the gateway, this band clad in black, that one in scarlet or purple, and formed lines of wavering color in their transition across the court to the shadowy portico, flanked by the high, grim, convent wall—that modern reading of St. Cecilia's martyrdom. High above the surging crowd of devotees and beggars the campanile soared into the sunny air, outlined against that azure Roman sky, and sent forth its tinkling peal of summons to vespers, like the silvery intonation of a benediction.

Two strangers entered the gate, the elder sombre and quiet, the younger eager and delighted by the spectacle. Their respective positions were apparent at a glance. Mademoiselle Durand, in her neat black dress, with her thin sallow face and repressed expression, was a French governess; the young American girl beside her, richly attired in blue velvet, was her charge.

"I am a Cecilia, although far from a saint," said the latter, gayly. "Ah! how one loves to hear about her—the beautiful martyr of Raphael's pictures! Do you believe she is now singing among the heavenly choirs up there, mademoiselle?" She paused a moment to gaze at the sky, the sun-bathed campanile, with a wistfulness not unfamiliar to her companion, and which she attributed to an imaginative childhood. "Perhaps the evening bells of Rome are the echoes of her voice in another world," she added, musingly.

"Come," said mademoiselle, dryly.

"When I am grown up perhaps I will build a convent of St. Cecilia in America with my own money," continued the girl, meditatively.

Mademoiselle's eyes sparkled; she caressed the hand within her arm.

"Chère enfant! But I forget; it is not your faith."

"My faith? I always go to mass with you; I am not only devout, je suis bigote," rejoined her pupil.

Then they entered the church. St. Cecilia's statue, wrought in purest marble, lay revealed beneath the altar on this one day of the year, when her crypt in the catacomb also blooms with flowers. Transfigured by the radiance of silver lamps and myriads of tapers, enshrined in garlands of roses, veiled in clouds of incense, the statue in its niche lent a charm to the gaudy ornaments of the high altar, and all the tinsel draperies ex-

tending from column to column along the aisle. On the right a star of light was visible in the miraculous bath-room, with its dim frescoes and ancient pillars; the nuns flitted behind the lattice of their gallery.

Mademoiselle, a devout Catholic, knelt at different shrines. Her pupil also knelt. The music, the chant, the glow of those gilded and crimson draperies overhead, seen through the wreaths of incense, all blended. She closed her eyes. She also must pray. For what boon? She smiled suddenly as she murmured:

"O God, please send my papa to Rome for Christmas-day."

Then she rose to her feet, threaded her way among the ranks of kneeling students, and mademoiselle found her in the court thrusting money into the hands of a group of little boys, the true Trasteverini, with large, liquid eyes.

"We shall be late, I fear," admonished the governess, as they finally quitted the church.

The young girl, Cecilia Denvil, had insisted on walking to this particular sanctuary in the Trastevere quarter instead of on the Pincian Hill. She was both winning and perverse.

At an angle of the crooked streets the window of a shop attracted her attention. Instantly the shrine of St. Cecilia, with its flowers and silver lamps, vanished from her mind. The shop was a mere niche in an old palace wall, brimming over, as it were, into the street, with such odds and ends as a bit of tapestry, a dark picture, a heap of ancient books, a tray of coins and medals, an idol fashioned by Chinese skill.

"What is it?" cried Cecilia.

"Only an image," replied mademoiselle.

The object of Cecilia's interest was a figure on a bracket in the shop window. She darted into the shop, her governess following with a patient smile. What harm could result from her pupil's chatting with the old shop-keeper clad in shabby black, with a rusty satin stock about his neck, and a face tinged yellow by age, as were those of the dilapidated marble busts ranged above his head in the obscurity of the shop? Ay, what harm indeed, mademoiselle? If one could read futurity!

The old man, without surprise at the advent of a young girl in blue velvet, took down the image, and explained to her its history in his slow, musical, Roman tongue. Even mademoiselle lent an ear of unwilling fascination to the tale. The little wooden figure, a foot in height, was San Donato. Behold, signorina mia, the beauty of the face, the robes tinted a soft rose, with ample gold margin, the aureole and palm of martyrdom in the hand. In the great Demidoff villa of San Donato a patron saint was placed in a niche above the portal of certain suites of apartments, as guardian spirit, by the builder. That brought good luck. The Russian prince is dead, signorina, and the nephew heir cast out the saints with quantities of other valuables for sale. For this reason poor San Donato, patron of the whole place, is now perched on a shelf in a little shop at Rome.

Cecilia listened with sparkling eyes, and her head a trifle on one side.

"San Donato shall be my saint," she cried, extending her hands. "Two hundred francs? I have more in my purse. You need not frown, mademoiselle; it is my pocket-money from my papa in America, to spend as I choose. Good-by, signor; I will come to see you again some time."

The old shop-keeper looked after her a moment, then drew from under a chair a repast of dry bread and an onion, interrupted by the purchaser.

"After all, San Donato might have brought me luck had I kept him longer," he muttered, draining the little flask of wine as he sat on the door-step, and musing with that curious mixture of avarice and regret at losing a treasure peculiar to the connoisseur.

San Donato was carried along the street by his happy possessor somewhat in the fashion of a new doll. Mademoiselle hid his light under a bushel by laying a fold of shawl over his head and aureole. Cecilia's fancy was captivated by his history even more than by his pensive face and gorgeous robes. San Donato, deposed from his lofty estate in the palace of a Russian prince, should preside as guardian spirit of her home. The image was invested with the gifts of the good fairy as much as he embodied any religious symbol. *His mission was to avert evil.* The saint passed to a new shrine without attendant priests, acolytes, and banners, the swinging of censers, the tinkling of bells, as in the fine old days before Rome was a modern European capital. It was not even borne aloft on sailors' shoulders, like the silver statue of Our Lady at Marseilles, or the miracle-working black Madonna of Montenero at Leghorn. Instead, San Donato moved under the arm of a young girl, muffled in a shawl, skirting the bridge, the quay, the square, now in sunshine, now in shadow, and finally gained the Piazza di SS. Apostoli. Here he was conducted across a court adorned with mouldy statues, and vanished up a broad stairway.

On the third story of the palazzo, shorn of its former papal glories, and yet not degenerated to shabbiness, a door bore the card of Mrs. Henry Denvil. Governess and pupil entered this apartment, and each sought her respective chamber. Cecilia tossed aside her hat, placed the image on the table, and, resting her chin on her hand, gazed at it steadfastly. San Donato, with his aureole glistening, and holding his palm branch,

seemed to return her scrutiny mildly—even to interpret her thought. She had never possessed a confidante other than a company of dolls, now banished as too juvenile companions. "Do you see how it will be?" she said aloud to the image. "You shall be placed in the salon, and look down on us all. Nobody will ever banish you again to a dirty little shop. Perhaps my papa will come over for Christmas. Do not tell—I begged him to come in my last letter after mademoiselle had corrected. I do not spell very well in English, you know, while Jack has forgotten it altogether, mamma says. Jack is at school in Switzerland, and I have not seen him for two years. He is my brother."

She took up her saint again, and went along the corridor. Her head was erect, and a soft smile played about her mouth. She peeped into the salon, drew back, reflected a moment, and entered. This salon possessed the charm for her of forbidden ground. She was rigidly banished from it by her mother, who received here much company. Hence the delight of seeking some niche up high, where San Donato could be placed. Possibly a gay lady would peer at him through her lorgnette, and inquire, "Pray, my dear Mrs. Denvil, where did you get that little statue?"

Mamma would seek *her* lorgnette, and reply: "A little statue? I rent the apartment, furnished, of Monsignor N——. The count may know."

Clearly San Donato deserved a place of honor, and the salon alone was sufficiently good for him. Cecilia traversed the room slowly, seeking a shrine. The place was dark and silent; draperies of sombre damask shrouded the windows and doorways; chandeliers of Venetian glass swayed down from the vaulted ceiling like garlands of pale, frozen flowers; the floor was of polished, inlaid woods; the bronze and green tints of the wall were relieved by gilded cornices and columns bearing the shield of the count's ancestors. All was stately, impressive, if a trifle tarnished; and the effect of patrician elegance, every where apparent, was heightened by an occasional portrait—a Martellini in cavalier hat, with an angel bearing heavenward the family emblem, a hammer; a Martellini as a nun, with long, pale fingers clasped over a rosary.

Cecilia had not completed her survey when she was startled by the tinkle of a bell and the approach of visitors. One glance assured her that egress by means of the door was cut off. She darted behind a sofa in the corner beside the window. Here she crouched on the floor, holding San Donato in her arms, and laughed silently. She did not fear to confront these guests. Who, then? She dreaded the flash of her own mother's eye. Yes, indeed, her pretty mamma had ceased to love her, banished her more and more from her presence, made sharp or dry responses to her prattle. Cecilia sighed inaudibly as she crouched there. Hark! The visitors approached the window; she could touch one by extending her arm from her hiding-place. Who were they? Oh, some of her mamma's gentlemen friends lounging in for an afternoon call. They spoke in a low, rapid tone, and their conversation only reached her because of her propinquity.

Birds of prey sometimes pass over the blooming valleys, the waving grain sown with wild flowers, the dove-cote beneath the cottage eaves, uttering their harsh, discordant cries while on the wing.

The English voice, hoarse and deep: "It promises to be a slow season—awfully dull. No English coming out this year, I hear. Have you recently made the acquaintance of—la belle Américaine?"

The French voice, clear and crisp in utterance: "Yes, last week, at the Spanish Embassy. She is really chic, mon ami."

The English voice: "Her dinners are not at all bad. Lots of money, you know, and the count manages the whole establishment, from renting her the apartment of his uncle the Monsignor N—— to selecting the governess of the daughter and the *chef*. Ha! ha! ha!"

The French voice: "Ah, the Count Martellini! And monsieur the husband is at home in America making the money, I suppose. Mon Dieu! how those men over yonder trust their wives! A charming arrangement for the count."

The English voice: "Have you heard the latest rumor? They are actually going off together to the Nile after Christmas. A party is proposed, and that sort of thing, but every one knows that it will result in a dahabéeh to the cataract. Vive l'amour!"

The French voice, changing to a louder key: "Ah, madame is looking so charming to-day!"

Then a soft rustling of silken draperies over the polished floor announced the entrance of Mrs. Denvil, amiable greetings were exchanged, and the gentlemen became deferential and courteous in manner. Buy the respect of the insolent, by all means!

All the same, two birds of prey had wheeled in heavy and sluggish flight over the valley where the grain ripened and the poppies bloomed, uttering their discordant, mocking cry.

Cecilia crouched behind the sofa, bewildered and astonished. What did they mean? She grew hot and cold, her heart throbbed violently, she clinched her little hand. Why had these wicked creatures come here to sing their dreary duet? How their tone changed when the hostess appeared! She experienced the swift, intense

indignation of youth at hypocrisy, ignorant that these voices would sound the same notes in every house to which they gained admission, after the manner of society. Instinct taught her they alluded to her own mother, before the allusion to the Nile voyage, of which she had already heard. Her mamma and the count were going, with some friends, up the Nile after Christmas. Why might not she go also? Her lips quivered resentfully. Only that morning she had found the count in the aviary, petting the birds; she had wound her arms about his neck, and said, "Oh, how beautiful you are! When I have grown as tall and handsome as a woman can be I shall marry you."

The count had showered kisses on her fair hair, and pinched her cheek in his caressing way.

"We need not wait long, carina," he had replied.

Then mamma had appeared on the threshold, a bright spot on each cheek, and that new flash in her eye.

"You are too old for such nonsense, Cecilia. Go back to mademoiselle directly," she had said, in her dry tones.

Cecilia had departed, crest-fallen, mortified, with some vague remembrance of a father who had not thus dismissed her. To be sure, the count had sent her, later in the day, a gift of bonbons as atonement for mamma's snubbing—one of those white satin boots, mounted on a gilded rink skate, from Spillman's, in the Via Condotti. *He* was never cross, only a big playfellow, all amiability, little clever tricks, frolic, easily tyrannized over, and serenely content to spin balls or sift cards all day long for a child's amusement. They had known him two or three years; he was their oldest friend abroad; he came and went at all hours. The count was a great gentleman, too, of princely lineage, easy, graceful, and elegant. How kind he was to interest himself in the Denvils, when they were strangers in a foreign land! The young girl had ample leisure for these reflections in her hiding-place. She whispered to the image, demanding what it thought of these croakers. The world was so beautiful, and people so kind. Then the two visitors were replaced by a bevy of ladies, and amidst the rustlings of more silken draperies on the floor and the taps of heeled shoes, Cecilia heard her mother exclaim:

"What a horrid man! I am always relieved when he departs, and yet one meets him every where. He told me that frightful scandal about Lady B—— (and no doubt it is true, unfortunately) as if he enjoyed the recital."

A moment before Mrs. Denvil had said:

"Going so soon, Major Kettledrum? I am always delighted to see you."

Now the sofa creaked beneath the weight of two dowagers.

"How soon they lose their republican simplicity over here!" said one, sipping a cup of tea.

"Oh, and they say the husband in America would not be presentable—a common sort of man; a carpenter, I believe," retorted the other.

"Hush! A little more sugar, dear Mrs. Denvil. Thanks."

Finally the rustling of dresses and murmur of voices ceased; Cecilia crept out of her retreat unperceived. She no longer sought a niche for San Donato in the salon. It seemed to her that the statue did not belong there. Mademoiselle had a headache; Cecilia ate her supper alone. Heaven had given her the precious gift of a thoughtful consideration for others. She took her own Cologne flask to mademoiselle's room and bathed the sufferer's temples.

"Mademoiselle, did St. Cecilia despise the world?"

"Surely. She was a holy woman."

"Are there any living like her now?"

"God knows," said mademoiselle, with a little bitterness.

Cecilia kissed her governess, and closed the door softly. Her mood was a strange one. She no longer feared her mother. Something had escaped from her nature, as if she had been touched by fire. It was that subtle, perishable essence of being—childhood.

"I will play that I am a ghost, and walk through all the rooms," she said to herself.

Mrs. Denvil found her standing in her dressing-room, calmly regarding her, as she made her toilet for a ball at the Quirinal Palace.

"Why are you not in bed? It is ten o'clock," she said.

Cecilia made no reply. She was gazing at the picture reflected in the cheval-glass of a very pretty woman in cream-tinted satin robe scarcely retained on her dimpled shoulders by a strap, diamonds and pearls twinkling about her throat and in her hair. The face of the mother, round, soft, with small weak chin and bright eyes, appeared more youthful than that of her child at the moment. The dressing-room was littered with a rainbow of colors, wraps, dresses, Cashmere, laces, and jewelry. It smelled of mingled perfumes and singed hair. Beauty, the poodle, lay coiled up in a tiny white ball on a velvet cushion. How fashionable had Mrs. Denvil become! She never drove out or received company without Beauty tucked under her left arm. At length the daughter inquired, in an odd, abrupt way: "Is it very delightful to attend so many balls?"

Mrs. Denvil laughed nervously and adjusted a bracelet.

"I attend very few balls, my dear. You will like the dancing, I dare say, when you come out as a young lady." Her tone was propitiatory, even deprecating.

Cecilia did not smile.

"Why does not papa live here with us?" she pursued, steadily, after a pause.

Mrs. Denvil was a weak woman; she moved uneasily, then took refuge in maternal dignity.

"I am in Europe to educate Jack and yourself. Papa and I make the sacrifice of being separated for your good, and that you may acquire the foreign languages," she explained, in an injured tone.

Cecilia's eyebrows contracted.

"Are there no good schools or governesses, then, in America?"

"Go to bed, you impertinent child!" said Mrs. Denvil, sharply.

She was ruffled, embarrassed, strangely disturbed, by the curious scrutiny of her daughter. She would have kissed her but for that last question. Really it was too much to be asked if there were no schools in America! She gave Cecilia a little tap with her fan, and floated away, a lovely vision of glistening satin and jewels, enveloped in an opera cloak, to be presented to the Princess Margherita.

The self-elected ghost was free to roam through the whole apartment, to shed a few tears, and finally return to the small chamber containing San Donato. She had intended to tell her mother about the image, but the confidence had remained frozen on her lips. She did not go to bed. She was lonely, miserable, and disquieted. What would her mother have said if she knew of the hiding behind the sofa in the salon? Cecilia now rested her arms on the table, and gazed at the little wooden figure. Never had any toy possessed equal interest to her.

Suddenly a great light filled the room, and San Donato vanished. She searched for the lost treasure in dismay, and beheld him enter the door. O, great and glorious San Donato! O, serene and holy San Donato! spurning the guise of the old shop, a thing of wood, and appearing to a lonely, neglected child as a swift, strong angel, with unfolded wings, in all thy wondrous celestial beauty! Cecilia fell on her knees, not daring to lift her eyes to the golden pinions, the head crowned with its aureole of martyrdom; but the glorious shape raised her, the door and walls of her chamber vanished, and with a giddy rush through the dark night, which deprived her of breath, she found herself standing on a globe, a world, upheld by her guardian, as the soul stands in Guido Reni's picture of the Capitol. Her raiment was also white and glistening; great pearls clasped her throat and wrists. She was gravely chidden for touching these in wonder, and then she saw other shapes, resembling San Donato, passing rank behind rank in the clouds.

"These through great affliction came, but they never swerved from duty. Are you afraid?" His voice was like the chimes up in St. Cecilia's campanile ringing for vespers.

"Duty? What does it mean?" cried Cecilia, opening her eyes.

The image stood on the table, and the candle was flaring low in the socket. Her arms were stiff, her body cold—hours must have elapsed. She shivered, a sob burst from her throat, and she sought her bed. Mrs. Denvil returned from her ball at that moment. The dressing-room had been restored to order by the sleepy maid. The lady drew a slip of perfumed note-paper from her glove. Her eyes were very bright, her lips parched. The note implored her, in the most flowery Italian, to consent to the Nile voyage, as the Countess di Moccoli would also go in that case. Mrs. Denvil laughed her carefully acquired little laugh of studied indifference, and glanced at herself in the mirror. She was not too old to be admired, although her daughter was fifteen. The dream of Alfredo, Count Martellini, was to make a Nile voyage in her company. People would talk, of course. People always talk scandal about somebody. The pretty woman, with her insatiable vanity, was already drifting on a rapid current from which there was no escape. Well, she was not alone. All the gay ladies and men of her acquaintance were also afloat on the same perilous stream. By-and-by they would reach the Niagara brink; then, with a dash and a plunge, all would be over. The end? They would have lived, drained the goblet, and flung it away. When it is fashionable to exaggerate sentiment in every phase, women of Mrs. Denvil's type, fond of luxury and extravagance, intoxicated with dissipation in foreign cities, do not place themselves in the rear ranks.

She tore the note into bits, and smiled again in the mirror. A pale light passed over the glass surface, blue and ghostly; the reflected face grew haggard; patches of rouge stood out on the cheeks; dark shadows gathered beneath the eyes; even the careful coiffure was dishevelled; a stain of wine was visible on the satin gown; powder became glaringly apparent on the dimpled shoulder. The enemy was dawn of a day destined to mark the crisis in Augusta Denvil's life. She shrank from it, without knowing why, and drew the heavy curtains.

Five o'clock on the Pincian Hill, with the setting sun casting its ruddy rays over the city spires and roofs. The band was playing, the carriages wending slowly up the drive, the children darting about the flower beds, where the fountain sparkled. Mrs.

Denvil's maroon liveries and spirited horses had already made the circuit, the lady in pale turquois blue betraying none of the fatigue of dawn, and receiving complacently that homage of admiration which Italy never fails to bestow on an attractive woman in a fine equipage. The Countess di Moccoli had left her own phaeton for a seat beside Mrs. Denvil—an attention the most gratifying in public—to discuss the Nile voyage. Also the Count Martellini, in faultless attire, a jasmine blossom in his buttonhole, and yellow gloves, having assisted at this exchange, had consented to take a seat opposite the two ladies. He seldom drove with Mrs. Denvil. The count punctiliously observed appearances. He did not dislike the circulation of a rumor which elected him as the devoted cavalier of the rich American lady—a position which kept other men at a distance.

Cecilia darted forward from a sheltered path and laid her hand on the carriage door. Her look was troubled and perplexed. Suspicion had taken no positive form in her mind; she was merely striving to read San Donato's message, which had haunted her memory all day: "These through great affliction came, but they never swerved from duty. Are you afraid?"

"Mamma, come home with me!" she cried, clinging to the door.

"You here, Cecilia!" the mother exclaimed.

"Yes; come home," she reiterated.

"You must sit beside me and take a drive instead," interposed the count, quick to avert a scene.

"No; do not touch *me*," said Cecilia, her large eyes flashing.

"Jealousy," thought the Countess di Moccoli.

Mrs. Denvil shook her finger playfully at the intruder, and resumed her conversation. She supposed mademoiselle was back among the trees. Mademoiselle was at home; Cecilia had run away from her to follow her mamma. This was the girl's reading of San Donato's message. She drew back, hurt and offended. She had failed. The slight childish form crossed to the parapet, and stood there, looking down on the Piazza del Popolo, where the pedestrians were dwarfed to pigmies. She thought of her absent father, who represented ever an earthly providence to her, by reason of mademoiselle's admonition, the supply of pin-money, and the letters she wrote under dictation. She idealized this distant yet benign influence. Behind her the crowd increased, the music rose and fell, the carriages moved rapidly past each other in a maze of wheels. On the horizon the red ball of a sun dipped, shedding a tremulous rosy mist over St. Peter's dome.

Cecilia turned, saw her mother's landau again approaching, yielded to a childish impulse, and ran toward it, repenting of her rudeness to the count. He had always been so gentle, so tender, with her, from the first. Her eyes were fixed on the maroon liveries; she strove to attract the count's notice, approached the brink of gliding vehicles, then her foot slipped on the freshly sprinkled gravel; she fell, and the carriage passed over her.

A little heap lay in the road; other horses were reined in furiously, not to trample on it as well. The American lady had run over her own child. That blood-curdling shriek of horror! that jolt on a soft yielding substance was the passage of her wheels on her flesh, the additional weight of stout Countess di Moccoli and of Count Martellini aiding, if possible, in crushing out a fragile existence.

Later the count was confronted by a white, stricken woman. He was full of sympathy and pity for his playmate; tears stood in his beautiful eyes.

"Leave us alone!" she said, fiercely, even wildly.

The count shrugged his shoulders, frowned, and departed. Palpable injustice in the capricious creature, woman. He was a philosopher, and appeared at a diplomatic reception that evening. Matters might have been worse. As a sentimentalist he had made as much love as he dared to a pretty married woman whose husband was absent, while she was manifestly flattered by his attentions. Practically speaking, he, as an impoverished noble, had reaped advantage from his place as habitué of the circle of a rich American in a land where a nice percentage exists on custom. He had directed the money of Henry Denvil into those channels of expenditure which would benefit himself by skillful advice. The Nile voyage would set the world wholly at defiance.

Stout, good-natured Countess di Moccoli also appeared at the diplomatic reception that evening, and we may rest assured no mention was made of a young girl having been run over at the Pincio in the gilded salons where both moved. One does not mention illness and death in gilded salons, amidst the ripple of music and laughter. One frequents these resorts to forget, if possible, such grim and ghastly realities.

Thus closed the 23d of November, 18—.

II.

"The house rests not on the earth, but on the wife."
—*Servian Proverb.*

Mr. Henry Denvil arose at ten o'clock on the morning of the 24th of November. His head ached; his recollections of the previous evening were confused, further than a conviction that he had partaken of a Champagne supper at the hotel, and played cards for money afterward with Jacques

Robin and his wife. A man must occupy his evenings in some way.

The habits of earlier life were still sufficiently strong to render him ashamed of having slept until ten o'clock. He drank his coffee hastily, pressed his slouch hat down over his brow, and did not glance at the hotel as he walked along the village street to the foundry. Eyes were watching him from a window of that same hotel, however—keen eyes, given to studying the world for their own ends, and which now observed the figure and gait of Henry Denvil as he passed with a certain speculative interest. These eyes belonged to a woman, plain, no longer young, her sole attractions a soft voice and pleasing manner; and a small, meagre man, wiry as a grasshopper, with gray hair, a yellow skin, large nose, and a peevish mouth. In the faces of both husband and wife was a hungry, pinched look. Years of poverty sometimes sets such a seal on the human countenance.

This couple were Monsieur Jacques Robin and his wife, emigrants from Heaven knows what past life in their native land, and now dwelling drearily, it must be confessed, in the one tavern of Foundryville—a mere hamlet back among the mountains of Pennsylvania. A year previously Monsieur Robin had applied for the post of clerk in the foundry, and obtaining the modest situation, madame had subsequently appeared on the scene. If existence had been dull for Mrs. Denvil up here among the hills, how much more so was it likely to prove for a woman of Madame Robin's abilities! She took to studying Henry Denvil, and her sky cleared. She knew every particular of his history and family before he even saw her. When he did observe her, Madame Robin made no impression on him beyond being genteel and modest in appearance. Wait! A foreigner soured by poverty, endowed by nature with artfulness, knowledge of humanity in its baser aspects, a certain feline patience, may achieve much in a hamlet among the hills.

On this morning Monsieur Robin had run up from the foundry with a letter for his wife. She read it eagerly.

"It is as I thought!" she exclaimed. "Gustave was always clever at discovery. He has managed to communicate with Mrs. Denvil's own maid at Rome, and learned enough. She will always make excuse to live in Europe, the people flatter her, and she is already much talked about as having fallen in love with the Roman Count Martellini."

"Well?" said the husband, doubtfully, irritably.

"I tell you I have them *all* here in the palm of my hand," retorted madame, with kindling excitement. "In another year I shall be installed as housekeeper in the proprietor's house. You will not only amuse him with cards in the evening, but gain his confidence. Chut! There are secrets to be sold in business to rival houses if necessary. He is a stupid man, without intimate friends, and wholly unsuspicious. He is no match for us. If madame deserts her home for Paris and Rome, ma foi! it is *our* opportunity."

The speaker's dark face flushed, and her eyes glittered. Monsieur Robin returned to the foundry with his figure rather more erect than usual. Feminine enthusiasm is frequently contagious.

In the mean while Henry Denvil had reached his place of business. The European mail also brought him a letter from his wife, inclosing another from his little Cecilia. In this home correspondence Mrs. Denvil always dwelt on the development of her children. Was she not living abroad to educate them? Was she not wintering in Rome to benefit Cecilia's delicate throat? For this end she required more and more money.

Mr. Denvil read his daughter's note first, and smiled at the request that he should come to Rome for Christmas-day. Then he leaned his head on his hand, and tapped his desk with his penknife, absently. How the years slipped away! What had he to anticipate in the clouded future? Would these children, now receiving a foreign education, ever return contentedly to live at Foundryville? Well, they were Augusta's children, and she was an ambitious mother. He made no complaint at the prolonged absence of his family; he was used to it. He never failed to send the required remittances. "The money belongs to Augusta," he always said to himself. Besides, his own expenses were small. One by one the rooms of his large house had been closed through disuse, and a half-grown boy waited on him in the wing. Dust had settled on the rich furniture ordered years ago with such pride to make a fitting nest for his bride; rust gnawed the mute strings of his daughter's piano; the conservatory had been abandoned; the garden was neglected. Henry Denvil had never been an epicure; now he lived from hand to mouth.

Seventeen years before, he had arrived at Foundryville, a man of forty, who had worked hard for the money he was prepared to invest in the foundry. The death of the previous owner compelled his widow to sell out at a sacrifice. Henry Denvil made a good bargain, instituted energetic reforms in the works, lived altogether at Foundryville, gained the confidence of his miners and "hands" by being one of them, and prospered. His predecessor's widow adjusted the exchange of property in the presence of her daughter Augusta, a beautiful girl of eighteen. Plain Henry Denvil,

accustomed to toil-worn women in calico gowns, was dazzled by the graceful manners, white hands, and elegance of these two fashionable ladies. He fell in love for the first time, was encouraged to pay his addresses, married Augusta, and built the large house at Foundryville. His wife was above him in birth, education, and social position; his mother-in-law, during her lifetime, never permitted him to forget this circumstance.

Augusta accepted his devotion at first very sweetly, as a matter of course, then a little wearily. The climate of Foundryville gave her neuralgia. She spent whole winters at Washington and in Florida. He could not leave his business for a day without anxiety. The master's hand must never relax its hold of the helm. He was a proud husband and father; his own nature, sound to the core, accepted without thought of self-sacrifice the enjoyment of his wife in travel. He knew nothing of society, or of the world in which she lived at present. That he placed his family in the peril of evil association in Europe, without himself there as the natural protector, had not once occurred to his mind. Like all men who have earned their own fortune, his first aim had been to bestow on his son and daughter those advantages of study in which his own youth had been deficient. Hence his acquiescence in the plan of sending Jack to Switzerland and Cecilia to Paris, Dresden, or Rome. Mrs. Denvil's arguments in favor of this arrangement had prevailed. Would not the children have been sent away from Foundryville in any case?

The foundry absorbed his day as the great furnace devoured its fuel. As for his evenings? He was not a reading man; his home was silent and dull. He had acquired the habit of dropping in at the tavern and playing cards with his clerk, M. Jacques Robin. He learned many new games, écarté, baccarat, rouge et noir, among the number. The diversion amused him. Often he found himself speculating as to a mistake made the previous evening in the midst of daily business, or a different plan of playing a winning card the ensuing night.

When the hearth-stone is cold, a man seeks forgetfulness elsewhere.

The character of Henry Denvil was on the verge of rapid deterioration. He failed to perceive it. He was puzzled to account for having lost so much money in so short a space of time. That was all. Instinct was at work in the little community, the foundry, where swarthy creatures with bared arms flitted like demons about the great furnace, moulding the fused metal into shapes. These found leisure to curse the "sneaking Frenchman" at the hotel; but the imprecations were gathered up in the whirl and clash of machinery, the din of bells, the hoarse shouting of many voices, and went no further. Outside, the hills towered high above the little hamlet, and the river foamed along the valley. The world was very remote.

"Come to Rome for Christmas," mused Henry Denvil, still resting his head on his hand, and idly scrawling figures on the back of the letter with a pencil.

The request stung him to the quick. He was not needed to complete the happiness of a Roman Christmas. Was not Madame Robin always *so* interested to hear about Cecilia? This poor mother had once possessed such a daughter. From these conversations invariably resulted doubt, cynicism, depression. Would his family dwell in peace at dull Foundryville? Alas! no. The coming years were as blank in prospect as was the present in reality, under the subtle suggestions of Madame Robin's sympathy.

M. Jacques Robin quitted his desk in the corner of the office and approached on tiptoe. Henry Denvil had drawn a card, the ace of diamonds, on the back of his daughter's letter. M. Robin smirked.

"If you are disengaged at eight o'clock, I should like to show you another game," he said, in a discreet and respectful tone.

"Yes," assented the master, moodily.

The November night settled gloomily on Foundryville. Mist swathed the hill-tops and rolled along the slopes, the rain fell monotonously, and the river, invisible in the darkness, mingled its melancholy music with the fitful soughing of the wind. Lights gleamed in the windows of the houses; occasionally a great glare illuminated the whole village; the withered foliage glowed in the shaft of crimson fire; far below, the water twinkled and rippled as if reflecting a conflagration: it was the hour of casting at the foundry, when the chimney belched its volumes of smoke, and the molten iron poured forth in rivulets, like a lava torrent, in the black void of the vast building.

Up in the master's home a single feeble ray was visible in the inhabited wing. Henry Denvil had fallen asleep in his chair. He awoke, looked at his watch, and rose. Eight o'clock. He caught a glimpse of his own face in the glass; it was pale and worn. He resumed his chair. The clock ticked indoors; the rain fell steadily out-of-doors. The lamp had been so placed that its rays fell on a portrait opposite his chair. This portrait represented his daughter Cecilia at the age of ten—a charming blonde head, skillfully treated by the artist, and the large eyes were turned full upon him with a frank intelligence. Henry Denvil was not of an imaginative temperament; his prime had been too fully occupied for idle reveries; but now solitude was rendering him sensitive to morbid influences. When he awoke he became vividly, intensely conscious of

the gaze of this picture fixed on himself. He sat motionless, and studied it, instead of going out. Nine o'clock. A tap at the door, and M. Jacques Robin stood on the threshold, deferential in manner, wet as to garments, having awaited his guest for an hour. Henry Denvil laughed loudly, almost roughly, seized his hat, and sought the village tavern.

The play was reckless that night. The visitor was in the mood for high stakes. Monsieur Robin lost and won without the quiver of an eyelash, or a change of hue in the dull opacity of his complexion. Henry Denvil lost and won with the veins growing knotted and prominent in forehead and temple, and his color deepening from red to crimson. Madame Robin, cool and quiet, crocheted little threads of silk together into a golden mesh with a sharp and slender needle, and from time to time served the gentlemen with wine.

Eleven o'clock. Some person tapped Henry Denvil on the shoulder. He glanced up impatiently, with blood-shot eyes. The landlord of the tavern gave him a telegram, while the official who had brought it waited at the door. He read:

"Come to us immediately. Cecilia has been run over. Tell me what to do. AUGUSTA DENVIL."

Then he was standing outside in the dark night, the rain, chill and dreary as destiny, beating on his bare head, while the clouds rolled low, and the river sent up its murmur from the valley below. His little girl would be dead, he felt convinced, before he could reach her.

III.

"The nest of the blind bird is made by God."—*Armenian Proverb.*

Christmas-day at Rome, as cold and crisp as any Northern festival, with a piercing Tramontane wind sweeping across the piazze, the Alban Hills snow-crested, as if cut in alabaster, and the fountains fringed with icicles.

A gay and brilliant Christmas for a holiday world, with roses blooming still in sheltered nooks; a devout Christmas for those prepared to read its beautiful meaning in ancient churches, each of which had found a voice in full choral harmonies on this day; a Christmas of silent and devout thankfulness for those escaped the shadow of death.

Cecilia Denvil had been hovering on the border-land of feverish delirium, where all is unreal, for weeks. Since the afternoon when the carriage wheels of her mother had passed over her, the present had been blotted out. She was in her own home once more, she raved of her father, her pet birds, the garden. When fever consumed her she was in the foundry, the lava torrent of metal from the furnace mouth creeping nearer and nearer, threatening to ingulf her. Gradually this tumult of restless imagery subsided to a great calm. She wandered with San Donato, the mighty angel, in fields of lilies so vast that they seemed a sea of bloom. Then she became painfully aware of other shapes that bent over her, touched her. A man and a woman met at her side and clasped hands; their faces were vaguely familiar. Rome had vanished, been obliterated; she only wandered among the lilies, guided by a glorious angel, his robe rose-colored, with margin of gold, and a palm branch in his hand. Certainly she must have passed away to another world.

Henry Denvil, on receipt of that telegram, had left Foundryville by the first train, overtaken an outward-bound steamer by means of a small boat, and traversed England and France without delay. Arrived at the apartment in Rome which bore his wife's name, he was met by her, a pale, distraught creature, who clung to him with hysterical sobs, and searched his face with anxious, terrified eyes.

"Is she dead?" he faltered, hoarsely.

"Oh no; but the surgeons think her limbs will be always useless, and she a cripple."

He soothed, but put her aside to seek his child instead. Augusta Denvil was conscious, for the first time, of a dull pang of jealousy. In the long and painful days which ensued Henry Denvil had eyes and thoughts only for Cecilia, while the latter, by one of those curious instincts of illness, would accept nothing from another hand after his arrival.

The mother's ordeal began earlier, and her waning youth had shrivelled in the anguish she was then compelled to endure. Cecilia, from the first, had been deaf to her mother's most tender tones, winced and screamed at the touch of her fingers, even when lying with closed eyes. Mrs. Denvil, in the awful and solemn watches of the night, read in this aversion the doom of retribution. Her spirit succumbed in the trial. The girl's foot might indeed have slipped and she been run over any where. True, but by her own mother's wheels!

Christmas morning, so glorious and bright without, was gray and sober within this apartment of a family of strangers, where each face bore evidence of watching, care, grief.

Cecilia opened her eyes and glanced about her. She was lying on her own bed in her little chamber at Rome, only some sharp sword-thrust of circumstance had wholly severed her from the past. Her face was calm, almost solemn in expression. It seemed natural that her father should be sitting beside her holding her hand and striving to speak cheerfully. She was not startled by the fact that brother Jack stood at the foot of the bed. She noticed, entirely without responsive emotion, that her mother had concealed her face on father's shoulder,

shaken by uncontrollable sobs. Her first words were:

"Where is San Donato?"

Her family failed to understand her. Mademoiselle Durand, also tremulous and in tears, heard and hastened away to her own room. She returned with the little image.

"It is her fancy," murmured the governess.

Cecilia indicated by a gesture that it was to be placed in her father's hands. Mr. Denvil held it carefully, while the invalid gazed steadfastly at her saint. They waited for her next words in silence and suspense. The joy of a convalescent is seldom demonstrative. She did not speak again for an hour. Then she exclaimed suddenly, in stronger tones:

"It is Christmas-day, and papa has come."

Henry Denvil bent over and kissed the wasted little face, praying in his heart it might only be spared to him.

Jack looked on, stiff and ill at ease, after the manner of boys in a sick-chamber. He answered his father's inquiries in constrained and difficult English, with frequent lapses into French. Four years in a Swiss school had wrought wonders for Jack, especially as his mother had left him to take walking tours with his tutors during the summer vacations. A foreign education had been Mrs. Denvil's idea of preparation for life as an American citizen, especially at Foundryville.

There was another lapse into stillness before Cecilia's voice became again audible.

"If I had not—met with the accident on the Pincio, *would* you have come to Rome for Christmas?"

"I fear not, my child."

"Are we to go home with you now?"

"Yes."

Cecilia smiled and closed her eyes. Did she thus understand San Donato's message at last?

Madame Robin will not be installed as housekeeper in the master's house. In the future, Mrs. Denvil, with the reaction of a shallow nature, may make trips to better climates for her neuralgia, or Jack be absent at college; but Henry Denvil—nay, the very foundry—can not be more constant to the spot than his daughter. There will be no balls for her, clad in satin, pearls and diamonds twinkling in her hair and about her throat, no dancing days, no début in society as an heiress. Instead, Cecilia will flit from room to room of the long silent home in a wheel-chair, a presence bright, cheerful, watchful, now pausing in the sunny conservatory where each unfolding flower seems aware of her presence, now awaiting the father's return from work.

Above the entrance door will be enshrined the image of San Donato, guardian of the home, whose mission is to avert evil.

THE RETURN OF THE NATIVE.

BOOK FIFTH.

Contains the natural effects of the foregoing misadventure, namely, contrition in one quarter; in another, an awakening to harrowing discoveries; hasty action thereupon; and what ensued before milder intentions could take effect.

CHAPTER IX.

SIGHTS AND SOUNDS DRAW THE WANDERERS TOGETHER.

HAVING seen Eustacia's signal from the hill at eight o'clock, Wildeve immediately prepared to assist her in her flight. He was somewhat perturbed, and his manner of informing Thomasin that he was going on a journey was in itself sufficient to rouse her suspicions. When she had gone to bed he collected the few articles he would require, and went up stairs to the money-chest. Eustacia, he knew, could go nowhere without money, and suspecting that the secrecy of her departure would prevent her being well provided, he determined to hand over to her as much as he could spare. This was a tolerably bountiful sum in notes, which had been advanced to him on the property he was so soon to have in possession, to defray expenses incidental to the removal.

He then went to the stable and coach-house to personally assure himself that the horse, gig, and harness were in a fit condition for a long drive. Nearly half an hour was spent thus, and on returning to the house Wildeve had no thought of Thomasin being any where but in bed. He had told the stable-lad not to stay up, giving the boy to understand that his departure would be at three or four in the morning; for this, though an exceptional hour, was less strange than midnight, the time actually agreed on. Wildeve had thought of telling the whole story to his wife; but he feared its effect upon her, and resolved not to explain till forced to do so on his return, when all would be over, and the facts themselves, however peculiar, would testify that no scheme for a combined elopement had been afoot.

At last all was quiet, and he had nothing to do but to wait. By no effort could he shake off the oppression of spirits which he

had experienced ever since his last meeting with Eustacia. There was that in his situation which money could not cure. He had persuaded himself that to act honestly toward his gentle wife and chivalrously toward another woman was not only possible but easy; he had resolved to regulate his conduct by canons of virtue, and blind himself to his sentiments for Eustacia in lending her assistance; but, even while he endeavored, the spell that she had cast over him intensified. To-night, though he meant to adhere to her instructions to the letter, to deposit her where she wished, and to leave her when she chose, his heart was beating fast in the anticipated pleasure of seeing her.

He would not allow himself to dwell long upon this contradiction of his maxims by his hopes, and at twenty minutes to twelve he again went softly to the stable, harnessed the horse, and lit the lamps; and taking the horse by the head, led him with the covered car out of the yard to a spot by the road-side some forty or fifty paces below the inn.

Here Wildeve waited, slightly sheltered from the driving rain by a high bank that had been cast up at this place. Along the surface of the road where lit by the lamps the loosened gravel and small stones scudded and clicked together before the wind, which, leaving them in heaps, plunged into the heath, and boomed across the bushes into darkness. Only one sound rose above this din of weather, and that was the roaring of a ten-hatch weir a few yards further on, where the road approached the river which formed the boundary of the heath in this direction.

He lingered on in perfect stillness, till he began to fancy that the midnight hour must have struck. A very strong doubt had arisen in his mind if Eustacia would venture down the hill in such weather; yet knowing her nature, he feared that she might persist. "Poor thing; 'tis like her ill luck," he murmured.

At length he turned to the lamp and looked at his watch. To his surprise it was nearly a quarter past midnight. He now wished that he had driven up the circuitous road to Mistover—a plan not adopted because of the enormous length of the route in proportion to that of the pedestrian's path down the open hill-side, and the consequent increase of labor for the horse.

At this moment a footstep approached, but the light of the lamps being in a different direction, the comer was not visible. The step paused, then came on again.

"Eustacia?" said Wildeve.

The person came forward, and the light fell upon the form of Clym, glistening with wet, whom Wildeve immediately recognized; but Wildeve, who stood behind the lamp, was not at once recognized by Yeobright.

He stopped as if in doubt whether this waiting vehicle could have any thing to do with the flight of his wife or not. The sight of Yeobright at once banished Wildeve's sober feelings, who saw him again as the deadly rival from whom Eustacia was to be kept at all hazards. Hence Wildeve did not speak, in the hope that Clym would pass by without particular inquiry.

While they both hung thus in hesitation a dull sound became audible above the storm and wind. Its origin was unmistakable—it was the fall of a body into the stream adjoining, apparently at a point near the weir.

Both started. "Good God! can it be she?" said Clym.

"Why should it be she?" said Wildeve, in his alarm forgetting that he had hitherto screened himself.

"Ah!—that's you, you traitor, is it?" cried Yeobright. "Why should it be she? Because last week she would have put an end to her life if she had been able. She ought to have been watched! Take one of the lamps and come with me."

Yeobright seized the one on his side, and hastened on; Wildeve did not wait to unfasten the other, but followed at once along the road to the weir, a little in the rear of Clym.

Shadwater Weir had at its foot a large circular pool, fifty feet in diameter, into which the water flowed through ten huge hatches, raised and lowered by a winch and cogs in the ordinary manner. The sides of the pool were of masonry, to prevent the water from washing away the bank; but the force of the stream in winter was sometimes such as to undermine the retaining-wall, and precipitate it into the hole. Clym reached the hatches, the whole frame-work of which was shaken to its foundations by the velocity of the current. Nothing but the froth of the waves could be discerned in the pool below. He got upon the plank bridge over the race, and, holding to the rail that the wind might not blow him off, crossed to the other side of the river. There he leaned over the wall and lowered the lamp, only to behold the vortex formed at the curl of the returning current.

Wildeve meanwhile had arrived on the other side, and the light from Yeobright's lamp shed a flecked and agitated radiance across the weir pool, revealing the tumbling courses of the currents from the hatches above. Across this gashed and puckered mirror a dark body was slowly borne by one of the backward currents.

"Oh, my darling!" exclaimed Wildeve, in an agonized voice; and without showing sufficient presence of mind even to throw off his great-coat, he leaped into the boiling hole.

Yeobright could now also discern the floating body, though but indistinctly; but

imagining from Wildeve's plunge that there was life to be saved, he was about to leap after. Suddenly bethinking himself of a wiser plan, he placed the lamp against a post to make it stand upright, and running round to the lower part of the pool where there was no wall, he sprang in and boldly waded upward toward the deeper portion. Here he was instantly taken off his legs, and in swimming was carried round into the centre of the basin, where he perceived Wildeve already struggling.

While these hasty actions were in progress here, Venn and Thomasin had been toiling through the lower corner of the heath in the direction of the light. They had not been near enough to the river to hear the plunge, but they saw the removal of the carriage lamp, and watched its motion down the road. As soon as they reached the car and horse, Venn guessed that something new was amiss, and hastened to follow in the course of the moving light. Venn walked faster than Thomasin, and came to the weir alone.

The lamp placed against the post by Clym still shone across the water, and the reddleman observed something floating motionless. Being encumbered with the infant, he instantly ran back to meet Thomasin.

"Take the baby, please, Mrs. Wildeve," he said, hastily. "Run home with her, call the stable-lad, and make him send down to me any men who may be living near. Somebody has fallen into the weir."

Thomasin took the child and ran. When she came to the covered car, the horse, though fresh from the stable, was standing perfectly still, as if conscious of misfortune. She saw for the first time whose it was. She nearly fainted, and would have been unable to proceed another step but that the necessity of preserving the little girl from harm nerved her to an amazing self-control. In this agony of suspense she entered the house, put the baby in a place of safety, woke the lad and the female domestic, and ran out to give the alarm at the nearest cottage.

Diggory, having returned to the brink of the pool, observed that the small upper hatches or floats were withdrawn. He found one of these lying upon the grass, and taking it under one arm, and with his lantern in his hand, entered at the bottom of the pool as Clym had done. As soon as he began to be in deep water he flung himself across the hatch, and thus supported was able to keep afloat as long as he chose, holding the lantern aloft with his disengaged hand. Propelled by his feet, he steered round and round the pool, ascending each time by one of the back streams, and descending in the middle of the current.

At first he could see nothing. Then, amidst the glistening of the whirlpools and the white clots of foam, he distinguished a woman's bonnet floating alone. His search was now under the left wall, when something came to the surface almost close beside him. It was not, as he had expected, a woman, but a man. The reddleman put the ring of the lantern between his teeth, seized the floating man by the collar, and holding on to the hatch with his remaining arm, struck out into the strongest race, by which the unconscious man, the hatch, and himself were carried with the speed of an arrow down the stream. As soon as Venn found his feet dragging over the pebbles of the shallower part below, he secured his footing and waded toward the brink. There, where the water stood at about the height of his waist, he flung away the hatch, and attempted to drag forth the man. This was a matter of great difficulty, and to his surprise he found as the reason that the legs of the unfortunate stranger were tightly embraced by the arms of another man, who had hitherto been entirely beneath the surface.

At this moment his heart bounded to hear footsteps running toward him, and two men, roused by Thomasin, appeared at the brink above. They ran to where Venn was, and helped him in lifting out the apparently drowned persons, separating them, and laying them out upon the grass. Venn turned the light upon their faces. The one who had been uppermost was Yeobright; he who had been completely submerged was Wildeve.

"Now we must search the hole again," said Venn. "A woman is in there somewhere. Get a pole."

One of the men went to the foot-bridge and tore off the hand-rail. The reddleman and the two others then entered the water together from below as before, and with their united force probed the pool forward to where it sloped down to its central depth. Venn was not mistaken in supposing that any person who had sunk for the last time would be washed down to this point, for when they had examined to about half-way across, something impeded their thrust.

"Pull it forward," said Venn; and they raked it in with the pole till it was close to their feet.

Venn vanished under the stream, and came up with an armful of wet drapery inclosing a woman's cold form, which was all that remained of the desperate and unfortunate Eustacia.

When they reached the bank, there stood Thomasin, in an agony of grief, bending over the two unconscious ones who already lay there. The horse and car were brought to the nearest point in the road, and it was the work of a few minutes only to place the three in the vehicle. Venn led on the horse, supporting Thomasin upon his arm, and the two men followed, till they reached the inn.

The woman who had been shaken out of her sleep by Thomasin had hastily dressed herself and lighted a fire, the other servant being left to snore on in peace at the back of the house. The insensible forms of poor Eustacia, Clym, and Wildeve were then brought in and laid on the carpet with their feet to the fire, when such restorative processes as could be thought of were adopted at once, the stable-man being in the mean time sent for a doctor. But there seemed to be not a waft of life left in either of the unfortunates. Then Thomasin, whose stupor of grief had been thrust off a while by frantic action, applied a bottle of hartshorn to Clym's nostrils, having tried it in vain upon the other two. He sighed.

"Clym's alive!" she exclaimed.

He soon breathed distinctly, and again and again did she attempt to revive her husband by the same means; but Wildeve gave no sign. There was too much reason to think that he and Eustacia both were forever beyond the reach of stimulating perfumes. Their exertions did not relax till the doctor arrived, when, one by one, the senseless three were taken up stairs and put into warm beds.

Venn soon felt himself relieved from further attendance, and went to the door, scarcely able yet to realize the strange catastrophe that had befallen the family in which he took so great an interest. Thomasin surely would be broken down by the sudden and overwhelming nature of this event. No firm and sensible Mrs. Yeobright lived now to support the gentle girl through the ordeal; and whatever an unimpassioned spectator might think of her loss of such a husband as Wildeve, there could be no doubt that for the moment she was distracted and horrified by the blow. As for himself, not being privileged to go to her and comfort her, he saw no reason for waiting longer in a house where he remained only as a stranger.

He returned across the heath to his van. The fire was not yet out, and every thing remained as he had left it. Venn now bethought himself of his clothes, which were saturated with water to the weight of lead. He changed them, spread them before the fire, and lay down to sleep. But it was more than he could do to rest here while excited by a vivid imagination of the turmoil they were in at the house he had quitted, and, blaming himself for coming away, he dressed in another suit, locked up the door, and again hastened across to the inn. Rain was still falling heavily when he entered the kitchen. A bright fire was shining from the hearth, and two women were bustling about, one of whom was Olly Dowden.

"Well, how is it going on now?" said Venn, in an anxious whisper.

"Mr. Yeobright is better; but Mrs. Yeobright and Mr. Wildeve are dead and cold. The doctor says they were quite gone before they were out of the water."

"Ah! I thought as much when I hauled 'em up. And Mrs. Wildeve?"

"She is as well as can be expected. The doctor had her put between blankets, for she was almost as wet as they that had been in the river, poor young thing. You don't seem very dry, reddleman."

"Oh, 'tis not much. I have changed my things. This is only a little dampness I've got coming through the rain again."

"Stand by the fire. Mis'ess says you be to have whatever you want, and she was sorry when she was told that you'd gone away."

Venn drew near to the fire-place, and looked into the flames in an absent mood. The steam came from his leggings and ascended the chimney with the smoke, while he thought of those who were up stairs. Two were corpses, one had barely escaped the jaws of death, another was sick and a widow. The last occasion on which he had lingered by that fire-place was when the raffle was in progress, when Wildeve was alive and well, Thomasin active and smiling in the next room, Yeobright and Eustacia just made man and wife, and Mrs. Yeobright living at Blooms End. It had seemed at that time that the then position of affairs was good for at least twenty years to come. Yet of all the circle he himself was the only one whose situation had not materially changed.

While he ruminated, a footstep descended the stairs. It was the nurse, who brought in her hand a rolled mass of wet paper. The woman was so engrossed with her occupation that she hardly saw Venn. She took from a cupboard some pieces of twine, which she strained across the fire-place, tying the end of each piece to the fire-dog previously pulled forward for the purpose, and, unrolling the wet papers, she began pinning them one by one to the strings in the manner of clothes on a line.

"What be they?" said Venn.

"Poor master's bank-notes," she answered. "They were found in his pocket when they undressed him."

"Then he was not coming back again for some time?" said Venn.

"That we shall never know," said she.

Venn was loath to depart, for all on earth that interested him lay under this roof. As nobody in the house had any more sleep that night, except the two who slept forever, there was no reason why he should not remain. So he retired into the niche of the fire-place where he had used to sit, and there he continued, watching the steam from the double row of bank-notes as they waved backward and forward in the draught of the chimney till their flaccidity was changed to

dry crispness throughout. Then the woman came and unpinned them, and folding them together, carried the handful up stairs. Presently the doctor appeared from above, with the look of a man who could do no more, and pulling on his gloves, went out of the house, the trotting of his horse soon dying away upon the road.

At four o'clock there was a gentle knock at the door. It was from Charley, who had been sent by Captain Drew to inquire if any thing had been heard of Eustacia. The girl who admitted him looked in his face as if she did not know what answer to return, and showed him in to where Venn was seated, saying to the reddleman, "Will you tell him, please?"

Venn told. Charley's only utterance was a feeble, indistinct sound. He stood quite still; then he burst out spasmodically: "I shall see her once more?"

"I dare say you may see her," said Diggory, gravely. "But hadn't you better run and tell Captain Drew?"

"Yes, yes. Only I do hope I shall see her just again."

"You shall," said a low voice behind; and starting round, they beheld by the dim light a thin, pallid, almost spectral form, wrapped in a blanket, and looking like Lazarus coming from the tomb.

It was Yeobright. Neither Venn nor Charley spoke, and Clym continued: "You shall see her. There will be time enough to tell the captain when it gets daylight. You would like to see her too, would you not, Diggory? She looks very beautiful now."

Venn assented by rising to his feet, and with Charley he followed Clym to the foot of the staircase, where he took off his boots; Charley did the same. They followed Yeobright up stairs to the landing, where there was a candle burning, which Yeobright took in his hand, and with it led the way into an adjoining room. Here he went to the bedside, and folded back the sheet.

They stood silently looking upon Eustacia, who, as she lay there still in death, eclipsed all her living phases. Pallor did not include all the quality of her complexion, which seemed more than whiteness; it was almost light. The expression of her finely carved mouth was pleasant, as if a sense of dignity had just compelled her to leave off speaking. Eternal rigidity had seized upon it in a momentary transition between fervor and resignation. Her black hair was looser now than either of them had ever seen it before, and surrounded her brow like a forest. The stateliness of look which had been almost too marked for a dweller in a country domicile, had at last found an artistically happy background.

Nobody spoke, till at length Clym covered her and turned aside. "Now come here," he said.

They went to a recess in the same room, and there, on a smaller bed, lay another figure—Wildeve. Less repose was visible in his face than in Eustacia's, but the same luminous youthfulness overspread it, and the least sympathetic observer would have felt at sight of him now that he was born for a higher destiny than this. The only sign upon him of his recent struggle for life was in his finger-tips, which were worn and scarified to the bone in his dying endeavors to obtain a hold on the face of the weir wall.

Yeobright's manner had been so quiet, he had uttered so few syllables since his re-appearance, that Venn imagined him resigned. It was only when they had left the room and stood upon the landing that the true state of his mind was apparent. Here he said, with a wild smile, inclining his head toward the chamber in which Eustacia lay, "She is the second woman I have killed this year. I was a great cause of my mother's death; and I am the chief cause of hers."

"How?" said Venn.

"I spoke cruel words to her, and she left my house. I did not invite her back till it was too late. It is I who ought to have drowned myself. It would have been a charity to the living had the river overwhelmed me and borne her up. But I can not die. Those who ought to have lived lie dead, and here am I alive!"

"But you can't charge yourself with crimes in that way," said Venn. "You may as well say that the parents be the cause of a murder by the child, for without the parents the child would never have been begot."

"Yes, Venn, that is very true; but you don't know all the circumstances. If it had pleased God to put an end to me, it would have been a good thing for all. But I am getting used to the horror of my existence. They say that a time comes when men laugh at misery through long acquaintance with it. Surely that time will soon come to me."

"Your aim has always been good," said Venn. "Why should you say such desperate things?"

"No, they are not desperate. They are only hopeless; and my great regret is that for what I have done no man can punish me."

BOOK SIXTH.

Shortly relates the gradual righting of affairs after the foregoing catastrophe, and how there resulted another general gathering at Blooms End; with which, and a few other particulars, the story closes.

CHAPTER I.

THE INEVITABLE MOVEMENT ONWARD.

THE history of the deaths of Eustacia and Wildeve was told throughout Egdon, and far beyond, for many weeks and months. All the known incidents of their love were

enlarged, distorted, touched up, and modified, till the original reality bore but a slight resemblance to the counterfeit presentation by surrounding tongues. Whether Wildeve would have had sufficient ballast of character to return to Thomasin when once in Budmouth with Eustacia may be doubted, but when it was discovered that he had at least intended to return the next day, no allowance was made, and the fact was dismissed as not worthy of reiteration. Yet, upon the whole, neither the man nor the woman lost dignity by sudden death. Misfortune had struck them gracefully, cutting off their young histories with a catastrophic dash, instead of, as with many, attenuating each life to an uninteresting meagreness, through long years of wrinkles, neglect, and decay.

On those most nearly concerned the effect was somewhat different. Strangers, who had heard of many such cases, now merely heard of one more; but immediately where a blow falls, no previous imaginings amount to appreciable preparation for it. The very suddenness of her bereavement dulled, to some extent, Thomasin's feelings; yet, irrationally enough, a consciousness that the husband she had lost ought to have been a better man, did not lessen her mourning at all. On the contrary, this fact seemed at first to set off the dead husband in his young wife's eyes, and to be the necessary cloud to the rainbow.

But the horrors of the unknown had passed. Vague misgivings about her future as a deserted wife were at an end. The worst had once been matter of trembling conjecture; it was now matter of reason only—a limited badness. Her chief interest, the little Eustacia, still remained. There was humility in her grief, no defiance in her attitude; and when this is the case, a shaken spirit is apt to be stilled.

Could Thomasin's mournfulness now and Eustacia's serenity during life have been reduced to common measure, they would have touched the same mark nearly. But Thomasin's former brightness made shadow of that which in a sombre atmosphere was light itself.

The spring came and calmed her; the summer came and soothed her; the autumn arrived, and she began to be comforted, for her little girl was strong and happy, growing in size and knowledge every day. Outward events flattered Thomasin not a little. Wildeve had died intestate, and she and the child were his only relatives. When administration had been granted, all the debts paid, and the residue of her husband's uncle's property had come into her hands, it was found that the sum waiting to be invested for her own and the child's benefit was little less than nine thousand pounds.

Where should she live? The obvious place was Blooms End. The old rooms, it is true, were not much higher than the between-decks of a frigate, necessitating a sinking in the floor under the new clock-case she brought from the inn, and the removal of the handsome brass knobs on its head, before there was height for it to stand in; but, such as the rooms were, there were plenty of them, and the place was endeared to her by every early recollection. Clym very gladly admitted her as a tenant, confining his own existence to two rooms at the top of the back staircase, where he lived on quietly, shut off from Thomasin and the two servants she had thought fit to indulge in now that she was a mistress of money, going his own ways, and thinking his own thoughts.

His sorrows had made some change in his outward appearance; and yet the alteration was chiefly within. It might have been said that he had a wrinkled mind. He had no enemies, and he could get nobody to reproach him, which was why he so bitterly reproached himself.

He did sometimes think he had been ill used by fortune so far as to say that to be born is a palpable dilemma, and that instead of men aiming to advance with glory, they should calculate how to retreat without shame. But that he and his had been sarcastically and pitilessly handled in having such irons thrust into their souls he did not maintain long. It is usually so, except with the sternest of men. The placable human race, in its generous endeavor to construct a hypothesis that shall not degrade a first cause, has always hesitated to conceive a dominant power of lower moral quality than its own; and, even while it sits down and weeps by the waters of Babylon, invents excuses for the oppression which prompts its tears.

Thus, though words of solace were vainly uttered in his presence, he found relief in a direction of his own choosing when left to himself. For a man of his habits the house and the hundred and twenty pounds a year which he had inherited from his mother were enough to supply all worldly needs. Resources do not depend upon gross amounts, but upon the proportion of givings to takings.

He frequently walked the heath alone, when the past seized upon him with its shadowy hand, and held him there to listen to its tale. His imagination would then people the spot with its ancient inhabitants: forgotten Celtic tribes trod their tracks around him, and he could almost live among them, look in their faces, and see them standing beside the barrows which swelled around, untouched and perfect as at the time of their erection. Those of the dyed barbarians who had chosen the cultivable tracts were, in comparison with those who had left their marks here, as writers on paper beside writers on parchment. Their

records had perished long ago by the plough, while the works of these remained. Yet they all had lived and died unconscious of the different fates awaiting their works. It reminded him that unconjectured factors operate in the production of immortality.

Winter again came round, with its winds, frosts, tame robins, and sparkling starlight. The year previous Thomasin had hardly been conscious of the season's advance; this year she laid her heart open to external influences of every kind. The life of this sweet cousin, her baby and her servants, came to Clym's senses only in the form of sounds through a wood partition as he sat over books of exceptionally large type; but his ear became at last so accustomed to these slight noises from the other part of the house that he almost could witness the scenes they signified. A faint beat of half-seconds conjured up Thomasin rocking the cradle; a wavering hum meant that she was singing the baby to sleep; a crunching of sand as between millstones raised the picture of Humphrey's, Fairway's, or Sam's heavy feet crossing the stone floor of the kitchen; a light step and a gay tune in a high key betokened a visit from Grandfer Cantle; a sudden break off in the Grandfer's utterances implied the application to his lips of a mug of small beer; a bustling and slamming of doors meant starting to go to market—for Thomasin, in spite of her added scope for gentility, led a ludicrously narrow life, to the end that she might save every possible pound for her little daughter.

One summer day Clym was in the garden, immediately outside the parlor window, which was as usual open. He was looking at the pot-flowers on the sill: they had been revived and restored by Thomasin to the state in which his mother had left them. He heard a slight scream from Thomasin, who was sitting inside the room.

"Oh, how you frightened me!" she said to some one who had entered. "I thought you were the ghost of yourself."

Clym was curious enough to advance a little further and look in at the window. To his astonishment there stood within the room Diggory Venn, no longer a reddleman, but exhibiting the strangely altered hues of an ordinary Christian countenance, white shirt front, light flowered waistcoat, blue-spotted neckerchief, and bottle-green coat. Nothing in this appearance was at all singular but the fact of its great difference from what he had formerly been. Red, and all approaching red, was carefully excluded from every article of clothes upon him, for what is there that persons out of harness dread so much as reminders of the trade which has enriched them?

Yeobright went round to the door and entered.

"I was so alarmed," said Thomasin, smiling from one to the other. "I couldn't believe that he had got white of his own accord. It seemed supernatural."

"I gave up dealing in reddle last Christmas," said Venn. "It was a profitable trade, and I found that by that time I had made enough to take the large dairy of eighty cows that my father had in his lifetime. I always thought of getting to that place again if I changed at all; and now I am there."

"How did you manage to become white, Diggory?" Thomasin asked.

"I turned so by degrees, ma'am."

"You look much better than ever you did before."

Venn appeared confused; and Thomasin, seeing how inadvertently she had spoken to a man who might possibly have tender feelings for her still, blushed a little. Clym saw nothing of this, and added, good-humoredly:

"What shall we have to frighten Thomasin's baby with, now you have become a human being again?"

"Sit down, Diggory," said Thomasin, "and stay to tea."

Venn moved as if he would retire to the kitchen, when Thomasin said, with pleasant pertness, as she went on with some sewing, "Of course you must sit down here. And where does your large eighty-cow dairy lie, Mr. Venn?"

"About two miles to the right of Alderworth, where the meads begin. I have thought that if Mr. Yeobright would like to pay me a visit sometimes, he shouldn't stay away for want of asking. I'll not bide to tea this afternoon, thank ye, for I've got something on hand that must be settled. 'Tis May-pole day to-morrow, and the Shadwater folk have clubbed with a few of your neighbors here to have one just outside your palings in the heath, as it is a nice green place." Venn waved his elbow toward the patch in front of the house. "I have been talking to Fairway about it," he continued, "and I said to him that before we put up the pole it would be as well to ask Mrs. Wildeve."

"I can say nothing against it," she answered. "Our property does not reach an inch further than the white palings."

"But you might not like to see a lot of folk going crazy round a stick, under your very nose."

"I shall have no objection at all."

Venn soon after went away, and in the evening Yeobright strolled as far as Fairway's cottage. It was a lovely May sunset, and the birch-trees which grew on this margin of the vast Egdon wilderness had put on their new leaves, delicate as butterflies' wings, and diaphanous as amber. Beside Fairway's dwelling was an open space recessed from the road, and here were now collected all the young people from within

a radius of a couple of miles. The pole lay with one end supported on a trestle, and women were engaged in wreathing it from the top downward with wild flowers. The instincts of merry England lingered on here with exceptional vitality, and the symbolic customs which tradition has attached to each season of the year were yet a reality on Egdon. Indeed, the impulses of all such outlandish hamlets are pagan still: in these spots homage to nature, self-adoration, frantic gayeties, fragments of Teutonic rites to divinities whose names are forgotten, have in some way or other survived mediæval doctrine.

Yeobright did not interrupt the preparations, and went home again. The next morning, when Thomasin withdrew the curtains of her bedroom window, there stood the May-pole in the middle of the green, its top cutting into the sky. It had sprung up in the night, or rather early morning, like Jack's bean-stalk. She opened the casement to get a better view of the garlands and posies that adorned it. The sweet perfume of the flowers had already spread into the surrounding air, which, being free from every taint, conducted to her lips a full measure of the fragrance received from the spire of blossom in its midst. At the top of the pole were crossed hoops decked with small flowers; beneath these came a milk-white zone of May-bloom, then a zone of bluebells, then of cowslips, then of lilacs, then of ragged-robins, daffodils, and so on, till the lowest stage was reached. Thomasin noticed all these, and was delighted that the May revel was to be so near.

When afternoon came, people began to gather on the green, and Yeobright was interested enough to look out upon them from the open window of his room. Soon after this Thomasin walked out from the door immediately below, and turned her eyes up to her cousin's face. She was dressed more gayly than Yeobright had ever seen her dress since the time of Wildeve's death, eighteen months before; since the day of her marriage even she had not exhibited herself to such advantage.

"How pretty you look to-day, Thomasin!" said Clym. "Is it because of the May-pole?"

"Not altogether." And then she blushed and dropped her eyes, which he did not specially observe, though her manner seemed to him to be rather peculiar, considering that she was only addressing himself. Could it be possible that she had put on her summer clothes to please him?

He recalled her conduct toward him throughout the last few weeks, when they had often been working together in the garden, just as they had formerly done when they were boy and girl under his mother's eye. What if her interest in him were not so entirely that of a relative as it had formerly been? To Yeobright any possibility of this sort was a serious matter; and he almost felt troubled at thought of it. Every pulse of lover-like feeling which had not been stilled during Eustacia's lifetime had gone into the grave with her. His passion for her had occurred too far on in his manhood to leave fuel enough on hand for another fire of that sort, as may happen with more boyish loves. Even supposing him capable of loving again, that love would be a plant of slow and labored growth, and in the end only small and sickly, like an autumn-hatched bird.

He was so distressed by this new complexity that when the enthusiastic brass-band arrived and struck up, which it did about five o'clock, with apparently wind enough among its members to blow down his house, he withdrew from his rooms by the back-door, went down the garden, through the gate in the privet hedge, and away out of sight. He could not bear to remain in the presence of enjoyment to-day, though he had tried hard.

Nothing was seen of him for four hours. When he came back by the same path it was dusk, and the dews were coating every green thing. The boisterous music had ceased, but, entering the premises as he did from behind, he could not see if the May party had all gone till he had passed through Thomasin's division of the house to the front-door. Thomasin was standing within the porch alone.

She looked at him reproachfully. "You went away just when it began, Clym," she said.

"Yes. I felt I could not join in. You went out with them, of course?"

"No, I did not."

"You appeared to be dressed on purpose?"

"Yes, but I could not go out alone; so many people were there. One is there now."

Yeobright strained his eyes across the dark green patch beyond the paling, and near the black form of the May-pole he discerned a shadowy figure sauntering idly up and down. "Who is it?" he said.

"Mr. Venn," said Thomasin.

"You might have asked him to come in, I think, Tamsie. He has been very kind to you first and last."

"I will now," she said; and acting on the impulse, went through the wicket to where Venn stood under the May-pole.

"It is Mr. Venn, I think?" she inquired.

Venn started as if he had not seen her—artful man that he was—and said, "Yes."

"Will you come in?"

"I am afraid that I—"

"I have seen you dancing this evening, and you had the very best of the girls for

your partners. Is it that you won't come in because you wish to stand here and think over the past hours of enjoyment?"

"Well, that's partly it," said Mr. Venn, with ostentatious sentiment. "But the main reason why I am biding here like this is that I want to wait till the moon rises."

"To see how pretty the May-pole looks in the moonlight?"

"No. To look for a glove that was dropped by one of the maidens."

Thomasin was speechless with surprise. That a man who had to walk some four or five miles to his home should wait here for such a reason pointed to only one conclusion: the man must be amazingly interested in that glove's owner.

"Were you dancing with her, Diggory?" she asked, in a voice which revealed that he had made himself considerably more interesting to her by this disclosure.

"No," he sighed.

"And you will not come in, then?"

"Not to-night, thank you, ma'am."

"Shall I lend you a lantern to look for the young person's glove, Mr. Venn?"

"Oh no, it is not necessary, Mrs. Wildeve, thank you. The moon will rise in a few minutes."

Thomasin went back to the porch. "Is he coming in?" said Clym, who had been waiting where she had left him.

"He would rather not to-night," she said, and then passed by him into the house, whereupon Clym, too, retired to his own rooms.

When Clym was gone, Thomasin crept up stairs in the dark, and, just listening by the cot to assure herself that the child was asleep, she went to the window, gently lifted the corner of the white curtain, and looked out. Venn was still there. She watched the growth of the faint radiance appearing in the sky by the eastern hill, till presently the edge of the moon burst upward and flooded the valley with light. Diggory's form was now distinct on the green; he was moving about in a bowed attitude, evidently scanning the grass for the precious missing article, walking in zigzags right and left till he should have passed over every foot of the ground.

"How very ridiculous!" Thomasin murmured to herself, in a tone which was intended to be satirical. "To think that a man should be so silly as to go mooning about like that for a girl's glove! A respectable dairyman, too, and a man of money as he is now. What a pity!"

At last Venn appeared to find it; whereupon he stood up and raised it to his lips. Then placing it in his breast pocket—the nearest receptacle to a man's heart permitted by modern raiment—he ascended the valley in a mathematically direct line toward his distant home in the meadows.

CHAPTER II.

THOMASIN WALKS IN A GREEN PLACE BY THE ROMAN ROAD.

CLYM saw little of Thomasin for several days after this; and when they met she was more silent than usual. At length he asked her what she was thinking of so intently.

"I am thoroughly perplexed," she said, candidly. "I can not for my life think who it is that Diggory Venn is so much in love with. None of the girls at the May-pole were good enough for him, and yet she must ha' been there."

Clym tried to imagine Venn's choice for a moment; but ceasing to be interested in the question, he went on again with his gardening.

No clearing up of the mystery was granted her for some time. But one afternoon Thomasin was up stairs getting ready for a walk, when she had occasion to come to the landing and call "Rachel." Rachel was a girl about thirteen who carried the baby out for airings; and she came up stairs at the call.

"Have you seen one of my last new gloves about the house, Rachel?" inquired Thomasin. "It is the fellow to this one."

Rachel did not reply.

"Why don't you answer?" said her mistress.

"I think it is lost, ma'am."

"Lost? who lost it? I have never worn them but once."

Rachel appeared as one dreadfully troubled, and at last began to cry. "Please, ma'am, on the day of the May-pole I had none to wear, and I seed yours on the table, and I thought I would borrow 'em. I did not mean to hurt 'em at all, but one of them got lost. Somebody gave me some money to buy another pair for you, but I have not been able to go any where to get 'em."

"Who's somebody?"

"Mr. Venn."

"Did he know it was my glove?"

"Yes. I told him."

Thomasin was so surprised by the explanation that she quite forgot to lecture the girl, who glided silently away. Thomasin did not move further than to turn her eyes upon the grass-plat where the May-pole had stood. She remained thinking, then said to herself that she would not go out that afternoon, but would work hard at the baby's unfinished lovely plaid frock, cut on the cross in the newest fashion. How she managed to work hard, and yet do no more than she had done at the end of two hours, would have been a mystery to any one not aware that the recent incident was of a kind likely to divert her industry from a manual to a mental channel.

Next day she went her ways as usual, and continued her custom of walking in the

heath with no other companion than little Eustacia, now of the age when it is a matter of doubt with such characters whether they are intended to walk through the world on their hands or on their feet, and so they get into painful complications by trying both. It was very pleasant to Thomasin, when she had carried the child to some lonely place, to give her a little private practice on the green turf and shepherd's thyme, which formed a soft mat to fall headlong upon when equilibrium was lost.

Once, when engaged in this system of training, and stooping to remove bits of sticks, fern stalks, and other such fragments from the child's path, that the journey might not be brought to an untimely end by some insuperable barrier a quarter of an inch high, she was alarmed by discovering that a man on horseback was almost close beside her, the soft natural carpet having muffled the horse's tread. The rider, who was Venn, waved his hat in the air and bowed gallantly.

"Diggory, give me my glove," said Thomasin, whose manner it was, under any circumstances, to plunge into the midst of a subject which engrossed her.

Venn immediately dismounted, put his hand in his breast pocket, and handed the glove.

"Thank you. It was very good of you to take care of it."

"It was very good of you to let me."

"Oh no. I was quite glad to find you had it. Every body gets so indifferent, that I was surprised to know you thought of me."

"If you had remembered what I was once, you wouldn't have been surprised."

"Ah, no," she said, quickly. "But men of your character are mostly so independent."

"What is my character?" he asked.

"I don't exactly know," said Thomasin, simply, "except it is to cover up your feelings under a practical manner, and only to show them when you are alone."

"Ah, how do you know that?" said Venn, strategically.

"Because," said she—stopping to put the little girl, who had managed to get herself upside down, right end up again—"because I do."

"You mustn't judge by folks in general," said Venn. "Still, I don't know much what feelings are nowadays. I have got so mixed up with business of one sort and t'other that my soft sentiments are gone off in vapor like. Yes, I am given up body and soul to the making of money. Money is all my dream."

"Oh, Diggory, how wicked!" said Thomasin, reproachfully, and looking at him in exact balance between taking his words seriously and judging them said to tease her.

"Yes, 'tis rather a rum course," said Venn, in the bland tone of one comfortably resigned to sins he could no longer overcome.

"You who used to be so nice!"

"Well, that's an argument I rather like, because what a man has once been he may be again." Thomasin blushed. "Except that it is rather harder now," Venn continued.

"Why?" she asked.

"Because you be richer than you were at that time."

"Oh no—not much. I have made it nearly all over to the baby, as it was my duty to do, except just enough to live on."

"I am rather glad of that," said Venn, softly, and regarding her from the corner of his eye, "for it makes it easier for us to be friendly."

Thomasin blushed again, and, when a few more words had been said of a not unpleasing kind, Venn mounted his horse and rode on.

This conversation had passed in a hollow of the heath near the old Roman road—a place much frequented by Thomasin. And it might have been observed that she did not in future walk that way less often from having met Venn there now. Whether or not Venn abstained from riding thither because he had met Thomasin in the same place might easily have been guessed from her proceedings about two months later in the same year.

CHAPTER III.

THE SERIOUS DISCOURSE OF CLYM WITH HIS COUSIN.

THROUGHOUT this period Yeobright had more or less pondered on his duty to his cousin Thomasin. He could not help feeling that it would be a pitiful waste of sweet material if the tender-natured thing should be doomed from this early stage of her life onward to dribble away her winsome qualities on lonely gorse and fern. But he felt this as an economist merely, and not as a lover. His passion for Eustacia had been a sort of conserve of his whole life, and he had nothing more of that supreme quality left to bestow. So far the obvious thing was not to entertain any idea of marriage with Thomasin, even to oblige her.

But this was not all. Years ago there had been in his mother's mind a great fancy about Thomasin and himself. It had not positively amounted to a desire, but it had always been a favorite dream. That they should be man and wife in good time, if the happiness of neither were endangered thereby, was the fancy in question. So that what course save one was there now left for any son who reverenced his mother's memory as Yeobright did? It is an unfortunate fact that any particular whim of parents which

might have been dispersed by half an hour's conversation during their lives, becomes sublimated by their deaths into a fiat the most absolute, with such results to conscientious children as those parents, had they lived, would have been the first to decry.

Had only Yeobright's own future been involved, he would have proposed to Thomasin with a ready heart. He had nothing to lose by carrying out a dead mother's hope. But he dreaded to contemplate Thomasin wedded to the mere corpse of a lover that he now felt himself to be. He had but three activities alive in him. One was his almost daily walk to the little grave-yard wherein his mother lay; another, his just as frequent visits by night to the more distant inclosure which numbered Eustacia among its dead; the third was self-preparation for a vocation which alone seemed likely to satisfy his cravings — that of an itinerant preacher of the eleventh commandment. It was difficult to believe that Thomasin would be cheered by a husband with such tendencies as these.

Yet he resolved to ask her, and let her decide for herself. It was even with a pleasant sense of doing his duty that he went down stairs to her one evening for this purpose, when the sun was sending up the valley the same long shadow of the house-top that he had seen lying there times out of number while his mother lived.

Thomasin was not in her room, and he found her in the front garden. "I have long been wanting, Thomasin," he began, "to say something about a matter that concerns both our futures."

"And you are going to say it now?" she remarked, quickly, coloring as she met his gaze. "Do stop a minute, Clym, and let me speak first, for, oddly enough, I have been wanting to say something to you."

"By all means say on, Tamsie."

"I suppose nobody can overhear us?" she went on, casting her eyes around and lowering her voice. "Well, first you will promise me this—that you won't be angry and call me any thing harsh if you disagree with what I propose?"

Yeobright promised, and she continued: "What I want is your advice, for you are my relation—I mean, a sort of guardian to me—aren't you, Clym?"

"Well, yes, I suppose I am—a sort of guardian. In fact, I am, of course," he said, altogether perplexed as to her drift.

"I am thinking of marrying," she then observed, blandly. "But I shall not marry unless you assure me that you approve of such a step. Why don't you speak?"

"I was taken rather by surprise. But, nevertheless, I am very glad to hear such news. I shall approve, of course, dear Tamsie. Who can it be? I am quite at a loss to guess. No, I am not—'tis the old doctor! —not that I mean to call him old, for he is not very old, after all. Ah—I noticed when he attended you last time!"

"No, no," she said, hastily. "'Tis Mr. Venn."

Clym's face suddenly became grave.

"There, now, you don't like him, and I wish I hadn't mentioned him," she exclaimed, almost petulantly. "And I shouldn't have done it, either, only he keeps on bothering me so till I don't know what to do!"

Clym looked out of the window. "I like Venn well enough," he answered at last. "He is a very honest and at the same time astute man. He is clever, too, as is proved by his having got you to favor him. But really, Thomasin, he is not quite—"

"Gentleman enough for me. That is just what I feel. I am sorry now that I asked you, and I won't think any more of him. At the same time, I must marry him if I marry any body, that I *will* say."

"I don't see that," said Clym, carefully concealing every clew to his own interrupted intention, which she plainly had not guessed. "You might marry a professional man, or somebody of that sort, by going into the town to live, and forming acquaintances there."

"I am not fit for town life—so very rural and silly as I always have been. Do not you yourself notice my countrified ways?"

"Well, when I came home from Paris I did, a little; but I don't now."

"That's because you have got countrified too. Oh, I couldn't live in a street for the world! Egdon is a ridiculous old place; but I have got used to it, and I couldn't be happy any where else at all."

"Neither could I," said Clym.

"Then how could you say that I should marry some town man? I am sure, say what you will, that I must marry Diggory if I marry at all. He has been kinder to me than any body else, and has helped me in many ways that I don't know of." Thomasin almost pouted now.

"Yes, he has," said Clym, in a neutral tone. "Well, I wish with all my heart that I could say, marry him. But I can not forget what my mother thought on that matter, and it goes rather against me not to respect her opinion. There is too much reason why we should do the little we can to respect it now."

"Very well, then," sighed Thomasin. "I will say no more."

"But you are not bound to obey my wishes. I merely say what I think."

"Oh no—I don't want to be rebellious in that way," she said, sadly. "I had no business to think of him—I ought to have thought of my family. What dreadfully bad impulses there are in me!" Her lips trembled, and she turned away to hide a tear.

Clym, though vexed at what seemed her

unaccountable taste, was in a measure relieved to find that at any rate the marriage question in relation to himself was shelved. Through several succeeding days he saw her at different times from the window of his room, moping disconsolately about the garden. He was half angry with her for choosing Venn; then he was grieved at having put himself in the way of Venn's happiness, who was, after all, as honest and persevering a young fellow as any on Egdon, since he had turned over a new leaf. In short, Clym did not know what to do.

When next they met she said, abruptly, "He is much more respectable now than he was then."

"Who?—oh yes, Diggory Venn."

"Aunt only objected because he was a reddleman."

"Well, Thomasin, perhaps I don't know all the particulars of my mother's wish. So you had better use your own discretion."

"You will always feel that I slighted your mother's memory."

"No, I will not. I shall think you are convinced that, had she seen Diggory in his present position, she would have considered him a fitting husband for you. Now that's my real feeling. Don't consult me any more, but do as you like, Thomasin. I shall be content."

It is to be presumed that Thomasin was convinced; for a few days after this, when Clym strayed into a part of the heath he had not lately visited, Humphrey, who was at work there, said to him, "I am glad to see that Mrs. Wildeve and Venn have made it up again, seemingly."

"Have they?" said Clym, abstractedly.

"Yes; and he do contrive to stumble upon her whenever she walks out on fine days with the chiel. But, Mr. Yeobright, I can't help feeling that your cousin ought to have married you. 'Tis a pity to make two chimley-corners where there need be only one. You could get her away from him now, 'tis my belief, if you were only to set about it."

"How can I have the conscience to marry, after having driven two women to their deaths? Don't think such a thing, Humphrey. After my experience I should consider it too much of a burlesque to go to church and take a wife. In the words of Job, 'I have made a covenant with mine eyes; why then should I think upon a maid?'"

"No, Mr. Clym; don't fancy that about driving two women to their deaths. You shouldn't say it."

"Well, we'll leave that out," said Yeobright. "But anyhow the times have set a mark upon me which wouldn't look well in a love-making scene. I have two ideas in my head, and no others. I am going to keep a night school; and I am going to turn preacher. What have you got to say to that, Humphrey?"

"I'll come and hear ye with all my heart."

"Thanks. 'Tis all I wish."

As Clym descended into the valley, Thomasin came down by the other path, and met him at the gate. "What do you think I have to tell you, Clym?" she said, looking archly over her shoulder at him.

"I can guess," he replied.

She scrutinized his face. "Yes, you guess right. It is going to be, after all. He thinks I may as well make up my mind, and I have got to think so too. It is to be on the twenty-fifth of next month, if you don't object."

"Do what you think right, dear. I am only too glad that you see your way clear to happiness again. My sex owes you every amends for the treatment you received in days gone by."

CHAPTER IV.

HUMAN CHEERFULNESS AGAIN ASSERTS ITSELF AT BLOOMS END, AND CLYM FINDS HIS VOCATION.

ANY body who had passed through Blooms End about eleven o'clock on the morning fixed for the wedding would have found that, while Yeobright's house was comparatively quiet, sounds denoting great activity came from the dwelling of his nearest neighbor, Timothy Fairway. It was chiefly a noise of feet, briskly crunching hither and thither over the sanded floor within. One man only was visible outside, and he seemed to be later at an appointment than he had intended to be, for he hastened up to the door, lifted the latch, and walked in without ceremony.

The scene within was not quite the customary one. Standing about the room was the little knot of men who formed the chief part of the Egdon coterie, there being present Fairway himself, Grandfer Cantle, Humphrey, Christian, and Sam the turf-cutter. It was a warm day, and the men were, as a matter of course, in their shirt sleeves, except Christian, who had always a nervous fear of parting with a scrap of his clothing when in any body's house but his own. Across the stout oak table in the middle of the room was thrown a mass of striped linen, which Grandfer Cantle held down on one side and Humphrey on the other, while Fairway rubbed its surface with a yellow lump, his face being damp and creased with the effort of the labor.

"Waxing a bed-tick, souls?" said the newcomer.

"Yes, Sam," said Grandfer Cantle, as a man too busy to waste words. "Shall I stretch this corner a shade tighter, Timothy?"

Fairway replied, and the waxing went on with unabated vigor. "'Tis going to be a good bed, by the look o't," continued Sam, after an interval of silence. "Who may it be for?"

"'Tis a present for the new-folks that's going to set up housekeeping," said Christian, who stood helpless and overcome by the majesty of the proceedings.

"Ah, to be sure; and a valuable one, 'a b'lieve."

"Beds be dear to fokes that don't keep geese, bain't they, Mister Fairway?" said Christian, as to an omniscient being.

"Yes," said Fairway, standing up, giving his forehead a thorough mopping, and handing the bees-wax to Humphrey, who succeeded at the rubbing forthwith. "Not that this couple be in want of one, but 'twas well to show 'em a bit of friendliness at this great racketing vagary of their lives. I set up both my own daughters in one when they were married, and there have been feathers enough for another in the house the last twelve months. Now then, neighbors, I think we have laid on enough wax. Grandfer Cantle, you turn the tick the right way outward, and then I'll begin to shake in the feathers."

When the bed was in proper trim, Fairway and Christian brought forward vast paper bags, stuffed to the full, but light as balloons, and began to turn the contents of each into the receptacle just prepared. As bag after bag was emptied, airy tufts of down and feathers floated about the room in increasing quantity, till, through a mishap of Christian's, who shook the contents of one bag outside the tick, the atmosphere of the room became dense with gigantic flakes, which descended upon the workers like a windless snow-storm.

"I never see such a clumsy chap as you, Christian," said Grandfer Cantle, severely. "You might have been the son of a man that's never been outside Blooms End in his life for all the wit you have. Really all the soldiering and smartness in the world in the father seems to count for nothing in forming the nater of the son. As far as that chiel Christian is concerned, I might as well have staid at home and seed nothing, like all the rest of ye here. Though, as far as myself is concerned, a dashing spirit has counted for sommat, to be sure."

"Don't ye let me down so, father; I feel no bigger than a nine-pin after it! I've made but a bruckle hit, I'm afeard."

"Come, come. Never pitch yerself in such a low key as that, Christian; you should try more," said Fairway.

"Yes, you should try more," echoed the Grandfer, with insistence, as if he had been the first to make the suggestion. "In common conscience every man ought either to marry or go a soldier. 'Tis a scandal to the nation to do neither one nor t'other. I did both, thank God. Neither to raise men nor to lay 'em low—that shows a poor, do-nothing spirit indeed."

"I never had the nerve to stand fire," faltered Christian. "But as to marrying, I own I've asked here and there, though 'ithout much fruit from it. Yes, there's some house or other that might have had a man for a master—such as he is—that's now ruled by a woman alone. Still, it might have been awkward if I had found her out; for, d'ye see, neighbors, there'd have been nobody left at home to keep down father's spirits to the decent pitch that becomes a old man."

"And you've your work cut out to do that, my son," said Grandfer Cantle, smartly. "I wish that the dread of infirmities was not so strong in me!—I'd start the very first thing to-morrow to see the world over again. But seventy-one, though nothing at home, is a high figure for a rover. . . . Ay, seventy-one last Candlemas-day. Gad, I'd sooner have it in guineas than in years!" And the old man sighed.

"Don't ye be mournful, Grandfer," said Fairway. "Empt some more feathers into the bed-tick, and keep up yer heart. Though rather lean in the stalks, you be a green-leaved old man still. There's time enough left to ye yet to fill whole chronicles."

"Begad, I'll go to 'em, Timothy—to the married pair!" said Grandfer Cantle, in an encouraged voice, and starting round briskly. "I'll go to 'em to-night, and sing a wedding song—hey? 'Tis like me to do so, you know; and they'd see it as such. My 'Down in Cupid's Gardens' was well liked in four; still, I've got others as good, and even better. What do ye say to my

> 'She call'-ed to' her love'
> From the lat'-tice a-bove',
> "Oh, come in' from the fog'-gy fog'-gy dew'."'

'Twould please 'em well at such a time. Really, now I come to think of it, I haven't turned my tongue in my head to the shape of a real good song since Old Midsummer night, when we had the 'Barley Mow' at the Woman; and 'tis a pity to neglect your strong point where there's few that have the compass for such things!"

"So 'tis, so 'tis," said Fairway. "Now gie the bed a shake down. We've put in seventy pound of best feathers, and I think that's as many as the tick will fairly hold. A bit and a drap wouldn't be amiss now, I reckon. Christian, maul down the victuals from corner cupboard if canst reach, man, and I'll draw a drap o' sommat to wet it with."

They sat down to a lunch in the midst of their work, feathers around, above, and below them; the original owners of which occasionally looked in at the open door and cackled begrudgingly at sight of such a quantity of their old clothes.

"Upon my soul I shall be chokt," said Fairway, when, having extracted a feather from his mouth, he found several others floating on the mug as it was handed round.

"I've swallered several; and one had a

tolerable quill," said Sam, placidly, from the corner.

"Hullo! what's that?—wheels I hear coming?" Grandfer Cantle exclaimed, jumping up and hastening to the door. "Why, 'tis they back again: I didn't expect 'em yet this half hour. To be sure, how quick marrying can be done when you are in the mind for't!"

"Oh yes, it can soon be *done*," said Fairway, as if something should be added to make the statement complete.

He arose and followed the Grandfer, and the rest also went to the door. In a moment an open fly was driven past, in which sat Venn and Mrs. Venn, Yeobright, and a grand relative of Venn's who had come from Budmouth for the occasion. The fly had been hired at the nearest town, regardless of distance or cost, there being nothing on Egdon Heath, in Venn's opinion, dignified enough for such an event when such a woman as Thomasin was the bride; and the church was too remote for a walking bridal party.

As the fly passed, the group which had run out from the homestead shouted "Hurrah!" and waved their hands, feathers and down floating from their hair, their sleeves, and the folds of their garments at every motion, and Grandfer Cantle's seals dancing merrily in the sunlight as he twirled himself about. The driver of the fly turned a supercilious gaze upon them; he even treated the wedded pair themselves with something of condescension; for in what other state than heathen could people, rich or poor, exist who were doomed to abide in such a world's end as Egdon? Thomasin showed no such superiority to the group at the door, fluttering her hand as quickly as a bird's wing toward them, and asking Diggory, with tears in her eyes, if they ought not to alight and speak to these kind neighbors. Venn, however, suggested that, as they were all coming to the house in the evening, this was hardly necessary.

After this excitement the saluting party returned to their occupation, and the stuffing and sewing were soon afterward finished, when Fairway harnessed a horse, wrapped up the cumbrous present, and drove off with it in the cart to Venn's house at North Shadwater.

Yeobright, having filled the office at the wedding service which naturally fell to his hands, and afterward returned to the house with the husband and wife, was indisposed to take part in the feasting and dancing which wound up the evening. Thomasin was disappointed.

"I wish I could be there without dashing your spirits," he said. "But I might be too much like the skull at the banquet."

"No, no."

"Well, dear, apart from that, if you would excuse me, I should be glad. I know it seems unkind; but, dear Thomasin, I fear I should not be happy in the company—there, that's the truth of it. I shall always be coming to see you at your new home, you know, so that my absence now will not much matter."

"Then I give in. Do whatever will be most comfortable to yourself."

Clym retired to his lodging at the housetop, much relieved, and occupied himself during the afternoon in noting down the heads of a sermon, with which he intended to initiate all that really seemed practicable of the scheme that had originally brought him hither, and that he had so long kept in view, under various modifications, through evil and good report. He had tested and weighed his convictions again and again, and saw no reason to alter them, though he had considerably lessened his plan. His eyesight, by long humoring in his native air, had grown stronger, but not sufficiently strong to warrant his attempting his extensive educational project. Yet he did not repine: there was still more than enough of an unambitious sort to tax all his energies and occupy all his hours.

Evening drew on, and sounds of life and movement in the lower part of the domicile became more pronounced, the gate in the palings clicking incessantly. The party was to be an early one, and all the guests were assembled long before it was dark. Yeobright went down the back staircase and into the heath by another path than that in front, intending to walk in the open air till the party was over, when he would return to wish Thomasin and her husband good-by as they departed. His steps were insensibly bent toward Mistover, by the path that he had followed on that terrible morning when he learned the strange news from Susan's boy.

He did not turn aside to the cottage, but pushed on to an eminence whence he could see over the whole quarter that had once been Eustacia's home. While he stood observing the darkening scene, somebody came up. Clym, seeing him but dimly, would have let him pass by silently, had not the pedestrian, who was Charley, recognized the young man and spoken to him.

"Charley, I have not seen you for a length of time," said Yeobright. "Do you often walk this way?"

"No," the lad replied. "I don't often come outside the bank."

"You were not at the May-pole?"

"No," said Charley, in the same listless tone. "I don't care for that sort of thing now."

"You rather liked Miss Eustacia, didn't you?" Yeobright gently asked. Eustacia had frequently told him of Charley's romantic attachment.

"Yes, very much. Ah, I wish—"

"Yes?"

"I wish, Mr. Yeobright, you could give me something to keep that once belonged to her—if you don't mind."

"I shall be very happy to. It will give me very great pleasure, Charley. Let me think what I have of hers that you would like. But come with me to the house, and I'll see."

They walked toward Blooms End together. When they reached the front it was dark, and the shutters were closed, so that nothing of the interior could be seen.

"Come round this way," said Clym. "My entrance is at the back for the present."

The two went round and ascended the crooked stair in darkness, till Clym's sitting-room on the upper floor was reached, where he lit a candle, Charley entering gently behind. Yeobright searched his desk, and, taking out a sheet of tissue-paper, unfolded from it two or three undulating locks of raven hair, which fell over the paper like black streams. From these he selected one, wrapped it up, and gave it to the lad, whose eyes had filled with tears. He kissed the packet, put it in his pocket, and said, in a voice of emotion, "Oh, Mr. Clym, how good you are to me!"

"I will go a little way with you," said Clym. And amid the noise of merriment from below they descended. Their path to the front led them close to a little side window, whence the rays of candles streamed across the shrubs. The window, being screened from general observation by the bushes, had been left unblinded, so that a person in this private nook could see all that was going on within the room which contained the wedding guests, except in so far as vision was hindered by the green antiquity of the panes.

"Charley, what are they doing?" said Clym. "My sight is weaker again to-night, and the glass of this window is not good."

Charley wiped his own eyes, which were rather blurred with moisture, and stepped closer to the casement. "Mr. Venn is asking Christian Cantle to sing," he replied; "and Christian is moving about in his chair as if he were much frightened at the question, and his father has struck up a stave instead of him."

"Yes, I can hear the old man's voice," said Clym. "So there's to be no dancing, I suppose. And is Thomasin in the room? I see something moving in front of the candles that resembles her shape, I think."

"Yes. She do seem happy. She is red in the face, and laughing at something Fairway has said to her. Oh, my!"

"What noise was that?" said Clym.

"Mr. Venn is so tall that he has knocked his head against the beam in gieing a skip as he passed under. Mrs. Venn hev run up quite frightened, and now she's put her hand to his head to feel if there's a lump. And now they be all laughing again as if nothing had happened."

"Do any of them seem to care about my not being there?" Clym asked.

"No—not a bit in the world. Now they are all holding up their glasses and drinking somebody's health."

"I wonder if it is mine?"

"No, 'tis Mr. and Mrs. Venn's, because he is making a hearty sort of speech. There—now Mrs. Venn has got up, and is going away to put on her things, I think."

"Well, they haven't concerned themselves about me, and it is quite right they should not. It is all as it should be, and Thomasin at least is happy. We will not stay any longer now, as they will soon be coming out to go home."

He accompanied the lad into the heath on his way home, and returning alone to the house a quarter of an hour later, found Venn and Thomasin ready to start, all the guests having departed in his absence. The wedded pair took their seats in the four-wheeled dog-cart which Venn's head milker and handy man had driven from Shadwater to fetch them in; little Eustacia and the nurse were packed securely upon the opened flap behind, and the milker, on an ancient overstepping pony whose shoes clashed like cymbals at every tread, rode in the rear, in the manner of a body-servant of the last century.

"Now we leave you in absolute possession of your own house again," said Thomasin, as she bent down to wish her cousin good-night. "It will be rather lonely for you, Clym, after the hubbub we have been making."

"Oh, that's no inconvenience," said Clym, smiling rather sadly. And then the party drove off, and vanished in the night shades, and Yeobright entered the house. The ticking of the clock was the only sound that greeted him, for not a soul remained—Christian, who acted as cook, valet, and gardener to Clym, sleeping at his father's house. Yeobright sat down in one of the vacant chairs, and remained in thought a long time. His mother's old chair was opposite; it had been sat in that evening by those who had scarcely remembered that it ever was hers. But to Clym she was almost a presence there, now as always. Whatever she was in other people's memories, in his she was the sublime saint whose radiance even his tenderness for Eustacia could not obscure. But his heart was heavy; that mother had *not* crowned him in the day of his espousals, and in the day of the gladness of his heart. And events had borne out the accuracy of her judgment, and proved the devotedness of her care. He should have heeded her for Eustacia's sake even more than for his own. "It was all

my fault," he whispered. "Oh, my mother! my mother! would to God that I could live my life again, and endure for you what you endured for me!"

On the Sunday after this wedding an unusual sight was to be seen on Blackbarrow. From a distance there simply appeared to be a motionless figure standing on the top of the tumulus, just as Eustacia had stood on that lonely summit some two years and a half before. But now it was fine warm weather, with only a summer breeze blowing, and early afternoon instead of dull twilight. Those who ascended to the immediate neighborhood of the barrow perceived that the erect form in the centre, piercing the sky, was not really alone. Round him upon the slopes of the barrow a number of heath-men and women were reclining or sitting at their ease. They listened to the words of the man in their midst, who was preaching, while they abstractedly pulled heather, stripped ferns, or tossed pebbles down the slope. This was the first of a series of moral lectures or sermons on the mount, which were to be delivered from the same place every Sunday afternoon as long as the fine weather lasted.

The commanding elevation of Blackbarrow had been chosen for two reasons: first, that it occupied a central position among the remote cottages around, secondly, that the preacher thereon could be seen from all adjacent points as soon as he arrived at his post, the view of him being thus a convenient signal to those stragglers who wished to draw near. The speaker was bare-headed, and the breeze at each waft gently lifted and lowered his hair, somewhat too thin for a man of his years, these still numbering less than thirty. He wore a shade over his eyes, and his face was pensive and worn; but though these bodily features were marked with decay, there was no defect in the tones of his voice, which were rich, musical, and stirring. He stated that his discourses to people were to be sometimes secular and sometimes religious, but never dogmatic; and that his texts would be taken from all kinds of books. This afternoon the words were as follows:

"And the king rose up to meet her, and bowed himself unto her, and sat down on his throne, and caused a seat to be set for the king's mother; and she sat on his right hand. Then she said, I desire one small petition of thee: I pray thee say me not nay. And the king said unto her, Ask on, my mother: for I will not say thee nay."

Yeobright had in fact found his vocation in the career of an itinerant open-air preacher and lecturer on morally unimpeachable subjects; and from this day he labored incessantly in that office, speaking not only in simple language on Blackbarrow and in the upland hamlets round, but in a more cultivated strain elsewhere—from the steps and porticoes of town-halls, from market crosses, from conduits, on esplanades and on wharves, from the parapets of bridges, in barns and out-houses, and all other such places in the neighboring Wessex towns and villages. He left alone set creeds and systems of philosophy, finding enough and more than enough to occupy his tongue in the opinions and actions common to all good men. Some believed him, and some believed not; some said that his words were commonplace, others complained of his want of spiritual doctrine, while others again remarked that it was well enough for a man to take to preaching who could not see to do any thing else. But every where he was kindly received, for the history of his life had become generally known.

THE END.

THE GREAT HARVEST YEAR.

[The harvest of the year 1878 is the largest harvest which ever ripened in America. The exports of food are much greater than ever before.]

THE night the century ebbed out, all worn with work and sin,
The night a twentieth century, all fresh with hope, came in,
The children watched, the evening long, the midnight clock to see,
And to wish to one another "A Happy Century!"
They climbed upon my knee, and they tumbled on the floor,
And Bob and Nell came begging me for stories of the War.

But I told Nell that I could tell no tales but tales of peace—
God grant that for a hundred years the tales of War might cease!
I told them I would tell them of the blessed Harvest Store,
Of the Year in which God fed men as they ne'er were fed before;
For, till that year of matchless cheer, since suns or worlds were made,
Never sent land to other lands such gift of Daily Bread!

The War was done, and men began to live in peaceful ways,
For thirteen years of hopes and fears, dark nights and joyful days.
If wealth would slip, if wit would trip, and neither would avail,
"Lo! the seed-time and the harvest," saith the Lord, "shall never fail."

And to all change of ups and downs, to every hope and fear,
To men's amaze came round the days of the Great Harvest Year,
When God's command bade all the land join heart and soul and mind,
And health and wealth, and hand and land, for feeding half mankind.

So hot the noons of ripe July, that men took day for sleep,
And when the night shone clear and bright, they took their time to reap;
Nor can the men cut all the grain when hungry worlds are fed,
So the ready Ruths and Orpahs are gleaning in their stead.
All through the heated summer day the Kansas maidens slept,
All through the night, with laughter light, their moonlight vigil kept;
From set of sun the kindly moon until the break of day
Watched o'er their lightsome harvest-work, and cheered them on their way.
They drove their handsome horses down, they drove them up again,
While "click, click, click," the rattling knives cut off the heavy grain;
Before it falls, around the straw the waiting wires wind,
And the well-ordered sheaves are left in still array behind.
So laughing girls the harvest reap, all chattering the while,
While "click, click, click," the shears keep their chorus, mile by mile;
And lazy Morning blushes when she sees the harvest stands
In ordered files, those miles on miles, to feed the hungry lands.

Far in the South from day to day a living tide swept forth,
As, wave on wave, the herds of kine flowed slowly to the North.
Great broad-horned oxen, tender-eyed, and such as Juno loved,
In troops no man could number, across the prairie moved;
Behind, along their wavy line, the brown rancheros rode,
From east to west, from west to east, as North the column flowed,
To keep the host compact and close from morn to setting sun,
Nor on the way leave one estray, as the great tide poured on.
A fair-haired Saxon boy beside commanded the array,
And as it flowed along the road, I heard the stripling say,
"'Tis God's command these beeves shall stand upon the Cheviot Hills,
The land to feed where rippling Tweed the lowland dews distills,"
So the great herd flows Northward, as the All-Father wills.

Far in the North the winter's gales blew sharply from northwest,
And locked the lakes and rivers hard in their icy rest.
I saw men scrape the crystal lakes to clear them from the snow,
I saw them drive in long straight lines the ice-ploughs to and fro;
The blocks of amethyst they slid up to the sheltering shed
By the long lines of ready rail, and as they worked they said,
"Drive close the blocks, nor leave a chink between for breath of air,
Not winter's wind nor summer's sun may ever enter there,
But square and dry and hard and smooth the ice must ready be,
When summer suns are blazing, for its journey to the sea,
To pack the meat and keep it sweet, as the good God commands,
To feed His hungry children in so many waiting lands."

And far away from Northern ice and drifts of crystal snows,
On the rich coast where deep and red the Mississippi flows,
When the thick sugar-canes were ripe beneath the autumn sun,
We listened for the earliest cock to tell of day begun.
In the cool sugar-house I slept upon my pallet bed,
Where Pierre Milhet, my princely host, had called his men, and said,
"At morning's call be ready all to meet here at the mill,
That not one drop may lazy stop before the vats we fill.
What man will be the first at dawn from lazy sleep to rise,
When the first gray of daybreak pales in the eastern skies,
What man will first his load of cane fling down before the door,
For that man's wife I give as prize this old-time louis d'or."
And all day long the hard-pressed mules the heaps of ripened cane
Brought swiftly to the mill, and then rushed back to bring again,
That all day long the rollers the fresh supply might grind,
Nor should one stalk be left not gleaned on the intervale behind.
So black and white, with main and might, are all united here,
Lest the harvest lack its sweets in God's Great Harvest Year.

The boys and girls the orchards thronged in those October days
Where the golden sun shone hotly down athwart the purple haze.
It warmed the piles of ruddy fruit which lay beneath the trees,
From which the apples, red and gold, fell down with every breeze.
The smallest boy would creep along to clasp the farthest bough,
And throw the highest pippin to some favored girl below.

The sound hard fruit with care we chose, we wiped them clean and dry,
While in the refuse heaps, unused, we let the others lie.
For pigs and cows and oxen those, for other lands were these,
And only what was hard and sound should sail across the seas.
Then, as the sun went down too soon, we piled the open crates,
And dragged them full where cellar cool threw wide its waiting gates,
So that the air which circled there was cold, but not too cold,
To keep for Eastern rivalry our Western fruit of gold.
And as old Evans thoughtful stood, and watched the boys that day,
I stood so near that I could hear the grim old Shaker say,
"Shame on our Yankee orchards, if the fruit should not be good
The year the land at God's command sends half the world its food!"

I saw what wealth untold of corn our gracious God bestowed
As for one autumn day I sped down the Rock River Road.
All night we slept, but still we kept our tireless way till morn,
And, with the light, on left and right still stretched those shocks of corn.
A hundred thousand girls that year wore their engagement ring,
And a hundred thousand others before another spring;
But when the husking parties came, with all their frolic play,
The "corn-fed maidens" might have kissed and kissed and kissed all day,
And although they kissed the boys but once for every thousandth ear,
They would not kiss for half the corn that blessed harvest year.
Yet buxom girls and hearty boys were ready, as they could,
To send love's blessing with the trains that took the world its food.
For since God smiled upon His child, in comfort or in care,
Was never yet such answer made to all His children's prayer.

A northeast gale, with snow and hail, bore down upon the sea;
With heavy rolls, beneath bare poles, we drifted to the lee.
When morning broke, the skipper spoke, and never sailor shirked,
But with a will, though cold and chill, from morn to night we worked.
Off in the spray the livelong day our spinning lines we threw,
And on each hook a struggling fish back to the deck we drew.
I know I looked to windward once, but the old man scowled, and said,
"Let no man flinch, nor give an inch, before his stent is made.
We've nothing for it, shipmates, but to heave the lines and pull,
Till each man's share has made the fare, and every cask is full.
This is no year for half a fare, for God this year decreed
That the forty States their hungry mates in all the lands shall feed."

No interval nor hind'rance the long procession break
Of the Legion which the swine-herds drive by the City of the Lake.
Up death's long way it moves all day, unconscious of its fate,
As swine with boars contend to hurry forward to the gate.
Thousands behind unwary crowd upon their leaders' tracks,
Nor hesitate nor falter as they near the headsman's axe.
For me, I stood away from blood and the silent stroke of death,
Where they packed the meat for the world to eat, in the basement crypt beneath.
I watched the task, as cask by cask was rolled by stalwart men,
And car on car to travel far was added to the train;
Nor ceased it then, but train on train pushed forth upon the rail,
Lest in some land the day's demand for daily food should fail.
For there shall not be a ship on the sea to sail, or far or near,
But the shipmates shall bless the plenteousness of the Great Harvest Year.

From last year's rice the black men the heaviest clusters choose,
And cull and thresh from every head the finest seed for use.
They beat it clean, they clayed it well, and when the field was sowed,
Up slid the sluice, and o'er the lands rushed in the waiting flood,
And then, without a ripple, above the trenches stood.
Soon through the glassy waters shot up the needles green,
With not a tare, nor "volunteer," nor choking weed between.
Then, month by month, the joints grew up, so long and strong and high
That the tall men who hoed them last were hidden from the sky.
But, all the same, when harvest came, their sickles cut them low,
And they left the heads to ripen on the stubble patch below.
From field to flats, in flats to barns, they bear the rice, until
To thresh and beat, and clean and clear, they leave it at the mill.
The yellow husk is torn away, and the waiting casks receive
The stream of ice-white jewels from the great iron sieve.
So the black man's care sends out his share, for he knows that God has said
That His people here in His Harvest Year shall send His world its bread.

While fields were bright with summer light, and heaven was all ablaze,
O'er the broad Mohawk pastures I saw the cattle graze.
At early day they take their way, when cheerful morning warns,
And slowly leave the shelter of the hospitable barns.
The widow's son drew all the milk which the crowded bag would yield,
And sent his pretty Durham to her breakfast in the field.
One portion then for the children's bowls the urchin set away,
One part he set for cream for the next churning-day;
But there was left enough for one little can beside,
And with this the thrifty shaver to the great cheese factory hied.
His milk was measured with the rest, and poured into the stream,
And as he turned away he met Van Antwerp's stately team,
Which bore a hundred gallons from the milking of that day,
And this was poured to swell the hoard fed by that milky way.
The snowy curd is fitly stirred, the cruel presses squeeze
Until the last weak drop has passed, and lo! the solid cheese.
In Yorkshire mill, on Snowdon's hill, men eat it with their bread,
Nor think nor ask of the distant task of the boy by whom they're fed.
But when autumn's done the widow's son stands at Van Antwerp's side,
And takes in his hand his dividend paid for the milky tide.

So South and North the food send forth to meet the nation's need,
So black and white, with main and might, the hungry peoples feed;
Since God bade man subdue the earth, and harvest-time began,
Never in any land has earth been so subdued by man.

Praise God for wheat, so white and sweet, of which to make our bread!
Praise God for yellow corn, with which His waiting world is fed!
Praise God for fish and flesh and fowl, He gave to man for food!
Praise God for every creature which He made, and called it good!
Praise God for winter's store of ice! Praise God for summer's heat!
Praise God for fruit tree bearing seed—"to you it is for meat!"
Praise God for all the bounty by which the world is fed!
Praise God His children all to whom He gives their daily bread!

Editor's Easy Chair.

MR. WHIPPLE'S paper on Rufus Choate in the November number of this Magazine was a delightful sketch of a delightful man. It appeared simultaneously with a new issue of Professor Brown's biography, and with the publication of a volume of Mr. Choate's speeches and orations, and naturally renews, in a time of less heat than that in which he lived, reflection upon the character and career of one of the most striking American figures of the last generation. Mr. Whipple's article upon Choate, like Mr. Lodge's upon Timothy Pickering, shows how vivid and complete a personal sketch may be made. It is, indeed, the proof that the author of such a sketch is justified in undertaking it, that the excellence of his work spares the reader the necessity of going over his material. The trouble with many biographies, as we said last month, is that they are merely accumulations of material for biography. A biographer is an artist who paints a picture, not a tyro who sets a palette.

The impression that Mr. Choate leaves upon the younger men of his generation, and who knew something of his kindly nature, his generous heart, is that of a man born out of time, as his contemporary Mr. Sumner was especially born at the very moment to secure his good fame. It is easy to see in the two interesting volumes of Mr. Pierce which tell the story of Sumner's youth that at an earlier or later epoch he might have taken a less prominent part in the action of his time and country. Mr. Sumner came forward into public life as the successor of Mr. Webster, and with character, convictions, and gifts which especially and amply fitted him for the great controversy in which he, and not Mr. Webster, really represented his State and New England and the inevitable course of events. The Whig sentiment at that time dominant in Massachusetts was confounded by such a successor to the "godlike" Webster. "The people of Massachusetts," said its chief organ, "did not wish his election." But could that people have foreseen the immediate future, and could they have read at once and truly the character of the "theorist" and "scholar" and "closet" statesman at whom the organ sneered, they would have seen the one man in their State expressly fitted for his place, the Samson whose flowing locks of strength no Delilah could shear.

Of the Whig sentiment, however, which would not yield, which defied the rising tide of conscience, and doggedly appealed to those who were staking all upon a principle to conquer their prejudices—of that day when it seemed that Hutchinson was once more contesting with Sam Adams the control of Massachusetts—Mr. Webster was the great representative, and Mr. Choate was his lieutenant. Not all his charm, not the wealth of his learning, nor the sparkle of his wit, nor the fire and grace of his oratory, nor his sweet and gracious nature, could atone for what seemed Choate's recreancy to the high and characteristic conviction

of New England. On the very Fourth of July itself he marshalled the splendors of his rhetoric to strike the public conscience blind to slavery, and while Kansas lay bleeding he went over openly into the camp of the foe. These were acts that could not be condoned by the conscience of Massachusetts. They have never been forgiven, and they affected the judgment of his contemporaries so that Mr. Choate has not had the just renown of his remarkable gifts and graces.

It is, of course, true of Choate, as of Webster, that he was not all insensible to the spirit of his time and of the community in which he lived. In his speeches on Plymouth Rock and at Niblo's Garden, Webster spoke in full sympathy with American ideas; and in his speech in 1844 before the Young Men's Whig Club of Boston, upon the annexation of Texas, Choate, begging the annexationists to pause, reminded them that "a public opinion has been generated, has been organized, wholly new, aggressive, intolerant of the sight, intolerant of the cry, of man in chains." But in the same address he appealed to the love of that Union which "neither the small gasconades of nullifiers nor the gloomy ravings of fanatics have chilled;" and that was the shibboleth which showed that he did not comprehend the "irrepressible conflict between opposing and enduring forces." As the lines were drawn—the deep, wide, significant lines—they separated Webster and his most captivating and powerful ally from the conscience of their State and the movement of their country.

As a lawyer, Mr. Choate will live in the books and the admiring and fascinated traditions of the profession; as a statesman he left no sign; and it is as an orator that he must be known by the great general public. He was one of four great orators, only one of whom survives, who were of the same city and for many years contemporaries —orators who are among the most renowned in our history, and undoubtedly the peers of any who have lived in their time. Four more different orators, however, could hardly be named than Webster, Everett, Choate, and Phillips. The first three were in full political sympathy; the last was the voice of what seemed to them the very genius of fanaticism and disorder. All were alike in a certain scholarly spirit and familiarity with the great masters and traditions of oratory, and Choate and Phillips in a certain gayety of humor. They were all evidently children of the oldest community in the country. There was nothing of the frontier, none of the extravagance of half-learning and a provincial training, in their discourse. But besides these they had little in common. The majestic and solid simplicity of Webster differs as much from the elaborate fluency of Everett as the fervid and copious climaxes of Choate from the crisp and brilliant directness of Phillips. The last was an iconoclast; the others sought to repair the shattered images of Pan.

It is the fate of orators that their contemporary fame can not be always justified to posterity, because so much of eloquence lies in the tone, the glance, the action, the circumstance, the audience, the timeliness of the speaker, and the hearer's interest. Jefferson, when he heard Patrick Henry, said that he could not remember a word that the orator said, but that in hearing he was flushed and heated as if by fire. Yet we can read any word of Patrick Henry's, even in the famous scene in the House of Delegates—"and George the Third"—and wonder at our calmness as we read. For the words of the oration are but a part of it. They are seemly and formed, but they are dry bones and dead. It is only the breath of the living prophet that can make them live. At that breath the form of a man springs vast and boundless into a god, and the words that are printed upon the impressive page burn and blaze with celestial splendor. The fame of Choate must be, therefore, always half fabulous and strange; and yet no one who is sensitive to oratory can read his discourses without thrills of feeling and a glow of pleasure which will suggest the marvellous immediate impression of their delivery.

His rhetoric is criticised as turgid and extravagant, but, at least, its wonderful felicity saves it from becoming turgid. Choate's felicity of phrase is inimitable, because it is the touch of a truly poetic imagination. He had the instinct of an artist. The value of rich and melodious words, when fitly descriptive, was as intuitive to him as the richness of color to Georgione; and many of these pages are as fascinating from the long rolling and cumulative cadence as Turner's water-colors from the fruit-like bloom of tinting. The music, the association, the fitness of the word, suggested to his kindled and kindling imagination other images and other thoughts, and the masterful essay to grasp and hold them all produced those extraordinary, prolonged, and composite but not obscure sentences which are found in his discourses. Such sentences are not mere masses and groups of words, they are pictures in perspective, each part in place, and the total impression harmonious and beautiful. Coming to the page of Choate from the restrained and severe and simple word of Webster, clearly defining the thought as the line of the marble temple defines the structure against the sky, the impassioned flow and rush, the picturesque and graphic detail, the swing and resonance of the style, are bewildering. "It is *too* fluent, *too* melodious, *too* facile. It is not sincere. This is a rhetorician; it is not an earnest man with something to say." This is doubtless the first impression upon many minds. But it is mistaken. The orator may be wrong, but he is sincere. His conception of the Union and his devotion to it are as honest as Webster's, however different the expression. Philip Sidney in his gay velvet doublet was as hearty a Protestant as William of Orange in his sombre serge coat.

Choate could not be proposed as a model to young orators, for many reasons, but for this, among others, that the temperament and the imagination from which his oratorical style arises can not be supplied. But certainly no one would suggest that his orations would be improved by recasting them in sentences of two lines composed of words of one syllable. The penetrating sadness of his speech is not external, it is not more or less fault of style: it is the consciousness in the hearer of the blindness of the eyes above the lyrical lips; it is the want of that insight which comes from strict confidence in moral principle in the conduct of the commonwealth as in that of individual life. In 1856 he stood in Lowell and said, in glowing and touching and resplendent phrase, that the election of Mr. Buchanan would be "a victory of peace."—They are all gone, those

days and those men. But as we follow the fascinating figure that Mr. Whipple portrays, we think of Falkland astray in the troops of the king.

Modern criticism has destroyed the authenticity of many romantic traditions, which, however, will probably still survive. The very argument which wounds them renews their life. A "myth" which constantly re-appears in different countries and under different circumstances has its roots in human nature. The story, whether specifically true or untrue, typifies a heroism, a devotion, a virtue, which the common heart accepts as true, and it gratefully repeats the tale from age to age, to stimulate a kindred spirit and to inspire great actions. Niebuhr disposed of the legendary tales of Rome, and drove out of history the kindly wolf-mother of Romulus and Remus, and one by one the quaint old stories have vanished into wind myths and sun myths. The Colossus no longer bestrides the gate of the harbor of Rhodes. Belisarius, blind and penniless, begs no more. There was no Pope Joan, and Joan of Arc was not burned, but married and lived happily ever after. The loves of Abelard and Héloïse are a historical error, and Petrarch's Laura is as unreal as Poe's Leonore. Saddest of all, William Tell shot no apple from his son's head, but is a worthy Swiss peasant inextricably entangled in a Scandinavian legend.

A year or two ago we called attention to the ravages of this critical spirit among our own traditions, and especially to the mortal blow that had been dealt at the famous tale of the sudden appearance of the regicide with white locks and venerable mien to lead the repulse of the Indian attack upon Hadley, in the ox-bow of the Connecticut, during King Philip's war. It was a very neat and conclusive blow; nor has any attempt, to our knowledge, ever been made to break its force. The story was hunted down into an unimportant foot-note in Hutchinson's *History*, where it rested solely upon a tradition in the Leverett family, and in the light of settled historic dates and facts the beautiful tradition disappears like a cloud in the sunrise. It was to be expected that the same spirit might attack our romantic Revolutionary traditions, the first and one of the most delightful of which is the midnight ride of Paul Revere. In fact, that old story as commonly told has now been touched, not in its essence, but in one of its romantic incidents, which has been sung in Longfellow's delightful ballad.

Fortunately the Revolution is not so far behind us that immediate descendants of its heroes may not still be found who cherish the traditions of their families, and who have an unappeasable interest to find and to tell the truth that sheds lustre upon an ancestor. Such a descendant is Mr. Henry W. Holland, of Boston, who has just privately published a handsome monograph of *William Dawes and his Ride with Paul Revere.* Mr. Holland is a descendant of Mr. Dawes, and he was startled by an article in this Magazine for May, 1875, upon the expedition to Concord, which made Ebenezer Dorr the companion of Revere—a statement which was repeated in the centennial oration of that year at Concord. It was undoubtedly a misapprehension, as the fact of Dorr's agency proved to be unknown even in his own family. Mr. Holland has improved the occasion, however, to write a very interesting sketch, to which he adds a copious and illustrated genealogy of the Dawes family, and in the course of which he deprives the story of Revere's ride of one of its most striking incidents. Mr. Holland exposes the general error that Paul Revere was himself warned by the lights hung in the Boston steeple. The truth is that Revere caused them to be hung there to apprise those who were on the Charlestown shore of the departure of the British. It was after Revere, who was still in Boston, knew of their departure that he crossed the river.

The probability of the essential justice of the destructive criticisms upon familiar traditions is shown by the fact that such a point as this should have been always misapprehended, and that although the event was but a hundred years ago, and was described by the chief actor, there should be a question as to the church upon which the lantern was hung, and as to the person who hung it. The only contemporary accounts are those of Revere himself and Richard Devens, and they both speak of "the North Church." But the building known at that time as "the old North Meeting-house" was so called because it was not a "church," or house of worship of the English Church, while Christ Church, which from its situation and other circumstances would naturally have been selected, was sometimes called the North Church. Moreover, it was the sexton and a vestryman of Christ Church who were arrested by the British, and tradition has always favored Christ Church. As to the person who hung the signal lanterns out of the belfry, which was a most daring and hazardous deed, Mr. Holland follows Mr. John Lee Watson, of Orange, who in an excellent paper, originally communicated to the Boston *Advertiser* in July, 1876, makes a very strong case for John Pulling, the vestryman, as against Robert Newman, the sexton, to whom the act has been generally attributed.

Mr. Holland's sketch of William Dawes is the portrait of a "high son of liberty," like Revere, and Prescott, who, when Revere was stopped by the British beyond Lexington, leaped his horse over a stone wall and spurred on to Concord. The monograph is timely and valuable, because it states simply and accurately, in the light of all the evidence, and with a clear perception of all the misconceptions, the facts of the inspiring and heroic story. Whatever befalls Belisarius, and Abelard and Héloïse, and the Colossus of Rhodes, and William Tell, the two lanterns of Paul Revere will always flash the signal to the Charlestown shore, while he rides at full speed through the April night, rousing the country as he goes.

The Easy Chair of the oldest of our popular magazines looks with interest upon the changes that are constantly occurring in periodical literature, and all of which are significant. Twenty-six or twenty-seven years ago, Dr. Griswold, the editor of a magazine, wrote to Percival that he would gladly pay him ten dollars for any poem that he would send him, and that there might be no limit to the generosity, he assured the shy and solitary poet, to whom ten dollars was always necessary, that the offer should remain open at his pleasure. Since that day Mr. Bonner, of the *Ledger*, has paid Halleck and Longfellow something more than ten dollars for a single poem of moderate length, and Dickens a hundred times

ten dollars for a short story. Our own Maga long ago led the way in beating up recruits among European authors. The most famous English novelists of this generation have made their bow to America in our pages, and in writing his admirable article for the *North American*, Mr. Gladstone but followed Castelar, who in his *Harper* series gave us a most striking picture of European republicanism.

Within a few years the general character of the monthly magazine has singularly changed. It still retains much of its light and entertaining touch; it is still amusing and delightful, and has not lost its "parlor-window" aptitude, but it has added to it a weight and value of another kind. It has become a guide and instructor as well as a gay and lively companion. Indeed, the intellectual and scientific, the moral and political, movement of the time can now best be studied in the monthly magazine. Not only the chief poets and story-tellers publish their works first in the magazine, but statesmen and divines, the leaders in science and philosophy, hasten to place upon its pages the latest thought and the most recent discovery. The masters in every department of intellectual activity now address themselves to the public in this way, because they feel instinctively that it is the surest way to the public mind and heart. Literature of every kind has so accumulated, and the means of communication with the public have so wonderfully increased, that to wait to write a book is to risk the general attention which the question demands.

The fear that this may lead to superficial treatment, even if well founded, is set off by the necessity of clearness and condensation. The perplexing question has long been, Who will concentrate great libraries into a few books? If a man would be heard or read—that is to say, if he would make his knowledge useful—he must now make it compact and of attractive form. Nor can a master be superficial. The editor of the magazine or periodical, therefore, now seeks to enlist writers in every kind, whether they have been known as writers or not. There is undoubtedly some of the old lyceum feeling in the new editing—the conviction that the course must be filled by noted and conspicuous men, whatever the reason of their notability. But in any case politics must be discussed by conspicuous statesmen, questions of science by eminent scientific men, and questions of theology by famous theologians. Yet a few years ago politics and science and theology were not welcome in the magazines. They were left to the forum, to the lecture-room, the newspaper, the pulpit, and the book. At this moment Mr. Gladstone adds to his other renown that of being the most affluent and desirable magazinist in England, and unquestionably there is no other way in which he could speak so satisfactorily and so immediately to so immense an audience. Indeed, the change in periodical literature is shown most strikingly by the fact that a man like Mr. Gladstone is the typical magazinist to-day, and a man like Charles Lamb sixty years ago.

It is now necessary, as we said, for any one who would keep pace with the various movements of the time to read the magazines. The feeling that much reading of newspapers "fritters away" the mind is true only of the reading of petty personal politics and of accidents and gossip. There has been recently as sound and valuable writing upon financial subjects in many of our own newspapers as there is in Adam Smith, or in any other more modern master of economical and monetary science. And there is no more significant or promising fact than that by the change of which we are speaking the freshest, fullest, and most valuable thought and result are brought cheaply and alluringly to the hand and eye of every one who can read. It is by no means "a waste of time," therefore, to read "the current periodical literature of the day;" it is the only way by which the general reader can keep himself well informed. Special students will of course pursue their special studies, and they too will find the articles of which we speak a necessary part of such studies.

These reflections suggest an improvement of the text appropriate to the season. For what can be a more delightful gift—a gift of perpetually renewing delight to any intelligent friend—than a year's subscription to some one or more of these entertaining and instructive periodicals? Modesty naturally forbids the mention of one popular and interesting magazine as peculiarly fitted for such a gift, but among many the well-meaning philanthropist can not go astray. Especially at this Christmas season, when the conflict of choice is so incessant and exasperating, when the mind is tossed uncertain from the Japanese bazar to the jewellers' cases, and from the decorative art rooms to the picture-gallery, when even the wares of the furnishing store masquerade as *objets de virtu*, and the usefulness of many gifts is lost in their beauty, what can be more tranquillizing and more reasonable than a resolution to provide for the beloved recipient of a prospective present a charming surprise for every month in the year, with a train of new and wider knowledge? This is contained in the modest subscription to a periodical of the kind we have mentioned—a mirror of the age, a microcosm of contemporary genius and research and thought, a handy library, a vinaigrette of the very attar of current wit and wisdom.

In the number of this Magazine for November, 1867, there was an article by our old-time and welcome correspondent "Porte Crayon" (General D. M. Strother), called "Personal Recollections of the War." It was written when feelings were warm, and when, necessarily, evidence could not always be weighed properly and justice done. There were some statements in the article which reflected upon the conduct of General Fitz-John Porter on the field of the second Manassas battle, and which have been since cited to his injury in many quarters. But various facts having been called to his attention, General Strother carefully went over the subject in the light of fresh knowledge, and having found reason to reconsider his earlier conclusions, has addressed a letter to General Porter withdrawing his original statement. The letter is dated on the 4th of July, 1878, and its publication has been delayed until all the testimony before the Board of Inquiry into the case of General Porter had been submitted. That case having been closed, although, as we write, no decision has been rendered, we very gladly publish General Strother's letter. Whatever may be the judgment of this tribunal upon the justice of General Porter's condemnation by the first board, a letter like that of General Strother throws a light upon the possibility of serious error in the estimate of that conduct of General Porter which

has been so severely censured. The subject was very carefully and fully investigated, with all accessible testimony, by the authors of *Harper's Pictorial History of the Rebellion*, and they were unable to reach a conclusion of decided censure. The persistence of General Porter in seeking a re-opening of the case, with the risk of confirmation of the original judgment, shows a confidence in the rectitude of his conduct which certainly commends him to the good wishes of the community.

"BERKELEY SPRINGS, WEST VIRGINIA,
July 4, 1878.

"*General Fitz-John Porter:*

"DEAR SIR,—Your courteous letter calling my attention to the fact that a certain publication of mine has done you much injury, and is still used to your detriment, furnishes me the desired opportunity of fulfilling a duty to you, to myself, and to the public, by correcting an error into which I had inadvertently fallen, and may have led others.

"In the ninth paper of my 'Personal Recollections of the War,' which appeared in *Harper's Magazine* of November, 1867, in summing up the incidents of the battles near Groveton, 28th, 29th, and 30th of August, 1862, I made certain statements respecting the movements and position of the enemy's forces, as follows: 'On the morning of the 29th, General Lee took breakfast at a house west of Thoroughfare Gap. Riding forward rapidly, they passed Longstreet, moving through the Gap at the head of the column, some short distance on the eastern side. They marched left in front, Hood's division leading. This division reached the field and formed on Jackson's right after sunset on the 29th, and immediately thereafter became engaged with a portion of M'Dowell's command, as before stated. Other portions of Longstreet's command arrived and took position during the night. On the morning of the 30th (Saturday), Longstreet's command was all up except Anderson's division, which had not yet reached the field. The absence of this division, and a feeling of uncertainty as to Porter's forces and intentions, induced General Lee to remain on the defensive during the forenoon of Saturday. About one o'clock P.M. Anderson arrived, and the rebel commander immediately commenced his preparations for an aggressive movement.'

"The information upon which this statement is founded, derived from a conversation with one of General Lee's staff officers, and incidentally corroborated by other Confederate officers who participated in the actions, seemed to me at the time so satisfactory and conclusive that I felt justified in accepting it as history.

"Since that time I have had conclusive proofs that this theory of the enemy's movements could not be sustained. I have therefore concluded that there must have been an entire misunderstanding between that officer and myself, and without permitting any question of the sincerity of either party in the conversation, I am now convinced that the statement, as published, is erroneous in all important particulars, and that all reflections upon your conduct based upon it must be reconsidered.

"I am, very respectfully, yours,
"DAVID H. STROTHER."

Editor's Literary Record.

THE second edition of President Porter's book on *American Colleges*[1] is made doubly acceptable by a considerable supplement of new and timely matter bearing upon the subject of liberal education. In an interesting preliminary chapter he recounts the indictments that have been urged against our college system during fifty years past, and outlines the changes which have been wrought in it by innovations upon the methods of the older institutions or by the establishment of new ones. Among other particulars he shows that these changes tend toward the substitution of the system of elective studies for a fixed uniform classical course; a larger infusion of utilitarian at the expense of classical studies; and, at a similar cost, greater prominence to English literature, the modern languages and modern history, civil and political law, natural history, mechanics, and the applied sciences. The conclusion at which he arrives is, that while our college system is not faultless, but is susceptible to important improvements, yet its principal features may be triumphantly vindicated. This is the task with which Dr. Porter grapples in fourteen able papers, in which he considers *seriatim* the distinguishing features of our colleges, ranging his inquiries under the following heads: the studies to be pursued, the curriculum to be enforced, the relative value of text-books and lectures, the advantages and evils of the common life of the college and of the dormitory and class systems, the religious character of colleges, and their relationship to one another and to schools of science. He maintains that for the years appropriated to school and college training there is no study so well adapted to mental discipline as the study of language, and that the study of the classical languages is the best form of this discipline; that the curriculum should be a prescribed but not absolutely inelastic one, and should not be left to the option or caprice of an inexperienced student; that instruction by lectures, though attractive to the teacher who consults his ease, is not as profitable to the pupil as recitations from text-books; that daily recitations are preferable to occasional examinations, inasmuch as they require more constant training and application; that the community life of the college is refining and strengthening to the manners, the morals, and the intellect; that residence in dormitories is more energizing and liberalizing, safer morally, and less expensive than residence in lodgings. Other chapters are devoted to the more general questions of the constitution, government, and administration of colleges; and in addition there are six brief "after-thoughts," in which the author brings together the latest results of his ripe observation and experience, on

[1] *The American Colleges and the American Public.* With After-Thoughts on College and School Education. By NOAH PORTER, D.D., LL.D., President of Yale College. 12mo, pp. 403. New York: Charles Scribner's Sons.

the importance of good preparatory schools, on the class system, on classical study and instruction, on the manners and morals of colleges, on the ideal American university, and on the co-education of the sexes.

Of less intrinsic value than President Porter's thoughtful inquiries, and more in the nature of a hand-book for the information of parents and students, is Professor Thwing's little volume entitled *American Colleges*.[2] This information takes the form of a recital of the studies pursued, the instruction dispensed, and the expense incurred in certain specified colleges, and comprises a running comparative view of the characteristics of each.

In four strong essays Professor Hitchcock describes the origin, development, nature, and tendencies of *Socialism*,[3] and its monstrous outgrowth Communism, and depicts the instrumentalities, material, moral, social, financial, industrial, and political, which have given both an increased momentum at this time, and have elevated one of them into a "terrible menace" against civilized society. The subjects of the several essays are "Socialism in General," "Communistic Socialism," "Anti-Communistic Socialism," and "Christian Socialism;" and in them the distinctive and sometimes antagonistic qualities of each, and also their distinguishing characteristics for greater or less degrees of evil in different lands, are discriminated and analyzed with great clearness.

The letters of a man to the dearest members of his family, if they fail to show us all the sides of his character, have at least the merit of presenting portions of it, either the best or the worst, in their natural colors. We may be sure he is not posing in them for public effect, or masking his thoughts and feelings to promote or defeat a party or a policy. The *Letters*[4] of Bismarck to his wife, sister, and others are emphatically of this kind, and their unstudied periods place the astute diplomatist and iron-willed minister in far more engaging lights than those in which he is usually painted. Written during his youth, during the first years of his marriage, during his diplomatic missions to foreign governments, during the period of the Parliamentary struggles in Germany, during the Austrian war, and from before Sedan, the most of them were addressed to his wife or sister, and there are a few to intimate friends. Those to the former two are peculiarly genial and unrestrained, and exhibit his native playfulness, his habit of extracting pleasure from trifles, his tenderness and humor, his garrulous and affectionate responsiveness, and his hopes, feelings, and aspirations. In some of the earliest of these he playfully and almost prophetically pictures himself as the peer of princes, or as rendering important services to the state. Those which are the most attractive, however, are the ones in which he busies himself with home affairs, and reveals his filial reverence, fraternal affection, and absorbing conjugal love. Two of the latest in the collection belong to another class, and are very remarkable, the one being an earnest response to a question put to him "in Christ's name" by a person whom he esteemed, in which he declares his faith in Christ and reverence for religion, and defends the motives that inspired his political actions; and the other, written to his wife just after the battle of Sedan, gives his estimate of the effects of that decisive conflict, and describes his memorable interview with the fallen Emperor on the morning after the battle.

There is an agreeable blending of personal *ana* of the man and appreciative criticism of the poet in Mr. Calvert's *Study of Wordsworth*.[5] Indeed, its chief attractiveness is due to the skill with which the author shows how the writings of the poet influenced the character and intellect of the man, and again how his poetic communings and outpourings took their hues from his personal character. The volume carries us over some of the most interesting events of the poet's life, introduces us to some of his most treasured companionships, and admits us to familiar views of him while engaged on his most celebrated poems. Besides, there are copious versions of Wordsworth's critical estimates of other poets and of himself, and genial criticisms, estimates, and analyses of the poet's greatest productions.

The five individuals introduced to us in Mr. Hamerton's *Modern Frenchmen*[6] are so nearly unknown, even as celebrities, to American readers, that their biographies lack an important antecedent element of interest. This drawback is amply compensated for, however, by the skill with which Mr. Hamerton piques our curiosity, and the tact with which he conciliates our sympathy and excites our admiration for the personages he depicts. The subjects of the sketches are Victor Jacquemont, an eminent traveller and naturalist, whose life was devoted to science and humanity; Henri Perreyve, an ecclesiastic and orator, who combined singular purity with greatness of religious power and commanding qualities of leadership; François Rude, great as a sculptor, but devoted to the austere duties of home and family; Jean Jacques Ampère, an industrious historian, archæologist, and traveller; and Henri Regnault, a glowing painter and zealous patriot. All were men of vigor and intensity, whose tenacity of purpose overcame apparently insuperable obstacles, and whose engaging personal qualities won the love of all who came in contact with them. Mr. Hamerton paints the personal, social, and intellectual characters of these men with a loving hand; and his sketches possess the high merit—which gives value to the best biography—of encouraging effort and stimulating emulation in things worthy by the influence of noble examples.

It would be difficult to find two more agreeably contrasted revivals of the romantic literature of a by-gone generation than are furnished in late numbers of the "Franklin Square Library," reproducing Miss Burney's *Evelina*[7] and Fonblanque's

Bachelor of the Albany.[8] The former, after the fashion of the novel of the Richardson school, spins out the thread of her delightful verbosity into an exciting detail of the fluctuating pangs and delights of love, and keeps the reader on tenter-hooks of suspense by the recital of the numberless trying or provoking mutations which befall its rather verdant, but beautiful, much persecuted, and ultimately happy heroine. The other, with the grim or sparkling wit and polished antithesis that characterized the literature of a later day, portrays the forced relentings of a cynical and woman-hating bachelor under the combined influences of a genial English home, and of a bright, spirited, lovely, and arch-tongued English girl. The trying situations of the heroine in *Evelina*, which test her love and develop and solidify her character, and the whimsical dilemmas and comical incidents and mishaps which befall the crusty bachelor of the Albany, and tumble his edifice of sybaritic self-enjoyment to the ground, belong to widely opposite regions of invention, and represent widely different as well as distant stages in the development of our modern novel.

Mr. James discriminates judiciously when he styles *The Europeans*[9] a sketch rather than a novel. It is, indeed, a series of brilliant sketches, held together by a slight thread of continuity, but lacking the intimate fusion of parts essential to narrative or dramatic unity. Mr. James describes street scenes, houses, gardens, and country sights and sounds better than he does human characters, apparently because the former are conscientious copies from a model, while his men and women are fictions of the intellect merely, whom he makes known to us by description and assertion instead of by the natural unfolding of their dispositions and characters through the medium of their thinkings and sayings and doings. Interesting studies, therefore, as his portraitures in *The Europeans* unquestionably are, and although his actors are cleverly conceived and placed in lights and situations ingeniously contrived to afford entertainment, they do not seem sufficiently real to rouse our sympathies and to give the semblance of probability to fiction.

The reader of *Auld Lang Syne*[10] will pay it the involuntary compliment of wishing it twice as long as it is. There is not a dry or tedious page in it; its characters are strongly contrasted or harmoniously blended; and its incidents are exciting and dramatic without being sensational. The scene is laid in an old English sea-coast town, just after the battle of Trafalgar, during the struggle between England and France for the naval supremacy, and the narrative is largely colored by the stirring events by land and sea that were then being enacted. The story hinges upon the innocent loves and secret marriage of two inexperienced young people belonging to widely different stations, for whom our sympathies are enlisted by their excellences of mind and person, and by the sore trials and sorrows resulting from their irregular step. The style reminds us of that most fascinating story-teller of modern times, the author of *Lorna Doone:* there is the same lavishly beautiful descriptions of natural objects, the same collocations of neatly quaint or novel and expressive phrases, the same trick of packing sentence within sentence like a nest of boxes in a cabinet, and the same wizard faculty of unfolding a story so that we forget that it is fiction.

Three more charming or more thoroughly healthful stories than those from *An Old Dutch Town,*[11] by Rev. Robert Lowell, are rarely met with. Graceful and tender, gravely quaint or brightly gay, gently sad or lambent with humor, they are also aromatic with the odor of a not too distant antiquity, which imparts to them the sweetness of a ballad or a legend. Each of them embodies some passages, real or traditional, in the life of a half-slumbering Dutch town in the interior of the State of New York, and describes the various folk who moved therein some fifty or a hundred years ago, together with their old habits and customs, old houses, old ways, old furniture, and old-fashioned sayings and doings and dealings. The first of the stories is entitled "Abram Van Zandt, the Man in the Picture," and its plot is built round a weird fancy of one of its characters that the figure of a man dimly descried in one of the corners of an old picture by Vander Velde, which had come into his possession under peculiar circumstances, exerted an influence upon his actions and destiny by means of some mysterious affinity of identity. The second story of the series is a love tale, remarkable for its powerful contrasts of light and shade, of overflowing gladness and melting sorrow. The last is a quaint realistic painting of character and manners, abounding, as do both the others, in descriptive episodes of great delicacy.

The author of *Cupid and the Sphinx*[12] contrives very cleverly to kill two birds with one stone. While he entertains us with an animated transcript of his experiences in Egypt, and of the impressions made upon him by its people and antiquities, he also weaves for our amusement a quiet though not uneventful love story, which is none the less attractive for being composed of several strands. It might be objected that there is an excess of sentimentality in the abstract and of intellectual rhapsodizing, and that the dialogue is sometimes inconsequential and pedantic; but still the romance challenges our sympathies, and many of the incidents which give it shape and color are spirited and natural.

One of the most difficult of tasks is properly and with due brevity to characterize a novel which is without striking merits or defects. Such novels are as hard to define or classify as the average men and women who make up the mass of mankind—who are conspicuous neither by their virtues nor vices, their beauty or ugliness, their abilities or performances, and whose lives, if not absolutely level, never rise to any great heights or sink to any considerable depths. Of this neutral tint are the two novels, *A Woman's Word*[13] and

Margery's Son,[14] the former an indigenous production, and the other an exotic. Neither is noteworthy as a work of art, both are mildly interesting, and the atmosphere of each, though not strongly bracing, is pure and sweet. The one first named is a love story of the conventional type, whose action vibrates between town and country, and whose hero and heroine, after having been subjected to ingenious and prolonged torture, are at last made supremely happy. The other is a tale of the court of Scotland, and incidentally of the court of England also, founded on incidents in the life of Robert III. and his sons the Duke of Rothesay and James I. Portions of it turn upon the spread of Lollardism among the nobility, and the perils attending its espousal by certain of them who are prominent figures in the story. A love story of moderate interest underlies the historical revival; its style is simple and unaffected, and its representations of contemporaneous manners and events deserve credit for their general fidelity.

There can be no incertitude as to the place in literature to which Mr. Black's *Macleod of Dare*[15] belongs. It is a genuine novel; fresh, powerful, and dramatic, large in design, ample in detail, and rich in coloring. Its movement is free, its situations diversified, its dialogue natural, pointed, and always promoting the progress of the story, its descriptions picturesque and contributing to the general effect, and its narrative connected and rising steadily in power and interest as it is unfolded and approaches the *dénouement*. Although its *dramatis personæ* are numerous, not one of them is insignificant or superfluous, and all are justified by some indispensable artistic requirement. The statuesque figures of the grand old mother of Macleod and of his patient cousin Janet, as we see them against the background of their bleak home at Castle Dare, surrounded by the faithful servitors and clans-people of their race, are in fine contrast with the lithe and winning women of a softer clime, to whom we are introduced amid their luxurious surroundings. Macleod himself is a massive and virile figure, who attracts us by a hundred simple and vigorous virtues. The heroine is less attractive than Macleod in the proportion that she is a more composite creation; but she is invested by the skill of the artist with so many rare charms, each so opposite to the other, yet all appealing with so much subtlety to the romantic imagination of the impressionable and single-minded Scot, and mutely seeming to invite the interposition of his protecting strength, that we do not wonder that he loved her with an enthralling passion, or that when he realized the hopelessness of his love his mind became distempered, and drove him to an act of fatal desperation.

If the anomalous mother and daughter who are the chief figures in Mr. James's *Daisy Miller*[16] were seriously presented by him as typical representatives of our country-women—while admitting that such a mother and daughter are as much within the range of possibility as the Siamese Twins, and have as equitable a title to be set up as types—we should affirm that they have not enough of general or special resemblance to any really existent class to lend probability to caricature. It is obvious, however, that Mr. James had no such purpose in this brilliant and graceful trifle. The elder lady is an impossible mother—abnormally insipid, colorless, and unobservant or careless of her beautiful daughter's wayward doings; and Daisy herself is an equally impossible daughter, who regards her mother as a cipher, and who, besides, is an inscrutable combination of audacity and innocence, elegance and vulgarity, refinement and cool disregard of essential conventionalities. Nevertheless, this contradictory creature under the author's pliant fancy becomes a "phantom of delight," whose changeful and winning ways and fresh and flower-like beauty veil all her defects and heighten her abundant graces.

There is a romance of reality in the story of *The Virginians in Texas*[17] that is very attractive, and must please while it instructs the "young old folks and old young folks" to whom it is inscribed. It is founded on the transplantation of an old and impoverished Virginia family to Texas, and describes with graphic minuteness the process of their removal thither, and the steps pursued by them in re-establishing their uprooted home in its friendly virgin soil. Their mishaps, enjoyments, surprises, and adventures, grave and gay, are told with vivacity, and the descriptions of their work in building their house and getting their "league" under cultivation are replete with entertaining and useful practical hints and examples for other new settlers. Interspersed throughout the relation are stirring stories of pioneer frontier life, including combats with savages, beasts of prey, "northers," and prairie fires; incidental descriptions of the beasts, birds, game, reptiles, insects, plants, and flowers peculiar to Texas; and absorbing episodes in which are recounted as by an eye-witness and participant exciting passages in the history of Texas.

Eulogy of the living is ordinarily regarded with distrust, especially if its subject be wealthy, titled, munificent, and the occupant of an official station from whence golden streams of patronage may be expected to flow in the direction of the panegyrist. This distrust is not excited, however, by the warm commendation which is liberally bestowed upon Lord Dufferin by Mr. Stewart in his interesting volume on *Canada under the Administration of the Earl of Dufferin*,[18] since its utterances have been withheld until the termination of the official power of that popular and able ruler, and with it his ability to recompense words of praise by substantial rewards. Mr. Stewart's protracted panegyric of Lord Dufferin as a man and as a ruler is entirely free, therefore, from suspicion as to the motives which inspired it, and is evidently as sincere and disinterested as it is

hearty and glowing. Although there is a brief preliminary sketch, rapidly outlining the life and family connections of Lord Dufferin, and recounting his various official services, the volume is really confined within the limits of about five years, from the summer of 1872 till the autumn of 1877, covering the period of his viceroyalty of the New Dominion; and it gives a close view of all his public acts and of his social, literary, personal, and political doings during that time, including many of his able speeches and addresses, and the hearty congratulatory receptions that were tendered to him at the outset and close of his viceregal career. The reader will be impressed by the grave difficulties which it was the task of this able administrator to encounter, and by the signal tact, moderation, energy, and judgment which he brought to bear upon it. A new and as yet scarcely coherent dominion, which existed practically only on paper, whose parts were remote from each other, and whose interests often clashed, had to be fused into a symmetrical unit. Conflicting interests were to be reconciled, exasperating frictions to be removed, and the complicated machinery of a representative government was to be set safely in motion. Urbane, social, rich, and munificent, and to these attractive personal qualities uniting firmness, intellectual vigor, great patience, and invincible good nature, the wisdom that came from experience in dealing with provincial peoples and the faculties of practical statesmanship, Lord Dufferin easily won his way to the hearts of the people of Canada, and so securely gained their confidence that through all the changes and exasperations of party his purity was unquestioned, his popularity unbounded, and his influence supreme. Mr. Stewart's volume recites all the great acts of policy and the most stirring events that signalized Lord Dufferin's administration, and on this account is a valuable contribution to political literature. It is, however, the things personal to Lord Dufferin and his accomplished wife, and the insight which is afforded of social, domestic, and political life in Canada, that will make the book most attractive to the general reader. Our reflection on laying down this really valuable volume is that the new viceroy and the Princess Louise will have a far less difficult task to perform than awaited their predecessors. It is true there are here and there local jars and frictions which will call for careful and wise management, but Lord Dufferin leaves the machinery generally in smooth and good working order, the people contented with and beginning fairly to understand it, the conflicts of interest between the different provinces adjusted, and the country busy, prosperous, and growing. Unless, then, the Marquis of Lorne is greatly more incapable than he is represented to be by Lord Dufferin, who has known him from childhood and is a capable judge of his abilities, we may prognosticate for him and his royal bride as fortunate an administration as the one whose history is related in this able volume.

Mr. Day's *Outlines of Ontological Science*[19] is a welcome addition to metaphysical literature, and will be found of special service to students, whose labors it will lighten and whose perplexities it will relieve. In his attempt to concentrate the light of philosophical research and speculation on the fundamental questions, what is true knowledge, how can it be validated, what are its boundaries and departments, and what are the relations of these departments, the author arrogates no credit for novelty, but simply aims to harmonize the diversities of recent scientific discussion, and to bring them under a comprehensive survey, where they may be viewed in their clearly legitimated results.

The "innumerable caravan" of wives, mothers, sisters, and daughters who are daily confronted by the problem what they shall have for dinner to propitiate the exacting palates of their husbands, fathers, sons, and brothers, will have a heavy burden lifted from their shoulders by Mrs. Terhune's *Dinner Year-Book*.[20] This practical domestic hand-book does almost every thing save provide and pay for our dinners for seven days of four weeks in each month of the year, the bill of fare prescribed being adapted to the capacities of the average American market, with the meats, fish, vegetables, and fruit each in its season. Throughout, the dinners proposed are appetizing, elegant, and economical; each of them is accompanied by a receipt for every dish, and there are sensible directions for placing them on the table. In addition to the other dinners there are bills of fare for twelve "company dinners," one for each month; but we look in vain for similar aids toward Thanksgiving, Christmas, and New-Year's dinners.

A title more aptly expressive of the contents could scarcely have been devised than that which Dr. Cuyler has given his excellent volume of *Pointed Papers*.[21] Each of its papers is so brief that it may be read in a few minutes, so plain that it may be readily comprehended and easily retained by the most untutored, so elevated and thoughtful as to satisfy the demands of the most cultivated, and so practical as to meet the spiritual needs of the sinful, the penitent, the sorrowful, or the devout. The series comprises a succession of wise teachings adapted to almost every phase of Christian duty and to nearly every step of Christian growth.

Among the most useful and interesting of recent publications are four little hand-books respectively on bees, flower-painting, the studio arts, and the telegraph. The first of these is entitled *The Blessed Bees*,[22] and has a special interest for farmers and others who have the space and facilities requisite for rearing bees. It is a practical account of the methods pursued by its author, with great success, in raising bees, and gives minute details as to their breeding, hiving, transferring, pasturing, and multiplication, together with the expenditure involved and the profits earned. The subject is deprived of all dryness and made as entertaining as a story by an accompanying narrative of personal effort, investigation, and industrious application.—Another of these little volumes is a reprint of Mrs. Duffield's guide to the *Art of Flower-Painting*,[23] in which

[22] *The Blessed Bees.* By JOHN ALLEN. 12mo, pp. 69. New York: G. P. Putnam's Sons.

[23] *The Art of Flower-Painting.* By Mrs. WILLIAM

we are instructed in the drawing of flowers, the materials used and the processes employed in painting them, and also in those more technical branches of the art—composition, arrangement, form, light and shade, and background.—The third[24] is a concise compilation of the best rules of art from the best authors, and is intended as an aid to those who wish to be introduced to an "outside knowledge" of art. Among the topics discussed are art and its divisions, technique and expression, the progress of art from ancient till modern times, books on art, and biographies of famous artists.—The last of these convenient volumes is a brief and clear presentation of the principles of the *Electro-Magnetic Telegraph*,[25] designed for the benefit of practical operators and students of telegraphy, and comprising concise expositions of electricity and magnetism, the Morse telegraph, batteries, practical telegraphy, and the construction of lines.

Although the literary execution of Mr. Bailey's *England from a Back Window*[26] is rather inelegant, it will be relished, by all who have visited England, for the brevity and fidelity of its sketches and descriptions, and by all who have not, for its crisp humor and abundant good nature. Nothing escapes the quick and observant eye of its author, but he is specially on the alert to detect those peculiarities which denote the differences between England and Englishmen and our own country and countrymen. He describes with freshness and vivacity every thing that is curious or venerable or admirable or characteristic, and, without being in the least guide-bookish, his volume is the best and most satisfactory cicerone that a person visiting Great Britain for the first time could be provided with.

Decidedly full of interesting and practical information is Mr. Mason's *Old House Altered*,[27] in which he shows how an old family house may be enlarged, modernized, and converted into a comfortable and elegant home without destroying its associations. In the form of a series of agreeable familiar letters between a brother who is supposed to be a professional architect and a sister who is an amateur, aided by the occasional interposition of another brother as an umpire, we are first given tentative sketches in which the house-mistress roughly outlines the things essential to comfort and convenience. These are then amended, added to, and embellished, till a house results that meets every requirement. The letters and sketches form an elaborate discussion and selection of all that is best in the construction of a family home, having regard primarily to health, use, and comfort, and secondarily to elegance and adornment.

Among publications designed for the amusement and instruction of children, the one by Mr. Coffin, appropriately dedicated to "the boys and girls of America," and entitled *The Story of Liberty*,[28] is conspicuous for its beauty, lucidity of style, and intrinsic worth. With excellent engravings on every page, not one of them is a mere random picture intended to please the eye only, but each happily illustrates and fastens in the memory some memorable historical act, event, or character referred to in the text. Written so simply that the youngest pupil may understand it, nothing of strength or grace of diction is sacrificed to bare simplicity. Though its narrative is glowing, it yet adheres to the literal fact; and thus while it has the attractiveness of a story, it has also the substantial usefulness of historic reality. The book supplies a need that has been strangely overlooked; for with our multiplicity of histories for the young there has been nothing hitherto, adapted to their capacities, outlining the growth of civil and religious liberty, or tracing from their feeble beginnings the free institutions we now enjoy. It was this task which Mr. Coffin by a happy inspiration set himself to perform, covering the period of five hundred years—from the time of King John and Magna Charta to the settlement of Jamestown, the arrival of the *Half-Moon* in the Hudson, and the landing of the Pilgrims. And although the history of the growth of an abstract principle into a concrete system, as was that of civil and personal liberty, might seem to be a dry and uninviting subject for the young, Mr. Coffin has enriched the relation with such a succession of grand or stirring incidents, and has crowded it with such a body of stately actors, that it can not fail to excite their interest and captivate their attention. Along with the record of the progress of liberty, the narrative branches off into inviting episodes commemorative of the great historical events that contributed to its advance, such as the invention of printing and the mariner's compass, the discovery of America, the translation of the Bible by Wycliffe, and the crystallization of the English language into its present forms by him and Chaucer, the Reformation in Europe, and the great wars and leagues which resulted from it. No more absorbingly interesting or more substantially useful book than this can be placed in the hands of the young, whether at home or in school; and, moreover, there are few parents who may not derive pleasure and enlightenment from its perusal.

Another exceeding sensible and very useful book is a little volume entitled *Grammar Land*,[29] which is dedicated to all children who think grammar hard and dry, and which aims to throw a gleam of sunshine around our little men and women while they are engaged in that most wearisome of studies. In the most engaging manner, by parable and simile and easy metaphor and still easier matter-of-fact application, it clears up the puzzles and simplifies the hard things of grammar. Separate chapters are given to biographical sketches of rich Mr. Noun and his useful friend Pronoun; little ragged Article and talkative Adjective; busy Dr. Verb, and Adverb; perky Preposition, convenient Conjunction, and tiresome Interjection—with full accounts of their pedigrees and connections, oddities and peculiarities.

Duffield. Edited by Susan N. Carter. 12mo, pp. 46. New York: G. P. Putnam's Sons.

[24] *The Studio Arts.* By Elizabeth Winthrop Johnson. 18mo, pp. 161. New York: Henry Holt and Co.

[25] *A Hand-Book of the Electro-Magnetic Telegraph.* By A. E. Loring. 18mo, pp. 98. New York: D. Van Nostrand.

[26] *England from a Back Window.* With Views of Scotland and Ireland. By J. M. Bailey, the Danbury News Man. 12mo, pp. 475. Boston: Lee and Shepard.

[27] *The Old House Altered.* By George C. Mason. 8vo, pp. 179. New York: G. P. Putnam's Sons.

[28] *The Story of Liberty.* By Charles Carleton Coffin, author of *The Boys of '76.* Illustrated. 8vo, pp. 404. New York: Harper and Brothers.

[29] *Grammar Land; or, Grammar in Fun.* By M. L. Nesbitt. 12mo, pp. 120. New York: Henry Holt and Co.

Editor's Scientific Record.

Astronomy.—Dr. Peters has discovered Asteroids 191 and 192 since September 22. They are his thirty-first and thirty-second planets.

The reports from the various observers of the solar eclipse are coming in. Professor Young has printed his in *Silliman's Journal* (September), and Dr. H. Draper in *Franklin Institute Journal* (October). The Naval Observatory parties are preparing their reports. In this connection it may be mentioned that the photographs of the Naval Observatory expeditions give a complete account of the corona. The very fine photographs taken by A. Clark, Jun., of Professor Harkness's party, and Mr. J. A. Rogers, of Professor Hall's party, give the details and structure of the inner corona to perfection, and are all that can be desired. The outer corona is given on these for 25′ each side of the sun. The photograph of Mr. Peers, of Professor Holden's party, gives more of the outer corona than any other (over 1° each side the sun). A combination of these photographs will give the best knowledge of the whole phenomenon yet possible.

One of the most important papers of the year is by Professor Newton, of Yale, on the "Origin of Comets." It is impossible to give here an abstract of this paper, which is itself a series of propositions, each in a condensed form, and each closely connected with every other. We can only refer to this as a body of doctrine which will become the *Principia* of this subject.

Volume IV. of the Moscow Observatory (Dr. Bredichin, director), 1878, has arrived in this country. It is in quarto form, and in two parts. Part I. contains: 1. Meridian circle observations of stars of a selected list. 2. A second memoir on the anomalous forms of comets' tails, by Professor Bredichin. This deals with Comet 1861, II. 3. Meridian observations of Mars in opposition and comparison stars, by M. Gromadski. These observations extend from July 18 to September 24. The probable error ($\Delta\delta$) of a single observation is $\pm$ 0.58″. Each observation of this series combined with one of the same weight in the southern hemisphere would give the solar parallax with a probable error $\pm$ 0.19″, and hence from twenty such corresponding observations we may expect a value of this doubtful by $\pm$ 0.04″. 4. This section is devoted to meridian observations of a special list of stars. 5. Spectrum of Comet 1877, *b*. Dr. Bredichin finds this to be: A, 556.4 $\pm$ 1.7; B, 515.4 $\pm$ 0.7; C, 469.7 $\pm$ 2.2. For Coggia's comet these numbers are: A, 563.0; B, 516.0; C, 471.1. For the spectrum of *benzine* they are: A, 563.2; B, 516.4; C, 471.2. Part II. contains: 1. Observations of Mars and comparison stars with the equatorial. 2. Measures of stars in the cluster in *Perseus*. 3. Photometric observations with a Zöllner's photometer; observations of comets, of bands on Jupiter, of a lunar eclipse, etc., and some photo-heliographic observations.

In the Harvard College Library Bulletin No. 9, October 1, 1878, is printed a list of books and memoirs on the transits of Mercury, from 1631 to 1868, inclusive, with notes by Professor E. E. Holden. It has above 150 authors' names.

At the Seagrave Observatory, Providence, Rhode Island, Mr. L. Waldo has observed *Mimas* on several nights with an 8-inch Clark refractor. This is almost the smallest aperture with which this faint satellite has been seen, although Captain Jacob at Madras appears to have observed it with a 6-inch Dollond.

From the price-lists of various opticians for 1877–78 we extract the following items, which may be of interest: Merz, of Munich—objectives of 5, 6, 7, 8, 9, 10, 12, 14, 16, 18 French inches aperture, at 800, 1440, 2100, 3200, 4400, 6000, 9000, 13,500, 19,000, 27,000 German marks (101 marks = 100 English shillings); these are unmounted. An 18-inch objective completely mounted, 105,000 marks; a 9-inch, 35,000; a 6-inch, 11,000; heliometers, 6 inches aperture, 35,000 marks; comet-seeker of 43 lines aperture, equatorially mounted, complete, field of 5°, 2400 marks, etc., etc. Meyerstein, of Göttingen—transit circle, one divided circle, four microscopes, objective 4 (French) inches aperture, complete, 12,480 marks; vertical circle, objective 4 inches, complete, 9750 marks; transit instrument, objective 4 inches, 6050 marks; equatorial, complete, objective 4 inches, 9750 marks; comet-seeker, objective 43 lines, 1560 marks. Breithaupt and Son, in Cassel—portable meridian circle, complete, objective 2 inches, 2700 marks; sextants reading to 10″, from 285 marks down.

In *Physics*, Bottomley has presented to the British Association the preliminary report of the committee for commencing secular experiments on the elasticity of wires. The arrangements for suspending the wires are now complete. An iron tube 60 feet long, 9 inches wide, and 4½ inches deep, in six-feet sections, has been erected in the tower of the University of Glasgow, and has been firmly attached to the wall. The wires are to be hung from a heavy plate of gun-metal at the top, supported independently of the tube. This plate will carry additional wires with comparison marks, so that the measurements may be made independent of the yielding of the point of support. A window of plate-glass at the bottom of the tube allows the wires to be seen. The measurements are to be made by means of a cathetometer supported on a strong gun-metal table attached by brackets to the wall of the room. Experiments for testing the apparatus are now in progress.

Becker has discussed the correction necessary in weighing in air, for the weight of the air displaced by the body weighed and also by the weights employed. By taking the specific gravities of the weights as the ordinates, and the necessary corrections as abscissas, and plotting the curve, it gives an equilateral hyperbola referred to asymptotic axes. Hence for high specific gravities such as platinum the correction is small, while for low ones which are not far from unity the correction is comparatively large, and increases with great rapidity as the specific gravity sinks. He concludes that for specific gravities above one, no quantity less than twenty-five milligrams requires correction, while for specific gravities above three, nothing less than one decigram requires to be corrected. A table giving the vacuum correction for substances having a specific gravity between 0.985 and 27.738, the weights used being of brass, the error being less than one-thirtieth of a milligram, and a second similar

table for platinum weights, between 0.950 and 51.766, are given in the memoir.

Höfler has described a simple and easily constructed form of apparatus for demonstrating the various results obtained by the superposing of waves. Upon the face of an upright board, which may be fastened to any convenient board at right angles to it to serve as a base, two parallel strips of wood are fastened lengthwise, through which small holes are drilled opposite one another, for the passage of wires carrying small white balls on their ends. By inverting the apparatus, and allowing the balls to fall against the edge of a strip of wood cut into a convenient series of sinusoidal waves, the other ends of the wires may be cut to a length parallel to the lower strip on the face of the board. On inverting the apparatus the wires are allowed to fall so that their lower ends rest upon the edge of a straight strip. Their upper ends form then the sine curve mentioned. By placing below these wires the same curve half a wave length displaced, complete interference will result when the wires fall, and the balls will form a straight line. If they be allowed to fall on a curve of twice the wave length, a compound wave results, which shows the form of sound wave corresponding to a note and its lower octave. Other and similar experiments with this apparatus are described.

Ridout has communicated to *Nature* the results of a series of experiments undertaken in order to ascertain whether columns of fluid which are affected by sound have a peculiar structure, and if so, what that structure is. When a fluid escapes from a contracted opening it may form a column of the same shape as the opening, or it may form an expansion after leaving the opening. The column in the first case is called prismatic, and in the second segmental. Segmental columns are sensitive to sound pulses, prismatic columns are not. By means of two jets of glass placed in the same plane, and inclined to each other at an angle variable at pleasure, every variety of segmentation was obtained. The author hence infers that a segmental jet really consists of two jets meeting at an angle. Various ingenious experiments are described with such segmental jets of common gas, from which the author concludes (1) that a fluid column sensitive to sound consists of two columns meeting at an angle; (2) that the resultant of the two columns is an expansion; (3) that a column so constituted will under favorable conditions emit a note; (4) that if excited by an external sound it takes the same form as when it spontaneously emits the sound; (5) that a column excited as in (3) and (4) sends out an expansion at an angle (usually a right angle) to the primary expansion; (6) that the component columns of a sensitive column must be at such unequal distances from the sounding body that they are not thrown into the same phase of vibration; (7) that a gaseous column increases in sensitiveness with the pressure, *i. e.*, the velocity; (8) that a gaseous column is lessened in velocity by ignition at its origin; and hence (9) that a gaseous column when ignited is less sensitive than when unignited.

Mouchot has made a series of experiments in Paris, continued through the time of the Exhibition, on the industrial utilization of solar heat. In one experiment, made on the 2d of September, he used a solar mirror having an aperture of about twenty square meters, connected with its receiver. At the focus of this mirror an iron boiler was placed, weighing with its accessories 200 kilograms, and having a capacity of 100 liters, 70 for the liquid and 30 for the steam-chamber. In half an hour the 70 liters were raised to boiling, and soon afterward the manometer indicated a pressure of 5 atmospheres. On the 22d of September, the sun being slightly veiled, he obtained 6.2 atmospheres; and worked, under a pressure of 3 atmospheres, a Tangye pump, raising 1500 to 1800 liters of water per hour to a height of two meters. On the 29th, with a clear sky, a pressure of 7 atmospheres was obtained.

Rosetti, from a series of thermo-electric measurements, has been led to express the relation between the absolute temperature of a body and the thermo-electric current produced by its radiation, in the form of a rather simple equation. To test the formula the radiation from a hot copper ball was used for temperatures below 800°; from three copper disks placed in the same region of the flame, from iron and platinum disks, and from a small cylinder of magnesium oxychloride placed in the oxyhydrogen flame, for temperatures higher than this. Finding the formula to agree with experiment, he has extended it to determine the sun's temperature, and has found, by a modification of his method, the effective value of this constant to be 9965.4° C.

Joubert has presented to the French Academy a paper on the rotatory power of quartz, and on the variation of its value with the temperature. The angular coefficient of the curve of variation increases at first pretty regularly up to 300°. From this to 840° it is nearly constant, and the curve is nearly a straight line with a point of inflection about 500°. Beyond 840°, and up to 1500°, the rotatory power increases with extreme slowness. With a quartz of 46.172 millimeters, giving a rotation of 1000° at 0°, the increase from 300° to 900° is 12 minutes per degree. With a quartz of only 11 millimeters the increase would still be 3 minutes per degree. Thus quartz makes an extremely sensitive thermometer, with the essential condition of comparability.

Mayer has discussed the morphological laws of the configurations formed by magnets floating vertically and subjected to the attraction of a superposed magnet. The paper is illustrated by diagrams made by pressing a piece of paper down upon the vertical ends of the needles tipped with printer's ink after the configuration had been formed. Around the dots thus obtained circles were drawn and connecting lines, so as to make the outline more evident. From two to twenty needles were used. He calls attention to many of these forms as illustrating molecular structure, in the cases of unstable equilibrium, expansion on solidification, and allotropy and isomerism. He also describes other methods of obtaining the configurations, and figures an apparatus for projecting the phenomena.

Ayrton and Perry have published a preliminary paper on their determination of the ratio of the electromagnetic to the electrostatic unit of measure. The method which they employed was very simple in principle, but presented unusual difficulties in practice. It consisted in measuring the capacity of an air-condenser in two ways: first, electromagnetically, by the swing of the needle of a ballistic galvanometer; and second, electrostatically, by a measurement of the linear dimen-

sions of the condenser. The ratio given by three measurements on three successive days was 29.74, 29.95, and 29.72 ohms, the greatest difference between any one of these daily means and the final mean being only about one-half per cent. The final mean, 298.0 million meters per second (representing the mean of 98 discharges of the air-condenser), the authors think may be regarded as correct to one per cent., and is identical with the value of the velocity of light obtained by Foucault. The details of the apparatus and of the experiments will be published later.

In *Chemistry*, Davy and Cameron have shown that when ammonium selenate is exposed to heat, it first resolves itself into ammonia and an acid ammonium selenate hitherto unknown, and then, at a higher temperature, that this salt breaks up into water, selenium, selenous oxide, and nitrogen, thus showing that in the first stage some analogy exists to ammonium sulphate, but that this analogy disappears entirely in the second stage.

Wanklyn and Cooper have proposed a direct method of determining the calorific power—which is the available energy—of alimentary substances, based upon the fact that the amount of oxygen consumed by an organic substance is a measure of its heat-producing force. Their method is that of Forchhammer, by oxidizing with a standard solution of potassium permanganate. But in place of simply mixing this with the solution to be examined, this latter solution is distilled with the permanganate in excess. During the distillation it is advisable to have the liquid strongly alkaline, but the authors make it acid before the residual permanganate is titered.

Long has made a series of experiments on the decomposition of steam by ignited charcoal for the production of water-gas. In his earlier experiments the results were complicated by the evolution of absorbed gases from the charcoal. When this source of error was allowed for, it was observed that no fixed relation existed between the carbonous oxide and the carbon dioxide present. But the author noticed that the carbonous oxide was directly as the amount of charcoal present in the tube. Hence it is evident that hydrogen and carbon dioxide are at first formed, and then that the latter gas is reduced by the excess of ignited carbon. If, however, there be an excess of steam present, this is reduced, and carbon dioxide again formed.

Musculus and Gruber have given, in a paper upon starch, their reasons for believing that the constitution of this substance is much more complicated than is generally supposed. They find that on treating starch with diastase or a dilute acid, it splits into maltose and soluble starch, and that this latter substance by similar treatment yields maltose and α-achroödextrin, which in its turn yields maltose and β-achroödextrin, and this again maltose and γ-achroödextrin. This latter body yields solely maltose, which, by continuing the process, splits into dextrose. The special and distinguishing properties of each of these bodies are given in the paper.

Peckham has investigated the cause of the explosion of the flour mills in Minneapolis in May last, and gives it as his opinion that the explosion was due to the ignition of the fine dust of flour, with which the mill was filled, by sparks coming from millstones which had been allowed to run dry. In the dust-house connected with these stones several hundred pounds of dust a day settled under ordinary circumstances.

Anthropology.—In the eleventh annual report of the Peabody Museum, Professor F. W. Putnam figures and describes an earth-work on the Lindsey estate, near Greenwood Seminary, Lebanon, Tennessee, which embraces all the accessories of a settlement of the ancient mound-builders. First of all, on an eminence in the bend of the creek, is an earth-work inclosing an area of between ten and eleven acres. At regular distances along the embankment, on the inside, are slight elevations at the angles of the work. The ditch and bank are very elaborate, and indicate great care and forethought in the execution. Within the inclosure are several varieties of mounds. One of them is a large tumulus 15 feet high and 138 by 120 feet at the base, and contained no human remains. Professor Putnam regards this as the site of an important building. There are other mounds which were filled with stone graves, all containing the bodies of adults. "Scattered irregularly within the inclosure are nearly one hundred more or less defined circular ridges, the remains of the dwellings of the people who had erected the large mound, made the earthen embankment, buried their dead in the stone graves, and lived in this fortified town. On removing the hardened and burned earth forming the floors of the house, small stone graves were found in eleven of the nineteen circles examined, containing the bones of children. These little graves were found at one side of the centre of the house, and a fire had been kindled over the spot. Very many beautiful specimens of pottery were exhumed."

At the Nashville meeting of the American Association, Colonel Garrich Mallery, of the army, detailed to do ethnological work on Major Powell's survey, read a paper with the title, "Are the Indians dying out?" The author takes the ground that the former population of the country was not so great as has been represented, and that, on the whole, the aborigines are not melting away before the civilization of the Anglo-Saxon. The paper was freely discussed at the time by our home journals, but since the volume has appeared, considerable attention has been given to it abroad. Professor Daniel Wilson, of Toronto, called attention to it in the anthropological department of the British Association, and the Royal Society of London devoted one of its sessions to its discussion. The London *Times* of August 31 and the weekly edition of September 6 both refer to the paper, and the question is very properly raised whether the policy of the government in treating its savage dependencies should not be newly organized with a view to this fact. No doubt in our own country the opinion that the Indian is doomed to extinction has soothed the consciences of many who have helped him on to his supposed destination.

The second number of the *American Antiquarian*, edited by the Rev. Stephen D. Peet, contains the following papers: "A Comparison of the Pueblo Pottery with Egyptian and Greek Ceramics," by Edwin A. Barber; "Traditions of the Deluge among the Tribes of the Northwest," by the Rev. M. Eells; "Description of an Engraved Stone," by John E. Sylvester, M.D.; "Prehistoric Ruins in Missouri," from the *Western Review*; "Gleanings," by S. S. Haldeman; "Sketch of the Klamath Lan-

guage," by Albert S. Gatschet; "The Location of the Indian Tribes of the Northwest Territory," by Stephen D. Peet; "Remarkable Relics: Leaf-shaped Implements," by Professor M. C. Reid; "Perforated Tablets," by R. S. Robertson. The articles of permanent value are those by Mr. Gatschet and Rev. Mr. Peet, bringing together materials for an exhaustive work on North American Indian synonymy now in preparation at Major Powell's office in Washington.

The October number of the *Revue d'Anthropologie*, of Paris, contains a paper by Señor Estasnilas Ceballos on a prehistoric tumulus in Buenos Ayres. As one reads the description he is struck with the similarity to those of our own country. The most interesting part of the journal is that devoted to the reports upon the anthropological exhibition in the Trocadéro Palace, in connection with the Exposition. It is quite certain that never before was there collected so vast and such rich material for the study of the natural history of man, and from the distinguished names on the committees we are sure that the opportunity will not go unheeded.

Editor's Historical Record.

POLITICAL.

OUR Record is closed on the 25th of November. —Elections were held in thirty-one States on the 5th of November. Representatives in the Forty-sixth Congress were elected, and, in twelve of the States, Governors. New Hampshire, Massachusetts, Michigan, Nebraska, Pennsylvania, Kansas, and Nevada elected Republican Governors, while the Democratic candidates for that office were chosen in Delaware, South Carolina, Tennessee, and Texas. In Connecticut, the election of Governor is to be determined by the Legislature of that State. In New York, the Republican candidate for Judge of the Court of Appeals was chosen by a plurality of 30,000, and the next Assembly will stand 98 Republicans, 28 Democrats, and 2 Greenbackers. In New York city, Edward Cooper, the Anti-Tammany candidate for Mayor, was elected by a majority of nearly 20,000. In Massachusetts, General Butler was defeated, the Republican candidate receiving a plurality over him of about 26,000. In Pennsylvania, the Republican candidate for Governor received a plurality over the Democratic candidate of 23,349. The newly elected Legislatures of Illinois and New Jersey have Republican majorities.

The Forty-sixth Congress will consist of 134 Republicans, 148 Democrats, and 11 Greenbackers.

General Gordon was re-elected to the United States Senate, November 19, by the Legislature of Georgia.

The payment of the award of the Halifax Fisheries Commission—$5,500,000—to the British government was made by the American minister in London, November 23, accompanied by a communication protesting against the payment being understood as an acquiescence in the result of the Commission "as furnishing any just measure of the value of a participation by our citizens in the inshore fisheries of the British Provinces."

The British troops, on the morning of November 21, no reply having been received from the Ameer, crossed the border, and invaded Afghanistan in three columns.

A proclamation of the Viceroy of India recounts the history of the relations between India and Afghanistan during the last ten years. It says: "In return for the kindness of our actions and intentions, as witnessed by the Ameer's reception at Umballa, by the material aid afforded to him from time to time, and by the free commerce with India accorded to the Afghans, we gained only ill-will and discourtesy. The Ameer openly and assiduously attempted, by words and deeds, to stir up religious hatred and bring about a war upon the British empire in India, and although he had repelled all efforts for amicable intercourse by the Indian government, he formally received a Russian embassy; and finally, while the Russian mission was still at Cabool, he forcibly repulsed the English envoy, whose coming had been duly notified to him, and met our attempts to promote friendly relations with open indignity and defiance."

The Russian Czar, through General Kaufmann, has presented the Ameer of Cabool with a costly sword. The blade of the sword has the following inscription in the Persian tongue: "May God give thee victory over the infidels."

An attempt was made to assassinate King Alfonso of Spain as he was driving through a street in Madrid, October 25. The pistol-shot failed of its mark, and the assassin was seized. A similar attempt was made against King Humbert of Italy on the occasion of his reception in Naples, November 17. A cook rushed at the young king with a dagger, but succeeded in inflicting no serious wound.

The results of the recent election of municipal delegates in 17,000 communes of France indicate that the Republicans will gain a majority in the Senate.

DISASTERS.

November 9.—Destructive fire at Cape May, New Jersey. Eleven hotels and thirty cottages burned.

November 21.—Fourteen men killed and many injured by an explosion in a coal mine at Sullivan, Indiana.

October 31.—The National Company's steamer *Helvetia*, from Liverpool to New York, ran down and sank the British coast-guard cruiser *Fanny*. Seventeen lives lost.

OBITUARY.

October 28.—In San Francisco, California, Colonel Richard Realf, poet, aged forty-four years.

October 24.—Cardinal Paul Cullen, Roman Catholic Archbishop of Dublin, in his seventy-sixth year.

October 27.—In Paris, France, Christopher R. Robert, founder of Robert College, Constantinople, aged seventy-seven years.

November 1.—In Paris, France, L. A. Garnier-Pages, the statesman and historian, in his seventy-sixth year.

Editor's Drawer.

FOR the following amusing anecdote of General Grant we are indebted to one of the cleverest journalists of New Jersey:

The "belted Sphinx" has spoken, and the American journalist raises the doubt whether the interviews said to have been held with ex-President Grant in Europe were *bona fide*. Could he talk as well, with such systematic logic, as the reporters accredit him? He has been known only as the Silent Man. Now he blossoms out in lively conversation. Of the Presidents I have known, I recollect a scowl from Buchanan; a terse inquiry from Lincoln which challenged my cheek, and an answer which won his warm approval; a tumbling embrace while in the act of shaking hands with Andrew Johnson in a palace-car, which rolled us both into a corner together; and one talk with General Grant. I had seen him before in the stiff way every body knew.

In the campaign of 1876 I was escorted to a garden piazza where he sat smoking. A band came up to the front of the house and played "Hail to the Chief." Secretary Robeson said: "General, there is the old tune. Tell the doctor." The Secretary disappeared; the President began. He said (and I give his story as nearly verbatim as may be, sitting quietly and giving an occasional puff of my cigar in approval):

"When I went on to Gilmore's Jubilee in Boston, I was not at all surprised to find one of Jim Fisk's boats at my disposal up the Sound, and a band of music on the upper deck playing 'Hail to the Chief.' It was the old tune, and none other would have been appropriate. I had listened to it so many years; but they kept on. I had a cabin recognition of entrance with 'Hail to the Chief,' and they played it at supper. When I went to my state-room they played occasionally other things, but 'Hail to the Chief' came in as a regular interlude. I was wild with it, but it lasted all the early night, until I got to Norwich, and leaving the boat, heard the last of 'Hail to the Chief'—as I thought. In the Boston car, however, was another band, and that gave me 'Hail to the Chief' all the way to Worcester, and into Boston, where the whole militia of the State was to be passed in review.

"What splendid troops! But each regiment had a brass-band, and each band played 'Hail to the Chief.' I rode down the review, went to the hotel, took the balcony, and the whole passed me, each band playing 'Hail to the Chief.' Then I had breakfast, a band in the room playing 'Hail to the Chief.' After that I went to the Gilmore Coliseum, where I was received with a thousand voices, as many instruments, anvils included, with 'Hail to the Chief.' The racket was terrible. I got back to the hotel, but all the evening those same regiments passed under my windows playing 'Hail to the Chief.'

"It was about 11 P.M. that I was waited on by a delegation from Worcester. They wanted me to take an early train and review the school-children and the Sunday-schools of Worcester the next morning, and as I was thoroughly convinced that all the brass-bands and all the 'Hail to the Chief' of Massachusetts were concentrated in Boston, I decided to go to Worcester at 6 A.M. Flank it, I thought I would.

"They had a band in the car at the dépôt, and that played 'Hail to the Chief,' and kept it up. At Worcester there was never a more beautiful sight—some six thousand children in national colors, representing all the schools in the city, and every school had a brass-band playing 'Hail to the Chief.' When I took the train from Worcester to Springfield there was another 'Hail to the Chief,' and it lasted all the way to Springfield. There no one expected me; I was put into a common passenger car, and slept solidly all the way down the road, getting quietly to New York."

That was Grant's story, told cheerily and with a full sense of its constant iteration and reiteration. The Secretary appeared upon the garden steps again, the great general and President dismissed his solitary auditor, and the band in front struck up anew "Hail to the Chief." So much spoke the Silent Man. After that experience who shall say that he "hath no music in his soul?"

AN inquisitive reporter of the Paris *Figaro*, in interrogating M. Roch, the intelligent headsman who guillotined Barré and Lébiez, asked, "Where do you dine habitually?"

"Sometimes here, and sometimes there," replied the executioner; "I don't much care where it is, so long as it's at a restaurant *at so much a head*."

How will this poesy do, on a lady's choice of a husband?

> Maria, just at twenty, swore
> That no man less than six feet four
> Should be her chosen one;
> At thirty she is glad to fix
> A spouse exactly four feet six
> As better far than none.

IN the Drawer for September last we gave an extract from a mathematical journal that was rather amusing. Below will be found an extract from a circular distributed at the American Institute Fair recently held in this city, in which the advantages of the "Improved Noiseless Rails" are succinctly set forth:

> The Wire filled Rails have the advantage on raised ground, where the Rail Road going up, have no difficulty, on account the crevices in the Wire are filled with Sand and Dust by nature on account to be exposed, if the Wheels are Dove-tailed the same way, like the Rails, combined together, they will make no noise at all.

The elevated-road people should bore into this.

THE Rev. Dr. ——, for the sake of being near his aged parents, accepted a small rural parish in Vermont, and, if the truth were confessed, with a somewhat distinct feeling that his new parishioners were to bask in such privileges as only a very odd turn in the wheel could have brought within their reach.

On the evening of his first prayer-meeting he settled his rather imposing form in the desk, and watched his assembling audience with some careful thought as to how he was to bring his eloquence down to a measure they could receive; and then for one moment the question flashed across him, What if he were to stay with these people all his life? But a superior smile waved it instantly aside—not that he liked to put the

thing exactly so to himself; but then—of course—would you keep a whole sun shining for one little corner all day long?

As the service went on, Deacon B——, the unshakable pillar of the little church, was called upon to pray. The good deacon had a few set phrases that invariably lent wings to the bone and marrow of his prayers; but to-night, with a confusing sense of the new listener in the desk, they seemed to get used up before enough had been said. He must pray for the new minister, of course, and hurrying along, he stumbled upon one more "phrase," usually kept for his own benefit at home: "We give thanks for all Thy foregone mercies in his behalf, and pray that his *poor, weak, and unprofitable life* may still be spared."

Apropos of the casuistry of kissing, this bit of verse comes from London:

When Sarah Jane, the moral miss,
Declares 'tis very wrong to kiss,
I'll bet a shilling I see through it:
The damsel, fairly understood,
Feels just as any Christian should—
She'd rather *suffer* wrong than *do* it.

A grotesque and very Western idea of the scope and object of American editorial life is furnished by a San Francisco newspaper man, who says:

"A young gent, who is at least sufficiently educated to write on one side of his paper only, sends us a long essay on 'The True Aim of Journalism.' We haven't read the article, but suppose the author, like almost every one else, prefers the navy size, No. 44 calibre, to any other pistol. In this locality especially is the aim of the journalist of the greatest importance, and the man whose hand shakes, and who can't hit an outraged community's third vest button three times out of five, has no business trying to run a paper in California."

Two bright lights in the Southern General Assembly met one day, one of whom, Brother Fuller, rather prided himself on the keen blade of his wit, while the other carried as gracefully as he might the somewhat too suggestive name of Crane.

"Brother Crane," began his friend, with a sudden gleam in his eyes as he felt his genius stir wickedly within him—"Brother Crane, can you tell me the difference between a *crane* and a *buzzard?*"

Brother Crane turned, fixed his eye on his assailant, and measured his ample proportions slowly from head to foot.

"Yes," he replied, quietly, "I can. The buzzard is *Fuller* in the head, *Fuller* in the breast, and *Fuller* all over."

For some reason or other Brother Fuller's business seemed to keep him on the opposite side of the room for the remainder of the day.

A poor old soul in N——, Massachusetts, who had seen better days in the past, but whose present and future stood in the same rather rayless gloom, drew frequent consolation from visiting a more fortunate friend and calling sympathy to the contemplation of her various woes, especially of her health, which was sure to be "mis'able."

But at last it happened, one winter's day, that, in reply to the usual inquiry, "How do you do to-day, Mrs. K——?" she searched her conscientious soul in vain for some complaint to make. She could not go beyond the truth, but neither ache nor pain could be discovered; and yet what was to become of her comfort if there were nothing to bewail?

At last, from between the horns of her dilemma, she answered, with hesitation and reluctance in her tone, "Well, I'm—pretty well *now*, but—I *don't expect to be, come next summer.*"

Professor S——, whose loss is deeply lamented in the scholastic circles of New York, was at one time a highly valued contributor to the journal of which he afterward took charge, and being one day introduced to its editor, was greeted with every expression of cordiality and respect. It was a great pleasure to meet one whose learning and services had been, etc., etc. "But, professor," added the editor, turning upon him and seizing his hand with sudden earnestness, and with solemnity in his face, "I *hope* you *pray for my printers!*"

The professor replied that he was very happy to offer his prayers in behalf of any who were in need of them; but what was the special urgency in this case?

"Ah!" answered the editor, shaking his head impressively, "*if you could but hear them swear when they get to work on your manuscript!*"

Out in Colorado, at the foot of a perpendicular cliff which towers to a vast height, is a lonely grave, covered by a huge bowlder bearing the following inscription:

An unknown man lies buried here,
Whose name was probably Davidge
(From papers found about his clothes),
Slain by the lordly savage.
We found him by his broken gun,
His hands gripped round the stock yet,
A good big lead mine in his head,
But no gold in his pocket—
Only a well-thumbed deck of cards,
All blackened on their faces,
With kings and queens in duplicate,
And thirteen extra aces.

A friend of the Drawer was a sojourner in Ireland during the past summer, and of course visited the Lakes of Killarney. He set out for the Gap of Dunloe, which is a wild mountain pass, intending to walk through it to the upper lake, which is the usual mode of approach for the tourist. While thus proceeding, the little hut or cabin occupied by a descendant of the far-famed Kate Kearney, that dangerous beauty of long ago, and situate at the base of a mountain, was passed. As our friend approached it, the guide—a genuine specimen of that race which springs green and vigorous from the "first flower of the earth and first gem of the sea"—began his legends about the locality:

"Do ye see that mountain?" said he, "behind the cabin there?—I mane Kate Kearney's descindant's cabin. Well, it's no less nor two thousand five hundred feet high, and it is well known that whin Kate Kearney from the top of it unloosed her hair, it touched the base there fornint ye."

"Is it possible?" said our friend.

"Indade, thin, it is, Sir; but shure I see that you're from America, and as for stories it's not worth while to be tellin' thim to one of your peo-

ple. Didn't I come wid some gintlemin from the States to this place a short time ago, and the divil such stories I ever heard in my life as they gave me. I wondher if they could be thrue? And wondhering I have been, ever since I heard thim, what wondherful places and things ye must have there! I wondher if the stories were thrue?" again said the guide, as if carried to the depths of doubt and reflection.

"What are the stories?" said our friend.

"Shure," said the guide, "I couldn't be tellin' all the stories in a short ride like this; but one of thim has struck my heart and soul, and I'll niver forget it—niver, niver! I wondher if it can be thrue!"

"Well, let us hear it," said our friend, "and we will decide."

"Well," said the guide, "afther I told them some of my tales, shure they began to give me back the wondhers, and one of thim—a very dacent-lookin' man he was, and not given, I should think, to coortin' the divil by lyin'—began to tell of the splindid hotels yez have in America, and—I'll niver forget it—told me that there was one in New York called the Fifth Avenue Hotel, and that it was *three miles and a half long;* not only that, Sir, but that *the waithers rode round on ponies sarvin' the guests!* I wondher if that was thrue!"

A CLERICAL friend says that one evening he was called upon, during his pastorate in California, by an evidently Irish couple, who desired him to marry them. He inquired rather suspiciously why they had not gone to the priest, judging rightly that they were Roman Catholics; and suspecting, as they were pretty well advanced in years, that it might be a case of a divorced man or woman—for he was not satisfied with their explanation that the priest would not tie the knot because it was Passion-week—he put the question abruptly to the man: "Have you ever been married?"

"No, Sir," was the ready answer.

"Have you?" he appealed to the woman.

She replied, with perfect humility: "I never had the chance, Sir."

It was irresistible, and he married them immediately.

DR. GRAHAM having passed a very creditable examination before the Army Medical Board, was commissioned an assistant surgeon in the United States army in 18—, and ordered to report for duty to the commanding officer at Fort M'Kavett, Texas. There were no railroads in the Western country at that time, and the usual way of getting to Texas was by the Mississippi River to New Orleans, and then crossing the Gulf to stage it up through the State. Dr. Graham was very desirous of examining the Western country mineralogically, so applied and received permission from the War Department to go by way of Arkansas and the Indian Territory to his post.

On his arrival at St. Louis he shipped the greater part of his baggage by way of the river, and taking only what he could carry on horseback, started on his journey. While in St. Louis, at the Planters' Hotel, he formed the acquaintance of a gentleman who, learning where he was going, gave him a letter of introduction to his brother, who was a farmer living on his route in Arkansas. It is not necessary for us to follow him on his road, or tell what discoveries he made in the interest of science; sufficient it is that one day, toward dusk, he reached the house of the gentleman to whom he had the letter, and dismounting, knocked at the door and presented his letter to the judge (even in those days every one was a judge in Arkansas), who would not have needed it to have accorded him an open-handed welcome; for travellers were a godsend, and news was as much sought after then as now. After a short visit, he proposed to go on to the next town, about four miles off, where he intended to put up for the night. The judge would not listen to his leaving, and was so cordial in his desire for him to stay that he would have been rude not to have done so. The judge, after directing one of the servants to attend to his horse, invited him into the dining-room, where he was introduced to the wife and daughter of his host, and also to a substantial Western supper, to which he did ample justice.

After supper they adjourned to the parlor, and he entertained his new-made friends with the latest news from the outside world. The judge brewed some stiff whiskey punch, which Graham, socially inclined, imbibed quite freely. The old couple retired, and left their daughter to entertain him; and whether it was the punch, or what, at all events he made hot love to her, and finally asked her to be his wife and go to Texas with him, to which she consented. She being very unsophisticated and innocent, took every thing he said in downright earnest, and with her it was a case of "love at first sight."

But I am anticipating. During the night our friend the doctor woke up and remembered what he had said, and it worried him; but he said to himself, after emptying his water pitcher, "Never mind, I'll make it all right in the morning. I must have made a fool of myself. She's lovely, but what must she not think of me!" and rolled over and went to sleep again. Morning came, and upon his going down to the parlor he found the young lady alone, for which he blessed his lucky stars, and was just about to make an apology, when she said:

"I told mamma, and she said it was all right," at the same time giving him a kiss which nearly took his breath away. "Papa is going to town this morning, dear, and you ride in with him and talk it over; but he won't object, I know."

"But, my dear miss, I was very foolish, and—"

"No, indeed; you were all right."

"Well, I will go to my post, and return for you, for I must go on at once."

"No; I can go with you."

"You won't have time."

"Oh yes, I will. Papa will fix that. It would be such an expense for you to come back all the way here."

"But I have no way of taking you."

"I have thought of that; that does not make any difference. Father will give us a team."

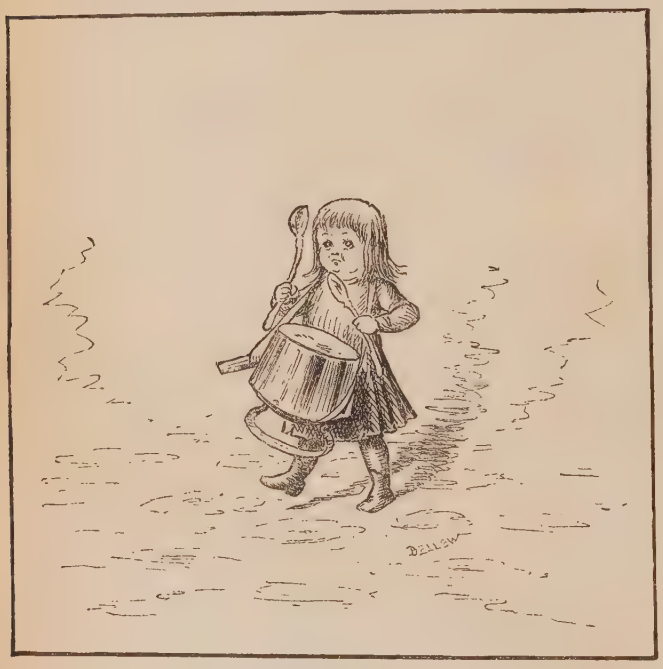
With nearly tears in his eyes he went in to breakfast, to which at that moment they were both summoned; but, alas! appetite he had none. It was not that she was not pretty and nice; but he thought what a confounded fool she must be not to see that he wanted to get out of it. But it was no use. When the judge started for town, Dr. Graham was sitting beside him. The judge

saved him the trouble of broaching the subject by starting it himself:

"I always, young man, give Nell her own way; so it is all right; you need not say a word."

"But I've got to go on to-day."

The old judge turned his eyes toward him. He had an Arkansas bowie in each, and one of those double-barrel shot-gun looks as he said, "You ain't a-trying to get out of it, are you?"



The doctor, taking in the situation, said, promptly, all hope being gone, "No, Sir."

"That's right. I will fix every thing for you: give you that black team of mine, and a light wagon to carry your wife's things" (here the doctor shuddered), "and a thousand as a starter. You can be married to-night, and leave early in the morning. That 'll suit, won't it?"

"Yes, Sir," answered Graham, faintly. But on the judge turning toward him, he said, "Yes, Sir; certainly."

"After you get fixed at your post I will come down and pay you a visit. I have been thinking about selling out and moving to Texas for some time; it's getting crowded here, and things are a-moving as slow as 'lasses in winter-time."

Things were arranged as the old judge said. The marriage took place, and the army received an addition to its ladies in the person of the Arkansas judge's daughter, and Dr. Graham has never regretted the obduracy of his father-in-law or the unsophisticatedness of his wife.

A KETTLE-DRUM.

A FRIEND from Oberlin tells this anecdote of President Finney:

It was one of his ways, as he was absent-minded, to ask every one he met and spoke to—for he knew every one—for his or her name. He was in the habit of taking a daily walk, in which he regularly met a young man, whom he regularly saluted with, "Good-morning. I've met you before, I am sure. What is your name, now?"

The young man, weary of making daily reply, one morning responded with a new name: "Tom Nokes, Sir."

The president stopped short, surprised by the unfamiliar name, and fastening his eyes on the accustomed face, exclaimed, brusquely, "*John Steele, how you do lie!*"

It is presumed that he never was puzzled for the right name afterward.

MANY years ago, in the days of the old State banking system, there lived in one of the large towns in Western New York an eccentric tavern-keeper named Gumble. He had "a grudge" against the local bank, and to avenge himself, he quietly bought up a thousand dollars of its bills, and swooped down unexpectedly upon the concern with a demand for specie. The bank president heard the demand with provoking complacency, and began at once to count out the required coin. While thus engaged he greatly excited the wrath of Gumble by inquiries for his health and the health of his family. To these repeated inquiries Gumble replied only, "*Onus bonus ad separandum*, Sir." Presently the whole thousand dollars had been redeemed, and Gumble, with his basket of coin on his arm, went away, flinging back at the bewildered banker as he left, the mysterious "*Onus bonus ad separandum*, Sir."

A crowd of curious loungers awaited Gumble's return to the tavern "stoop," and as he approached, a member of the party said, "We see you have got the specie. What did you say to the president?"

"I said, '*Onus bonus ad separandum*, Sir.'"

"Well, what did *he* say?"

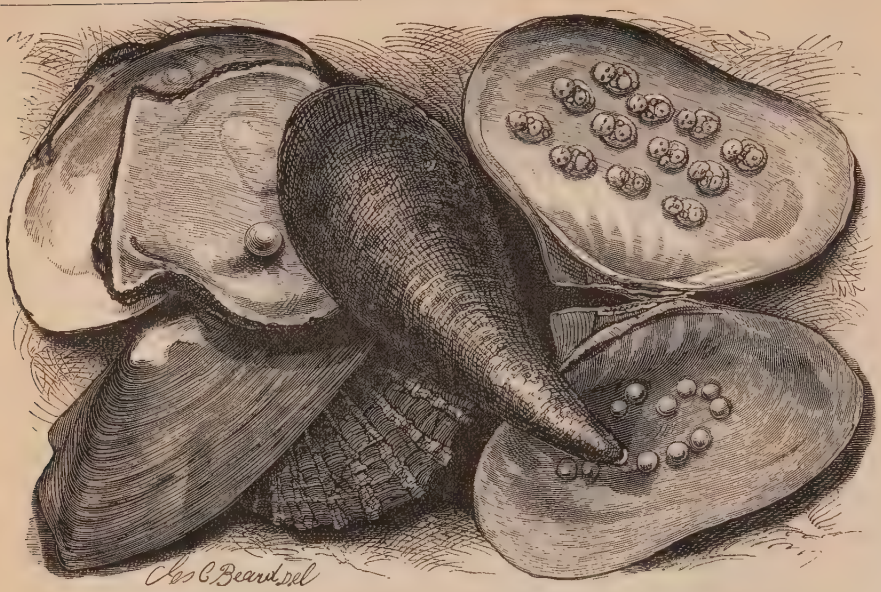
"He could say nothing: *he felt the want of an education*, Sir."

A RAILROAD official in Ohio sends the following:

We have just concluded a fair and racing of horses. Two gentlemen were discoursing the mode of pool-selling for races, and the authority for using the word among railroad and racing men. A third gentleman joining in the discussion remarked that he had the best authority for it, viz., that the pool of Siloam was made for the Jewish race, and the fullness of the Gentile is now coming in to win.

HARPER'S NEW MONTHLY MAGAZINE.

No. CCCXLV.—FEBRUARY, 1879.—Vol. LVIII.



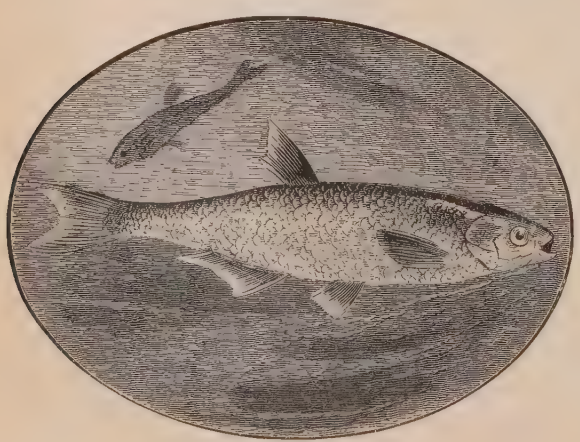
CLEOPATRA DISSOLVING THE PEARL.

TREASURES OF THE DEEP.

"In good sooth,
If this the manner giveth not content,
Then may the matter, like the famous cup
Wherein old Egypt's queen resolved a pearl,
The ransom of a kingdom at a draught,
Contain some stuff of value."—Old Play.

INDIA seems to have been the original source from which pearls were obtained, and its people seem also to have possessed a more accurate knowledge of their nature than the rest of the ancient world. In the old Indian fable in which the elements are commanded to contribute their choicest treasures to form a gift-offering worthy of the last and greatest æon or incarnation of the deity, the air or firmament brings the rainbow, the earth furnishes the ruby, the fire a meteor, and the sea offers a pearl. The rainbow forms a halo around the god, the ruby blazes on his sacred forehead, the meteor serves him for a lamp or cresset, but the pearl is worn upon his heart. "Forsomuch," proceeds the ancient and forgotten poet in his beautiful symbolism, "as the pearl is a product of life, which life from an inward trouble and sorrow and from a fault produces purity and perfection, it is pre-

Entered according to Act of Congress, in the year 1879, by Harper and Brothers, in the Office of the Librarian of Congress, at Washington.



PEARL-BEARING SHELLS.

ferred, for in nothing does God so much delight Himself as in the tenderness and lustre of virtue born of trouble and repentance."

There is, indeed, in "the tenderness and lustre" of the pearl, and the fact that it is "a product of life," a suggestiveness and character which render it available to sacred writers of all religions.

There is but one pearl, a gem worthy of the name, the true Oriental pearl, which possesses the peculiar diaphanous lustre technically called "water," though many shells produce so-called pearls, some of them of considerable value. The shell which produces the translucent pearl is thick, and of an imperfect oval or nearly circular shape, as seen in the accompanying illustration with its adherent pearl. It is sometimes quite large, from eight to ten inches in diameter, though commonly about four. The outside of the shell is rough and variegated in structure. A glimpse of it sufficient to give an idea of this may be had, as it lies partly beneath the others in the foreground. The body of the oyster is unfit for food—an illustration of the universality of the law of compensation—but the shell itself, in addition to "bearing its royal gift of pearls," furnishes the valuable nacre, or mother-of-pearl, so largely used in the arts. The history of this gem has already been so fully and ably treated in this Magazine, to which we respectfully refer the reader, that we pass on to the pinna, or wing-shell, which is seen in the illustration overlapping the *Meleagrina margaritifera*, or pearl-oyster shell, that produces beautiful pink accretions of nacre, and which happen now to be very fashionable as gems. One most remarkable circumstance connected with this shell is that it actually produces silk, from which gloves and other articles of a fine texture, silken lustre, and handsome brown color are manufactured. This fabric is woven from the thick rope of silky fibres, called the byssus, or beard, by which the shell is moored to the bottom of the sea when it is found.

BLEAK—LEUCISCUS ALBURNUS.

The shell containing on

M. JAQUIN'S EXPERIMENT.

one valve a collection of strange-looking little figures, and on the other a string of pearls, the original of which is at the British Museum, is a species of mussel found in Chinese waters. This fact explains at once the existence and growth of pearls. In the one case small metal images are carefully inserted between the mantle and shells of full-grown mussels taken one by one from their natural beds; these foreign substances, imbedded in the soft muscular substance of the living animal, become in time completely incrusted with a thin coating of nacre, and appear as though they were the natural products of the shell, which by this living miracle in producing his images is supposed to attest the existence of the god. To furnish the other valve, which the reader will perceive contains a chaplet of pearls, the ingenious Mongolians have recourse to a variety of methods. One is by taking a portion of the shell itself, shaped into a spherical globule, and inserting it at a spot where the shell has been carefully scraped away. The failure of some experiments of this sort in the common fresh-water mussel of our own waters is probably owing to the fact that the shell was left unscraped, and buttons of mother-of-pearl merely placed upon the animal in the open shell.

A year generally suffices to cover these nuclei with a thin but perfect envelope of nacre, but each year, by adding a new coat, renders the pearl more perfect.

Another method is by piercing the shell with bits of silver wire, by which means adherent pearls are formed. Not only, however, are the processes of nature followed and natural pearls produced by artificial means, but pearls are now manufactured on a large scale without the aid of any shell-fish whatever. About two hundred and twenty-two years ago Moïse M. Jaquin, a citizen of Paris, a bead-manufacturer, one of those inventive geniuses who are not above taking a hint or suggestion from the most casual circumstance, happened to be walking in the garden of his country-house near Paris, when his attention was attracted by a remarkable silvery lustre on a basin of water. We can imagine M. Jaquin at once all interest and attention at what almost any other man would pass, and which undoubtedly thousands on thousands had passed, without giving the matter a thought. "Ah, ciel!" murmurs the Frenchman, "if I could but give my beads such a lustre! Pray what has produced this effect upon the basin of water?"

The old servant, who has regarded the sudden interest displayed in such a trifle, we can well imagine, with some contempt as well as surprise, answers his master, speaking for the whole world: "Master, it is but the fish; some ablettes happened to be crushed in the water; it is nothing."

Nothing! yes, nothing to the stupid servant, nothing to the rest of the world; but to a practical inventive genius like that of M. Jaquin it is a discovery, it is a fortune, it is an opening up of a new branch of commerce that feeds, clothes, and supports whole communities, and keeps them busy.

M. Jaquin saw that the lustrous sheen he so much admired was indeed produced by the countless scales of the little fish called the bleak—*Leuciscus alburnus*. He at once began experimenting. The scales he dried and reduced to powder, and this he used as an enamel, with which small beads of wax alabaster were coated externally. These, though beautiful, were unsatisfactory, and he soon began to use hollow glass beads. He now took the scales of the fish, thoroughly washed and rubbed them successively several times. The different portions of water used in these washings he suffered to settle. The water being carefully drawn off by siphons, our pearl-maker found a lustrous matter of the consistency of oil remaining at the bottom. This substance is called by the French "essence d'Orient," or essence of pearl. Our pearl-maker, after sundry ineffectual attempts to preserve it from soon becoming putrid, at last succeeded by keeping it in volatile alkali. The further process of pearl-making consists in blowing this essence of pearl, combined with melted isinglass, into hollow beads made of a peculiar kind of fine glass of a bluish tint. These having received an even and perfect incrustation on their inner surfaces, are filled with a mucilage of fine gum-arabic, and having been perforated with a needle and threaded on a string, are ready for sale. For one ounce of the lustrous material used in coating the inside of the shells, no less than a thousand fish are required. Fortunately this kind of fish is very abundant, or there might have been some probability that the bleak, becoming extinct as a fish, would only continue to exist in the form of artificial pearls.

The remaining shell in the illustration is a representation of our common river mussel, from which from time to time really valuable pearls are taken. A friend of mine found a beautiful pink-coral-colored gem in one of these shells on the banks of the Tennessee River.

In the world under the waters are lovely flowers of every hue, instinct with life and passion, which brighten with pleasure and pale with pain, which wave about on long stems in the shifting currents, as earthly flowers do to the varying zephyrs, or sit in conscious beauty thick clustered on a rough-ribbed branch of coral, or, breaking from their parent stems by a strange metabasis unknown to the vegetable analogues, become wanderers and vagabonds for the rest of their lives. Among these submarine flowers none show a rarer beauty or greater brilliancy than the coral polyps. The tenderest and most subtle grays, the most suggestive and softest carnations, and royal purple, robe these little polypidoms—"daughters of the sea"*—creatures that were, until a hundred and fifty years ago, universally believed to be marine flowers and trees.

Strange flowers and trees, stalks and branches covered with bark, from which proceed buds that open into flowers, and bear seeds that reproduce the coral; but the stalks, instead of being herbaceous or woody like those of vegetables, are horny or calcareous; the buds and flowers, endowed with animal life and intelligence, are sensitive and perceptive beings; the petals, opening out into rosettes, are so many arms, feelers, or tentacles that move about in search of food, which seizing upon, they convey to their common axis or centre, where is placed the mouth, and devour. This animated corolla opens and shuts alternately, and on the slightest hint of danger withdraws itself into itself, until nothing but an inconspicuous little gray knob can be seen where but an instant before all was life, color, and motion.

Much has been said in praise of these little creatures in respect to their unceasing industry, and coral reefs are actually spok-

* Κορἀλλιον, from κόρη, a daughter, and αλός, the sea. Latinized, the word becomes *curalium*, and hence our word coral.

CORALS.

en of as having been built by *coral insects* for habitations, as hives are constructed by bees, or houses by masons. The fact is that no more inactive creature exists than the mature coral polyp, rooted as it is to one spot for the whole period of its existence, and only living to eat and reproduce its kind. I say "mature coral polyp," for naturalists tell us that the larvæ, which resemble whitish semi-transparent worms, swim in all directions with the greatest activity, always swimming with their thicker extremity in advance, carrying their mouths in the rear, so that they butt against any thing that happens to be in their way. The fact that the thicker extremity becomes in time the base of the polyp, and that it has a tendency to adhere to any object it encounters, soon transforms the free-swimming larva into a fixed polyp, which in turn deposits coral and sends out new colonies.

Thus is reversed the transformation of insects, which is first the motionless chrysalis and then the butterfly, while with the coral first comes the free-swimming larva and afterward the immovable polyp.

The red and pink coral of commerce is found principally off the coasts of France and Italy, where, within the rocky recesses of the sea-bottom, grow purple forests of this most valuable of all the corals. Unlike its homologues on the land, the coral loves to grow downward from the roof of some shelving rock or marine cave.

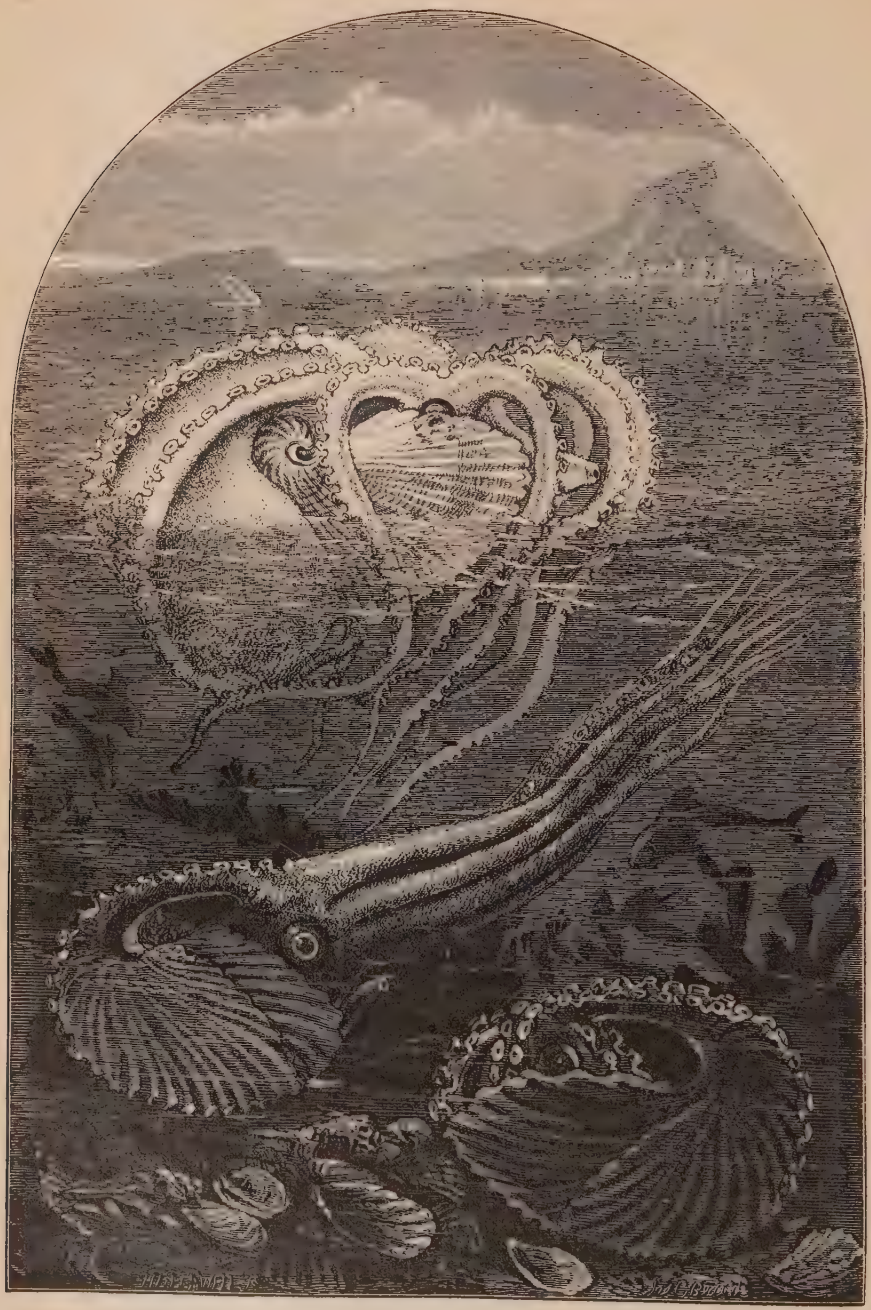
Among the curious coral formations few are more interesting than the "musical coral," or "sea-organ," so called because of the great number of stony pipes, most usually straight and slightly radiating, a representation of which, crowned with its delicate flower polyps, is given in the lower part of the engraving on page 325, in which an attempt is made to render the texture as well as the general effect of these beautiful anthozoa. A specimen of the *Dendrophyllia ramea*, one of the madrepores, is also shown at the right as a very large stem with short ascending branches, tipped each with its many-tentacled polyp. In the upper portion is also seen the fan gorgon (sea-fan), *Gorgonia flabellum*, a beautiful representative form of sclerobasic, or stony-rooted coral, the branches having a bony axis, as may be detected by the smell in burning, and uniting in an elegant net-work, the color indicating the species. Belonging to the same great family, but living separately, and possessing, even in the adult state, the power of changing their locality, are the soft-bodied polyps, the sea-anemones. Adhering to a rock by a fleshy disk that adapts itself to all inequalities, it spreads its tentacles like the petals of the flower from which it is named, and awaits its prey. "Its stomach is simply a sack suspended in the cavity of its body, into which it opens at the lower extremity by a large aperture. Between the stomach and the body walls are spaces opening into the numerous hollow tentacles, which by muscular contraction are filled out into their proper shape and size with sea-water."

Like the coral polyps, the anemone, while

SEA-ANEMONES.

retaining animal instincts and perception, repeats many of the processes of vegetable life. If a part is destroyed or damaged, it is reproduced. If an individual is torn in pieces, each fragment becomes a perfect animal. At times buds appear at the edge of the base. These buds in time become embryos, which, detached from the parent stem, grow into perfect anemones. Another mode of reproduction is equally curious. In this case the eggs are formed inside of the arms or tentacles, discharged from thence, when hatched, into the stomach, and ejected from the mouth.

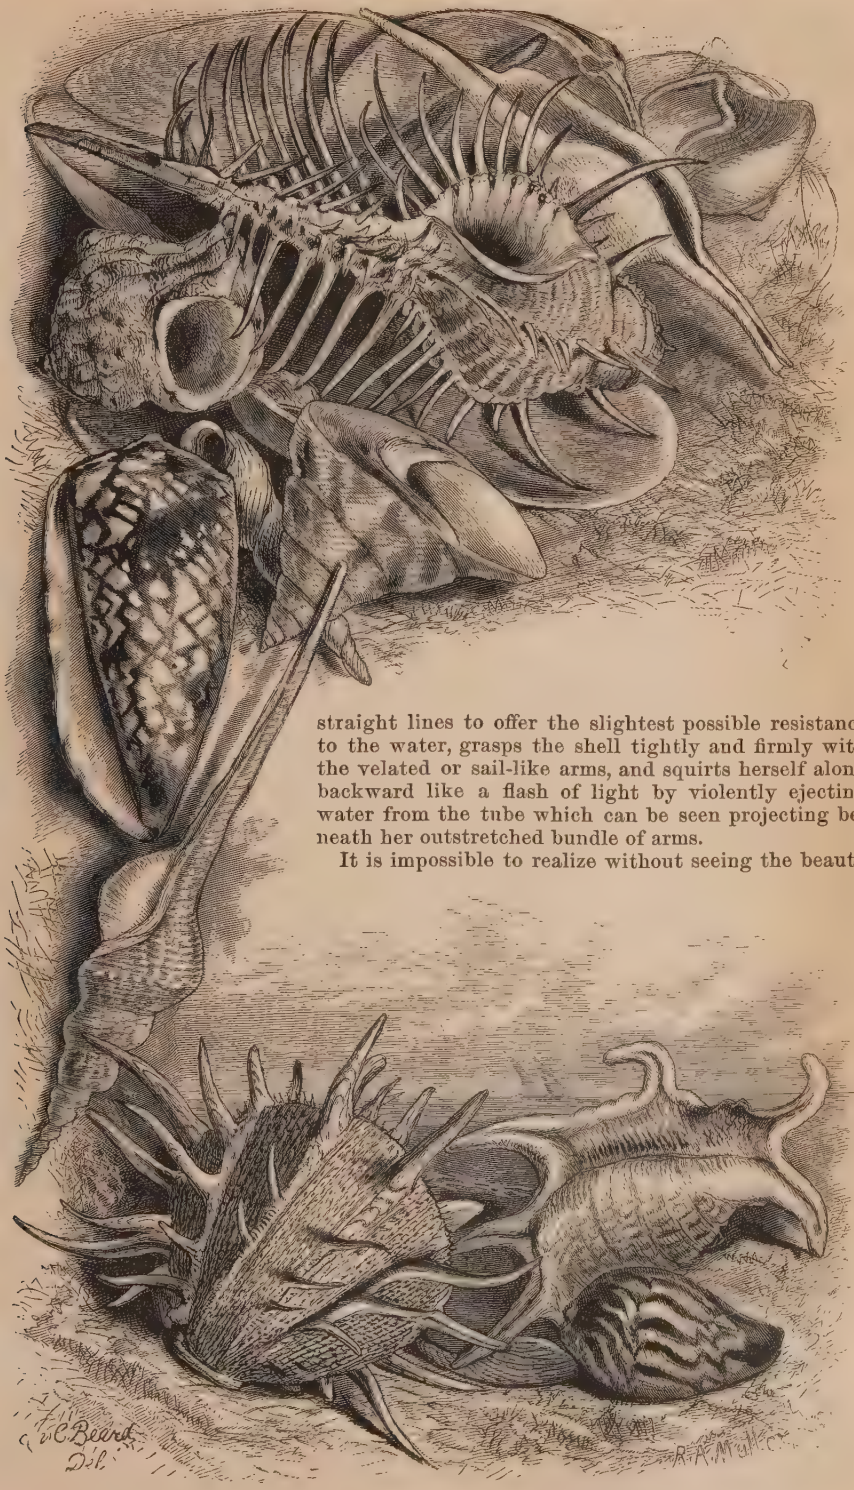
These beautiful animated flowers of the sea are of every shade and hue: white, with a pearly translucency like the petals of a lily, gray, pink like a baby's fingers, red (appropriately named "blood stars"), purple, with a plum-like bloom, fawn, golden yellow, orange, lilac, azure, and green. "One beautiful species has violet tentacles pointed with white; another, red tentacles speckled with gray; this one spreads out its green arms edged with a circle of dead white, while that opens a milk-white top circled with a border of pink. Nor," says M. Moquin Tandon, in *Le Monde de la Mer*, from which we quote, "are the stem, the disk, and the tentacles invariably of the same color; and it is because of this these living corollas possess such a variety of hues. Behold an anemone with a golden body, a disk of a plum-color, surrounded by tentacles of white; a second has a red centre, with tentacles of gray; in a third the centre is green and the tentacles yellow. So Nature diversifies her countless creations, and upon the same theme plays endless variations."



The anemone just beneath the shrimp in the illustration on page 326 is the *Actinoloba dianathus*, displaying its furry plume of tentacles fringed and cut like the petals of a pink. It has a variety of colors—orange, cream-color, pink, olive, red, or silvery white. It can at its own caprice assume widely different forms, and, fortunately for owners of aquaria, is very hardy. Its English name is the plumose anemone. On the left, serpent-crowned with its Medusa-like crest, is the snake-locked anemone. Though it has not the brilliant colors of the preceding species, it is a remarkably pretty anemone, with its crown of tentacles waving "like a thin blue cloud" upon the summit of its elongated stem. The object furthest to the right is the same anemone closed. That immediately beneath the snake-locked anemone is called the beadlet, because of the deep blue turquois-like protuberances placed around the disk: *Actinia menembryanthemum*. "It is extremely variable in color, ranging through all the changes from scarlet to crimson, from crimson to orange, from orange to yellow, from yellow to green. Even the same individual," says J. G. Wood, "is subject to change of color, being evidently influenced by various external conditions, such as light, food, and the purity of water in which it is placed." The gem pimplet, *Bunades gemmacea*, a very showy species, is seen placed lowest in the illustration. Its thick tentacles are marked with white oval spots, and there are six white bands on the body. It is remarkable for the resemblance it bears, when closed, as seen in the darker object at the right of the illustration, to an echinus, or sea-urchin, stripped of its spines.

In the same great class as the anemones, but higher in the order of creation, is one of the most exquisitely beautiful of marine objects, the celebrated argonaut, or paper nautilus, so called because of the extreme thinness of the shell, its former name being given it in allusion to its fabled sailing powers, in relation to which that Darwin of the ancients, Aristotle, says: "The nautilus polyp is of the nature of animals which pass for extraordinary, for it can float on the sea; it raises itself from the bottom of the water, the shell being reversed and empty, but when it reaches the surface it re-adjusts it. It has between the arms a species of tissue similar to that which unites the toes of web-footed birds; when there is a little wind, it employs this tissue as a sort of sail."

Indeed, until a comparatively recent period, all accounts of the animal represented it as using its delicate shell for a boat, its tentacles as oars, and its expanded mantle as a sail. The truth, however, is strange enough, without having recourse to fiction. One of the most extraordinary circumstances connected with the animal is the fact that it is not united to the shell it secretes, and can be entirely separated from it, as if one should evolve a boat or a house from his own substance, which would grow with his growth, and heal when injured, and yet which he could quit and leave behind him when he chose.



The dilated extremities of two of the arms, as seen in the cut (page 328), cover up the shell on the exterior, and have secreted its substance, and by their broad expansion moulded it into shape; they clasp the shell firmly, and serve to retain the animal within it. The figure lowest in the illustration represents the nautilus withdrawn within its shell. The large expanded membranes at the extremities of the arms cover the greater part of the shell, while their supports, set with suckers resembling those of the cuttle-fish, are bent over the remainder of the animal. The large eye is seen peeping with a wide-awake expression over the edge of the shell, the bases of the arms are arched over and beyond it, and clusters of eggs are seen sheltered under the arch of the expanded arms.

When the nautilus is taking a leisurely stroll, she walks upon her head. I say

NAUTILUS.

"she," for it is only the females which secrete shells, the males being very insignificant, worm-like creatures. Withdrawing her body as far as possible into her shell, madame turns herself in such a manner as to rest upon her head, and, using her arms to walk upon, creeps slowly along, sometimes taking a strong hold with her cup-like suckers on some projecting rock, and swinging herself from one projection to another. At other times, desiring a swifter mode of progression, she assumes the appearance and attitude shown in the middle figure, extends her six arms in parallel

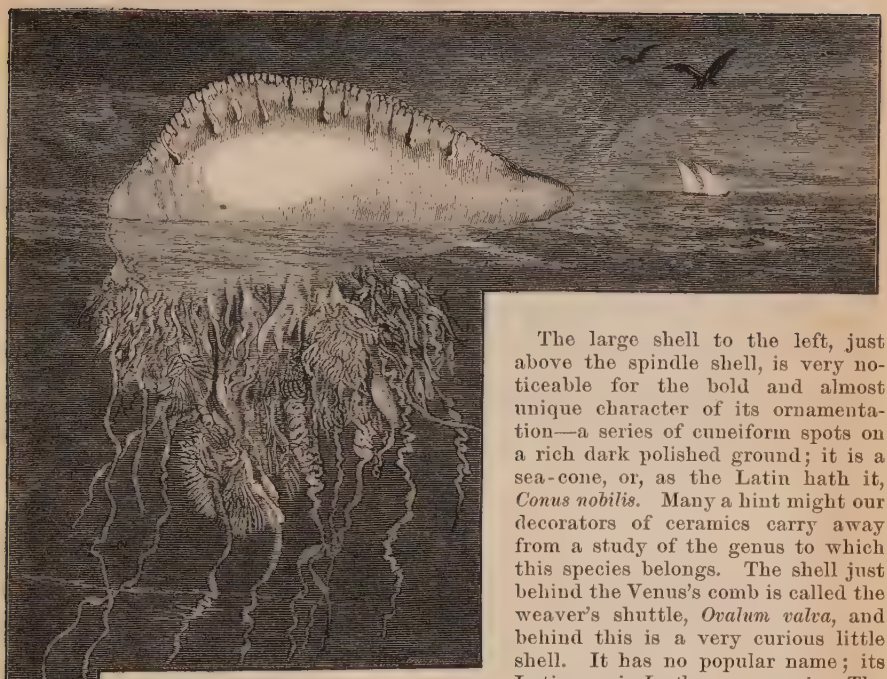
straight lines to offer the slightest possible resistance to the water, grasps the shell tightly and firmly with the velated or sail-like arms, and squirts herself along backward like a flash of light by violently ejecting water from the tube which can be seen projecting beneath her outstretched bundle of arms.

It is impossible to realize without seeing the beauty

SEA-SHELLS.

UMBELLULARIA AND SEA-PEN.

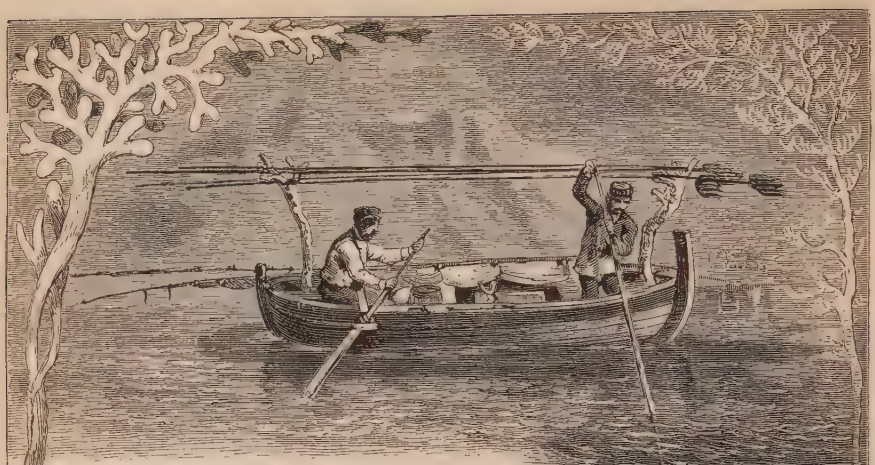
of this dainty creature. "It appeared," writes Mr. Rang, describing one of these polyps which had been captured alive, "a mass of silver, with a cloud of spots of a most beautiful rose-color, and a fine dotting of the same, which heightened its beauty. A long semicircular band of ultramarine blue, which melted away insensibly, was very decidedly marked at one of its extremities: that is the keel." Thus it appears more like a fairy in a boat of unearthly and enchanting beauty as it floats upon a summer sea than the unattractive form which its preserved corpse exhibits in alcohol.



There are none of our readers, we venture to say, who have not admired the gorgeous richness or the tender delicacy of the colors, and the strange eccentricity or exquisite grace of the forms of sea-shells. All elegant curves, all gradations of spirals, all manner of spines and protuberances, all varieties of radiating lines, seem exhausted in their formation.

What can surpass the shell called Venus's comb, seen in the centre of the upper part of the engraving on page 329, in the Japanese-like combination of elegance and grotesqueness in its formation? It may be said that the law of its being is that every part should develop into thorns or spines. Every part of its surface not occupied by spines is covered with tubercles, which are nothing else than spines in a state of arrested development, and even the markings in its mouth take the form of spines. On the left of the illustration, with its projecting beak crossing that of the last-named shell, is a species of the same genus. In this shell another law of development obtains, decreeing that knobs or rounded nodules shall take the place of spines, and certainly a more tuberculated object it would be hard to imagine. On the lower part of the illustration that extends along the left side of the page is the spindle shell, carrying its spire into the upper half of the illustration. The shell is pearly white, and ornamented with the most delicate imaginable spiral grooves, following the form of the shell in parallel lines, and crossed by subtle undulations running longitudinally from one extremity of the shell to the other. The end of its beak or spire just crosses the Nilotic top, which in turn rests upon the turret shell. Upon the shore, at the bottom of the illustration, rests a remarkable group of shells. The one to the left, the *Spondylus regius*, is probably the rarest shell in the sea. At one time there were to be found but three imperfect specimens in the museums of Europe. It is related that a learned professor in Paris once sold all his own personal possessions, and even his wife's jewelry and silver spoons, to purchase one of these rare

VIRGULARIA.



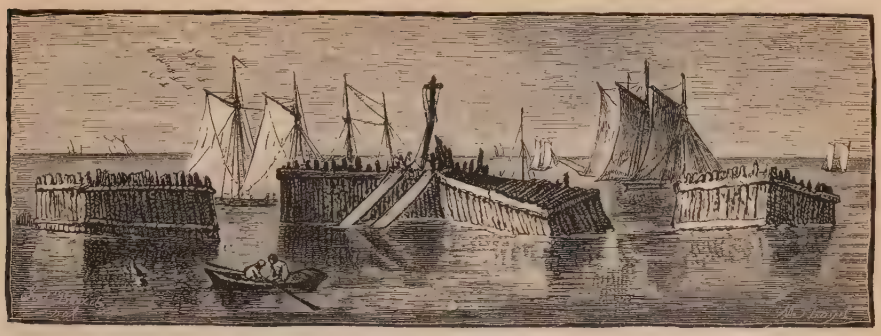
PORTUGUESE MAN-OF-WAR (PHYSALIA ATLANTICA).

specimens, but was so overwhelmed by his indignant helpmate's reproaches on returning home with the shell in his coat-tail pocket that, completely losing his presence of mind, he incontinently sat down upon it and broke it in pieces. The verdict of many a good housewife would probably be, "And served him right." However, we are told the shell was not so *very* badly broken, after all, and they kissed and made up. "The moral to which perhaps is," using the words of the duchess in *Alice behind the Looking-Glass*, "things don't turn out so badly, after all, if you will only use plenty of patience and plaster." The large shell at the right is called a spider shell, *Pteroceras chiragra*, though certainly its resemblance to that class of the animal kingdom might be stronger. The shell immediately beneath it is one of the so-called cowries, *Cypræa undata*. The beautiful and thoroughly artistic markings upon this genus of shells are almost infinitely varied.

The large shell to the left, just above the spindle shell, is very noticeable for the bold and almost unique character of its ornamentation—a series of cuneiform spots on a rich dark polished ground; it is a sea-cone, or, as the Latin hath it, *Conus nobilis*. Many a hint might our decorators of ceramics carry away from a study of the genus to which this species belongs. The shell just behind the Venus's comb is called the weaver's shuttle, *Ovalum valva*, and behind this is a very curious little shell. It has no popular name; its Latin one is *Ianthana communis*. The iantha inhabit the deep sea. Travellers have sailed for many days through wandering tribes of these mollusks, which were buoyed up by a vesiculous foam-like mass of small eggs, and but for the power they possess of withdrawing and contracting themselves inside their shells, and thus decreasing their volume and increasing their weight so as to sink beneath the surface, they would be the sport of every gale.

I can not pass from this subject without presenting my acknowledgments to the accomplished artists who engraved these shells and the cut of the nautilus. Seldom has box-wood been made to show more perfectly the texture and character of the object represented.

So strange are some of the forms of marine life that an account of them, unsupported by the most undeniable evidence, would be incredible. A being, for instance, like the so-called sea-pen, represented in the lower part of the illustration on page 330, seems to have no more object or significance than the pen flourish of the writing-master, which pen flourish it so much resembles. It can not swim; it has not even any means by which it can fasten itself to any one spot; it is at the mercy of the waves and currents. Yet it is very beautiful, and as it is phosphorescent, it presents a magnificent sight in the darkness. It is allied to the sea-rushes, which, like the sea-pen, are not single organizations, but consist of a community of polyps like the coral-trees. They are



SPONGE-FISHING.

found in the Mediterranean. Those with long stems bearing at their summits clusters of blossom-like zoophytes are called umbellularia, the others virgularia. Inhabitants of less frigid seas resemble plants with petiolate leaves of a brilliant yellow color covered with white semi-transparent flowers, which, of course, are the polyps.

The truest animal plants, however, are, without doubt, the crinoids, or stone-lilies. With them the external resemblance is almost perfect to the minutest particulars. They resemble a flower borne upon a stem, terminating in an organ called a calyx, which is, properly speaking, the body of the animal. Branches issue from the main stem, which at its base bears a sort of spreading root planted amid the rocks, and capable of growing by itself and nourishing the stem. These can be seen in the upper corner of the illustration containing a representation of the coral.

Floating upon the sun-lit sea, gorgeous in azure-blue, emerald-green, rose-pink and crimson, may be sometimes seen the small fleets called Por-

SPONGE AND TURTLE PENS, FLORIDA.

tuguese men-of-war. At a distance they appear like veritable miniature vessels, with canvas spread to favorable gales, bound for an unknown port, and perhaps navigated by Lilliputian crews. As a specimen is examined more closely, however, this resemblance vanishes, and the examiner finds instead a pear-shaped, elegantly crested air-sac, floating lightly on the surface of the water, and giving off from its under surface numerous long and complicated appendages, which stretch out behind the floating community—for it is a compound animal—sometimes to the length of thirty feet. Woe be to the unlucky bather who encounters these envenomed filaments, for their touch deranges the whole nervous system, and causes exquisite pain. Scarcely can it be called a treasure of the deep, except in respect to its exceeding beauty, which, to be sure, like that of a work of art, though beauty be its only excellence, fully entitles it to claim that appellation.

Much more tangible is the value attached to the sponges, to fill whose office and place in our domestic economy no invention of man, however ingenious or elaborate, has ever sufficed. Equally indispensable to the toilet of beauty, the laboratory of the scientist, or the operating-room of the surgeon, few articles of natural production subserve so many and such various uses. Our finest sponges come from the shores of Greece and Syria. The Syrian sponge is flaxen in color and of a cup-like form, voluted, and pierced with innumerable small orifices, very firm and close of texture, and yet both soft and elastic. This sponge is particularly valued for toilet purposes, and its price is high.

Scarcely to be distinguished from the Syrian, but weightier and somewhat coarser in texture, is the fine sponge of the Grecian Archipelago. There is also a fine hard sponge, still cheaper, of a second grade, obtained from these waters. The white sponge of Syria, miscalled Venetian, is esteemed for its lightness, the regularity of its form, and its solidity.

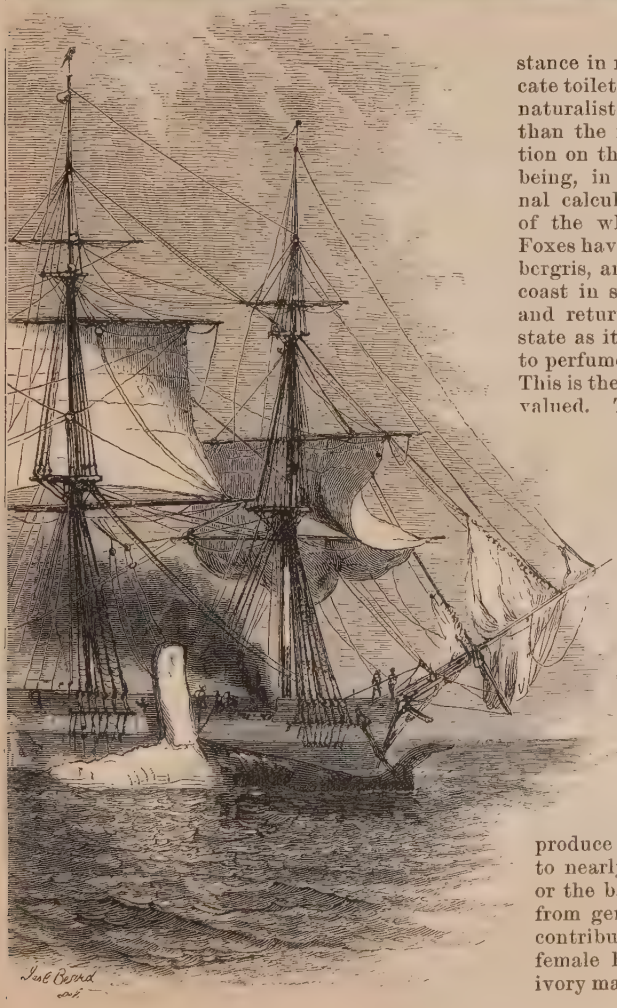
Other sorts of sponges occur in profusion, and space fails even in enumerating them. The sponges of our own waters, although far inferior in quality to these, form a valuable article of commerce, being extensively used by hostlers, and in packing steam-chests, etc. Pens or receptacles are built near the shores of the Florida Keys, to which the sponge-fishers resort to unload their cargoes of sponges and turtles, which are afterward carried to the main-land in lighters. Sponge-fishers obtain their sponges either by diving or by harpooning the sponges in shallow waters, as is represented in the illustration. Those obtained by diving are the most valuable.

Turtle-fishing is also carried on to a considerable extent in the vicinity of the Gulf of Mexico. The turtles most sought for are the ordinary queen turtle and the hawk's-bill turtle, the carapace of which supplies the tortoise-shell of commerce. The scales of the back are individually so large they overlap each other about one-third of their length. The removal of these plates is not necessarily attended by the death of the animal; but insensible and cold-blooded as the creatures proverbially are, it seems rather a cruel process, the poor reptile being exposed to a strong heat, which loosens the plates so that they can be readily removed.

The plates when first removed are dirty, crumpled, opaque, and brittle—quite useless for the purposes of manufacture. Their valuable qualities are developed by a liberal use of hot water and steam. Under this treatment they become soft, pliable, and capable of becoming amalgamated together by pressure, so that masses of any size or thickness can be readily formed.

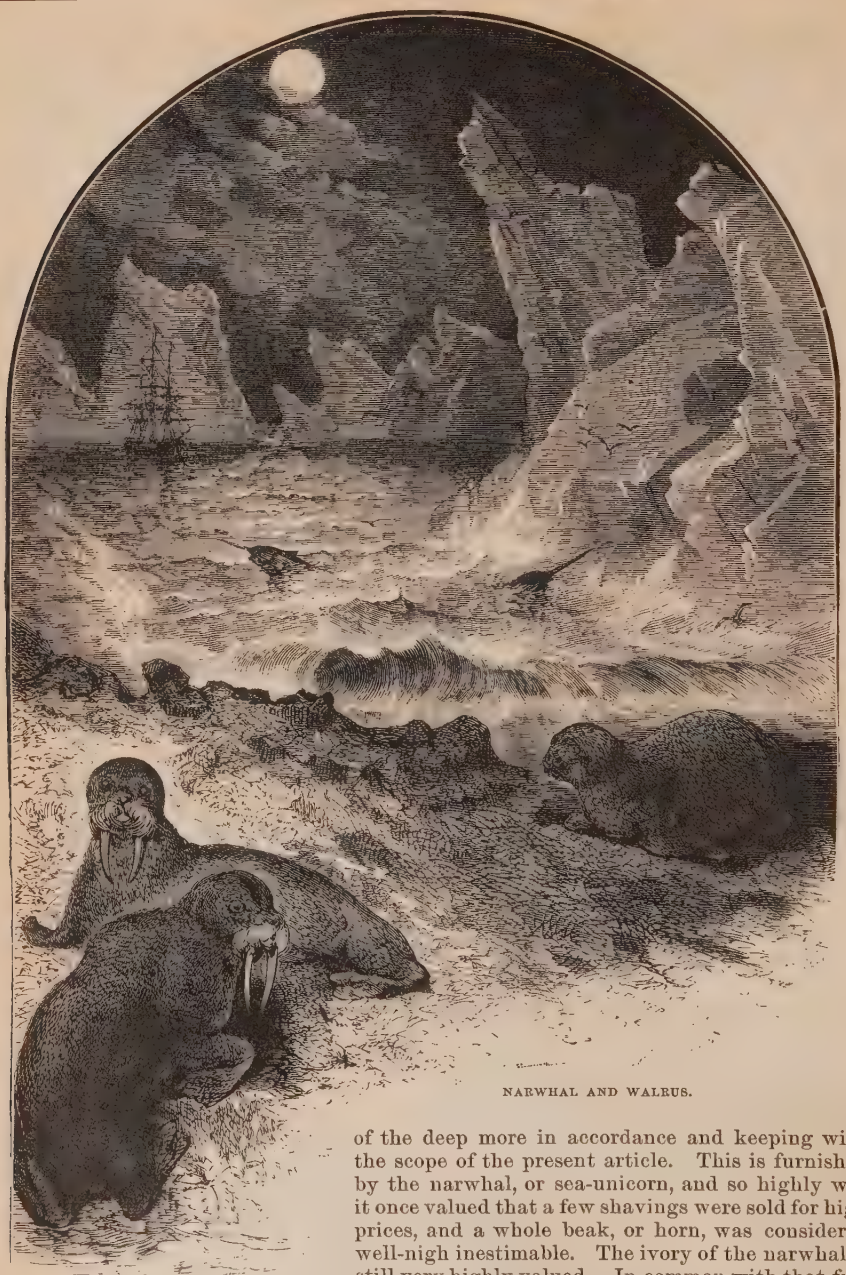
"In the neighborhood of Cuba," writes M. Moquin Taudon, "a most peculiar method of securing the turtle is pursued. They train, or at least take advantage of, the instinct of a fish—a species of remora. This fish is called by the Spanish *revé* (reversed), because its back is usually taken for its belly. It has an oval plate attached to its head, whose surface is traversed by parallel ridges; by this plate it can firmly adhere

to any solid body it may choose. The boats which go in quest of turtle carry each a tub containing some of these revés. When the sleeping reptiles are seen, they are cautiously approached, and as soon as they are judged to be near enough, a revé is thrown into the sea. Upon perceiving the turtle, its instinct induces it to swim toward the creature, and fix itself firmly upon it by its sucking disk. Sooner would the revé allow itself to be pulled to pieces than quit its hold. A ring is attached to the tail of the fish, to which a cord, made of the fibre of the bark of the palm-tree, is fastened. As soon as the revé is firmly attached to the turtle the fishermen haul in the line, bringing the fish and the turtle. By a peculiar manipulation the revé, which can not be pulled off, is induced to let go his hold, and is returned to his tub, ready for the next hunt."



CATCHING TURTLES.

Perhaps the most complete metamorphosis of the character and associations connected with any sub-



AMBERGRIS.

stance in nature is found in the delicate toilet perfume, ambergris, which naturalists tell us is nothing else than the result of a fit of indigestion on the part of the sperm-whale, being, in fact, a kind of intestinal calculus, or portion of the food of the whale imperfectly digested. Foxes have a great partiality for ambergris, and congregate on the seacoast in search of it. They eat it, and return it in exactly the same state as it was swallowed, in respect to perfume, though changed in color. This is the white ambergris so highly valued. Thus, after passing through the digestive organs of two animals, it retains its delicate and subtle perfume, which rivals that of the fairest flowers, and also retains its value for the toilet.

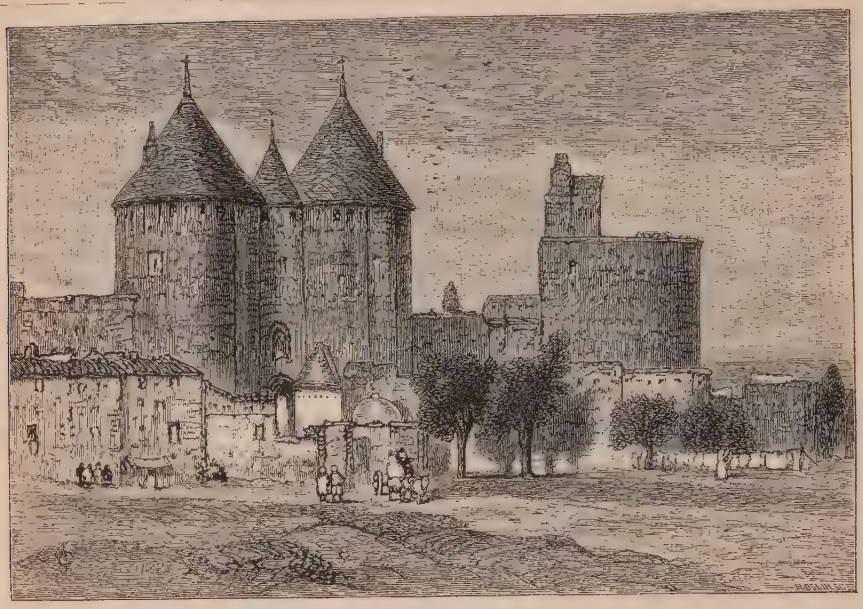
This substance, however, is, I hardly need write, by far the least valuable contributed by the cetacea to the human race. Not to enlarge on the other products—such as the oil obtained from the blubber, which, unfortunately for the animals that produce it, is so great a treasure as to nearly lead to their extinction, or the baleen, or whalebone, which from generation to generation has contributed to form and fashion the female half of civilized society—ivory may be specified as a treasure

NARWHAL AND WALRUS.

Jas. Beard Del.

of the deep more in accordance and keeping with the scope of the present article. This is furnished by the narwhal, or sea-unicorn, and so highly was it once valued that a few shavings were sold for high prices, and a whole beak, or horn, was considered well-nigh inestimable. The ivory of the narwhal is still very highly valued. In common with that furnished by the tusks of the walrus, it has the valuable property of retaining its beautiful snowy whiteness, which, unlike the elephant's ivory, it does not lose with age; it is also solid, very hard, and capable of receiving a high polish. Walrus ivory is of a beautiful texture, and is much valued, sharing in almost an equal degree all the good qualities of the ivory of the narwhal.

I have attempted in the scope of this article only to direct the reader's attention to the strange and beautiful forms of life that inhabit the world of waters, the great deep, which, though it seems to shut off so much of the earth from the use and habitation of man, is as necessary to his comfort, and very existence, as the dry land.



SHEPHERDS OF THE LANDES.—[SEE PAGE 350.]

RAMBLES IN THE SOUTH OF FRANCE.

II.

CETTE is one of the most disheartening, melancholy places I ever visited. It lies on the slope of a steep, isolated, conical hill, and scarce any thing green larger than a bush is to be seen for miles and miles. This, however, would be no objection necessarily, for barrenness is often picturesque and suggestive; but with it all we find squalor and parvenu gentility, poverty and the jejune signs of recent wealth, so inextricably thrown together without harmony as to confuse the imagination, and leave no distinct or pleasant impression on the memory. The port, a magnificent and costly work, is almost entirely artificial, constructed partly by Vauban and partly by later engineers. It is amply protected by two breakwaters against the tremendous surges of the Gulf of Lyons, giving shelter to a large fleet of ships, and is the scene of great commercial activity. The view from the mole at sunset, the blue Mediterranean skirted by the Pyrenees, is a very pleasing picture, enlivened in the foreground by a fleet of fishing craft.

Leaving Cette and the nineteenth century once more behind me, I came to Béziers, which is a town of mediæval associations. It is charmingly situated on a declivity, by the Orb and the Canal of the South of France. It was formerly considered to be so desirable in situation that there was a proverb, "Si Deus in terris, vellet habitare Bæterris"—the Latin name of the place. The Church of St. Nazaire is well deserving attention for the beauty of its rose-window and the massive picturesqueness of the crenelated, machicolated exterior of the nave. It also has a beautiful cloister. But the chief interest at Béziers centres in the awful tragedy of which it was the scene during the wars against the Albigenses. While perhaps the Pope, and certainly many of his benighted followers, were fanatically sincere in their crusade against these sectaries, there is little doubt that with Simon de Montfort, the able and astute chieftain and leader of the crusade, the object of such a war was the overthrow of the great and independent County of Toulouse, which defi-

GATE OF NARBONNE, CARCASSONNE.

antly held nearly the whole of what is now comprised within the south of France. De Montfort aspired to the position from which he succeeded in hurling the Count of Toulouse, cunningly using the fanaticism of the age as a stepping-stone to his ambition. But he was killed by a stone from a ballista before he had fairly attained his object. The cruel, roaring tidal wave of the Albigensian crusade rolled over Béziers, and completely obliterated the population. "How shall we distinguish the faithful from the heretics?" asked one, as the assaulting hordes swept into the breach. "Slay them all!" exclaimed the Abbot of Citeaux; "the Lord will know them that are His." Seven thousand were burned in the Church of St. Madeleine, and the lowest estimate recorded does not place the total number of the slain under twenty-five thousand; some carry it as high as sixty thousand. It is known that a large number had sought refuge there before the siege.

To go from Béziers to Carcassonne is to plunge deeper and deeper into the Middle Ages. The railroad traverses a highly picturesque country—a vine-land where during the vintage the peasantry may be seen wending through green lanes bearing panniers of grapes, or leading horses drawing carts loaded with the same glistening fruit, on the way to the wine-press. Much of the wine of that region is used to mix with Bordeaux, and passes in the markets for an article greatly superior and more rare. Lucky is he who, buying Bordeaux, gets as pure a wine as this for his money, for many receive in exchange something that never grew on any vineyard in Europe. Two-thirds of the wine drank in France alone is spurious!

Part of the route to Carcassonne is among outlying spurs of the Corbières—a desolate, volcanic range running at right angles to the Pyrenees. Destitute of vegetation, they assume grotesque and savage forms, and often a rock at the summit vividly suggests an old feudal tower. One is thus prepared for the surprise which awaits him when on turning a curve he beholds the frowning, massive walls and towers of Carcassonne crowning the crest of a hill. Nothing I have ever seen in Europe so strikingly ushers before one the sad, galliard, rough, savage, glowing romance of the Middle Ages as that first view of Carcassonne—those Middle Ages whose chivalry, whose struggles, whose heroism, whose perpetual and bloody warfare, whose mailed knights and fair dames, live on the stirring, picturesque pages of Froissart.

The modern city of Carcassonne lies on a slightly broken slope between the river Aude and the canal which traverses the south of France, and here forms a little port decorated with an elegant esplanade. There is a cathedral and several fine old churches in Romanesque Gothic; the streets generally have a semi-Italian aspect—clothes hanging out of the windows on poles, women knitting and chatting in groups before the doors, and children and puppies squirming in the dust. But there is a main street, which is an ambitious but not wholly successful attempt to ape the modern airs of

TOWERS OF VISIGOTH AND OF THE INQUISITION, CARCASSONNE.

Paris or Marseilles, bordered by print-shops and windows gay with jewelry. The fame of this street has doubtless had its effect on the unsophisticated peasantry of the neighboring villages, and perhaps gave rise to the touching ballad of Nadaud, describing the life-long but never-gratified longing of an old man of Limoux to visit Carcassonne, which, lying there just over the mountain beyond his native village, seemed to his imagination the finest thing the world could show him. But not even the *pâtés de foies gras* of which the Hôtel St. Jean Baptiste makes a specialty could detain me on that side the Aude, for beyond the bridge the spirit of the Middle Ages beckoned up the steep road which leads to Carcassonne of the long ago, that remains to our day, like a corpse which has been embalmed—one of the rarest and most precious treasures bequeathed to our age by antiquity. I entered by the grand Gate of Narbonne, and left by the Gate of the Aude. Here we find the most perfect specimen of a fortified city of those times which now exists. Many cas-

CAHUZAC AND L'ÉVÊQUE TOWERS, CARCASSONNE.

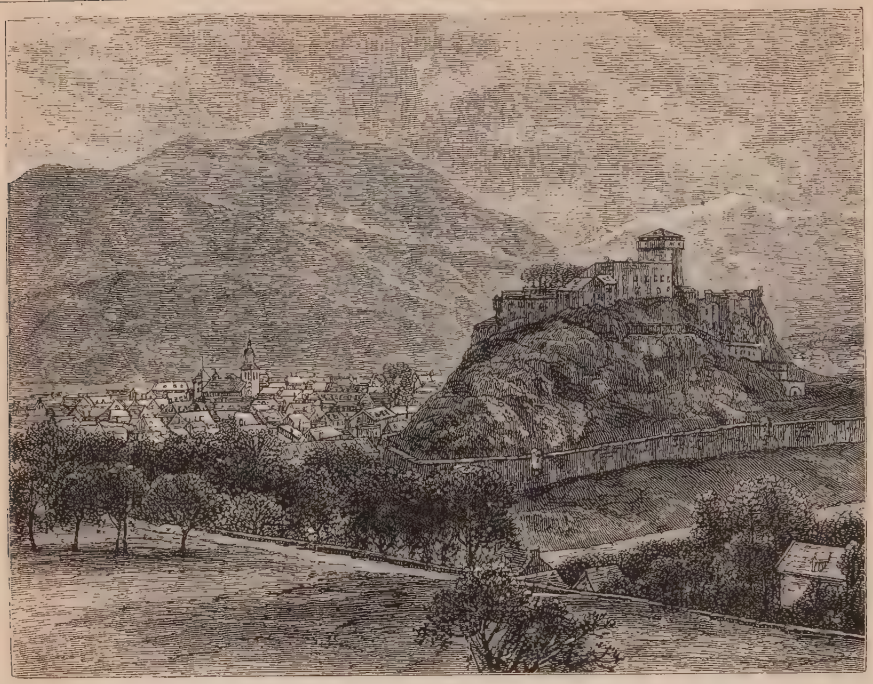
tles in tolerable preservation remain elsewhere, but here is a whole mediæval city whose walls and towers are in admirable preservation, while those parts which time has injured have been restored with much judgment by that great architect Viollet-le-Duc. The narrow, winding streets are also much the same as in former ages, and an indescribable air of musty antiquity invests the whole place. It is still occupied by several thousand people.

There is a lofty square tower, attributed to the Saracens, in which Raymond Roger, lord of Béziers and Carcassonne, was killed, after the capture of the place by Simon de Montfort. Seven hundred of the leading citizens were also slaughtered in cold blood after the siege. Another tower, which has been largely restored, was the prison of Raymond Roger, and the dungeon of the Inquisition is shown in another turret, with the chains still fastened to the well-worn central pillar, and the oubliettes below. The donjon and palace of the city is a vast and massive pile, surrounded by a moat on three sides. It is stern rather than handsome, but its halls once rang with the din of high wassail in those olden days. As Carcassonne was a cathedral town, its episcopal church of St. Nazaire was naturally a building of effective construction. It still stands within the walls in excellent preservation. Originally built in the fifth century, it was rebuilt in the eleventh and completed in the fourteenth century, at which date it was decorated with very beautiful stained glass. The interior is a marvel of lightness and architectural beauty. The crypt is very interesting, and so also is a tablet said to be the tombstone of Simon de Montfort, on which is engraved the life-size figure of a knight in full armor.

The walls that environ the old city are double, fringed with fifty towers, and surrounded on two sides by a deep moat; on the other sides the hill is so steep as to obviate the necessity of a moat. Nothing can be more impressive, more suggestive of the ages past, than a quiet stroll along these ancient battlements, where the Visigoth, the Saracen, and the knights of the days of chivalry have strode in turn, gazing upon the

plain, the river, and the far-off purple ranges of mountains which encircle Carcassonne.

The route from Carcassonne proceeds in a northerly direction to Toulouse. It is every where vastly picturesque, and full of objects of artistic and antiquarian interest, but unless one were to give years to the exploration of the almost endless attractions of Southern France, he must inevitably fall back on the principle of selection, and often regretfully neglect objects of great interest for others still more interesting beyond. The Pyrenees become prominent early in the route. Avignonet possesses a beautiful octagonal church tower, inclosing the hall of the terrible Inquisition. The campanile at Villefranche-de-Lauragais is not only imposing and beautiful, but of an altogether exceptional form. It is composed of a lofty wall flanked by towers and pierced with a double row of triangular port-holes, in which the bells are suspended. The valley of Montlaur is noted for the extreme violence with which the mistral sweeps through it, to such a degree that the speed of the railway trains is sometimes actually checked by the force of the wind.



At Toulouse I did not tarry long. An old historical city of great antiquity, and populous and prosperous, it retains, however, but little of its ancient character, being essentially a modern city. I therefore hastened on to Lourdes, through the most beautiful and romantic scenery, the road often crossed by raving torrents, and constantly drawing nearer to the heart of the sublime ranges of the Pyrenees. The railroad is characterized by some magnificent engineering, including two long inclined tunnels supported by a massive scaffolding of timbers, and a long, winding, and rapid descent from the plateau of Lannemezan into the valley of the Rene —one of the steepest railway grades in the world.

It is most fortunate for the tourist and the enthusiast that the Virgin Mary appeared at Lourdes, when she might have easily chosen a much less attractive spot for her apparition. Lourdes is, in sooth, one of the most beautifully situated towns in Europe. It nestles in the valley formed by the junction of the two gorges of the Gave and the Magnas, by the side of a winding mountain stream, around the base of a lofty precipitous rock crowned by an ancient fortress, which was impregnable until the invention of cannon. This castle has been constructed or restored at different periods, and much of it is comparatively modern, but the donjon or keep is of great antiquity, being a Roman structure with mediæval battlements, and some of the turrets at the southern end are also mediæval. Lourdes castle was besieged for six weeks by the Duke of Anjou in the fourteenth century; he captured and burned the town, but was unable to take the fortress, which was the last stronghold kept by the English in the south of France. At that time it was held for the King of England by Sir Peter Arnaut, a lord of Béarn. His fate, as told by Froissart, well illustrates the barbarism which tempered the chivalry of the age. Gaston-Phœbus, the Count of Foix, reputed

GROTTO OF OUR LADY OF LOURDES.

one of the ablest and most accomplished princes of his time, was anxious to obtain possession of the castle of Lourdes, and as Sir Peter Arnaut was one of his subjects, he invited him to visit his court at Orthez. When Sir Peter had been there a day or two, the Count of Foix suddenly demanded of him the surrender of Lourdes. Too well knowing what must be the consequences of refusing a man of such ungovernable passions when in his power, Sir Peter still manfully replied: "'I hold the castle of Lourdes from the King of England, who has placed me there, and to no other person but him will I surrender it.' The count, on hearing this answer, was exceeding wroth, and said, as he drew his dagger, 'Ho! ho! dost thou

LOURDES.

then say no? By this head, thou hast not said it for nothing!' And as he uttered these words he struck him foully with the dagger, so that he wounded him severely in five places, and none of the barons or knights dared to interfere. The knight replied: 'Ha! ha! my lord, you have sent for me hither, and are murdering me.' Having received these five strokes of a dagger, the count ordered him to be cast into the dungeon, and there he died, for he was ill cured of his wounds."

During the late Franco-German war a number of Prussian prisoners were confined in the old castle. But the chief modern interest of Lourdes now centres around the mystery of its holy grotto, where the Virgin appeared to a young girl named Bernadotte Soubiran in the year 1858. She indicated the source of a spring in the grotto which is said to have extraordinary healing powers. The water is carefully conducted into a reservoir, to which baths are attached, and is also sent to many parts of France in order to heal the physical infirmities of the faithful believer. Vast numbers of pilgrims flock hither annually for the cure of their bodies or their souls, and the place is gradually gaining the appearance of a fashionable watering-place from the constantly increasing number of hotels. It is to be regretted for the tourist who does not go there for purposes of self-maceration that these hotels are not better. At the table d'hôte two kinds of fare are provided—fasting food for the saints, and the ordinary fare for the sinners, and the guest, when he sits down, is asked which he is to take. The conversation at the table is of a singularly mixed character, alternately pious or worldly, and nuns come in from time to time during the dinner and solicit alms for some church charity.

The road to the grotto lies across a bridge over the Gave. It is lined with booths where every sort of sacred relic and trinket is for sale. In one a genuine Syrian offered relics from Palestine. The handsome girls at the other booths seemed about as jolly as ladies who besiege purchasers at other church fairs. One Spanish-looking damsel, with sparkling eyes, came dancing out into the middle of the road and besought me in her most fascinating manner to buy a rosary or a holy Béarnese cap, which would be *so* becoming.

The grotto is under a hill, and was until the appearance of the Virgin overgrown and hidden by a thicket, which is now cleared away. In the upper part of the cave is a large hole leading to an unknown depth into the hill, and there it was that Bernadotte saw the apparition, and there also in commemoration of the event a life-size statue of the Virgin is placed. Over her head is the inscription: "Je suis l'Immaculée Conception." The miracle occurred so nearly at the time of the enunciation of the doctrine of the Immaculate Conception that there are

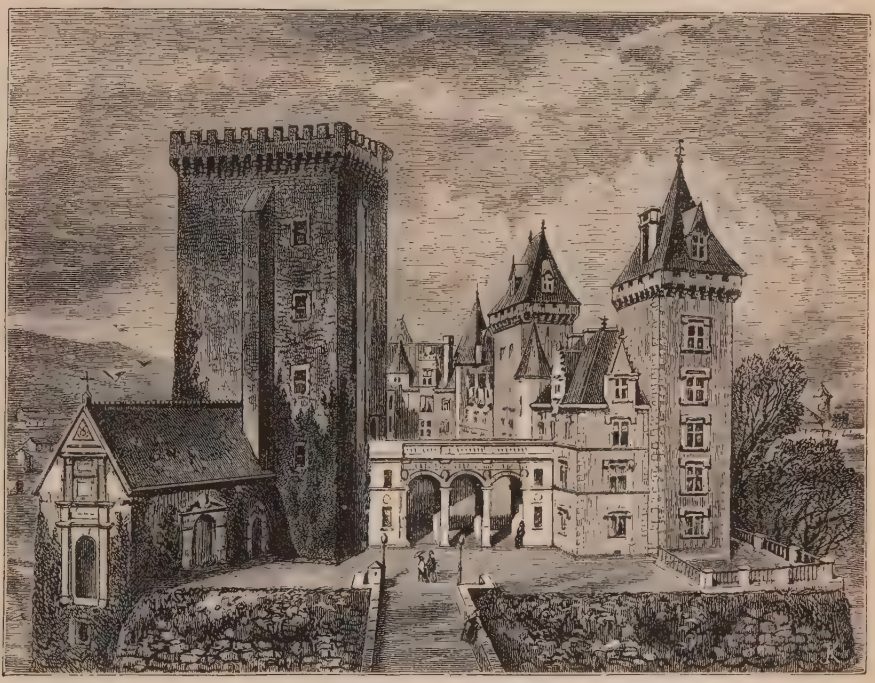
some who are inclined to imagine it was something more than a coincidence. On the hill directly above the grotto an imposing church of considerable pretensions to beauty has been erected, and adjoining are expensive dwellings for the resident priesthood and sisterhood. The grotto is protected by an iron railing, and its rocky roof is festooned with the crutches of those who have there been cured of lameness, and a variety of other characteristic thank-offerings are hung with them. It is an edifying spectacle, especially when the grotto is thronged with reverent pilgrims.

Directly in front of the cave I saw a crowd collected listening to a priest who related the history of the legend of Lourdes, and the success which had attended those who had placed reliance in the sacred fable The story was told in a simple, straightforward, but very adroit manner, and with a quiet, earnest sincerity that was qualified to convince any one not in the habit of carefully sifting evidence.

The route westward from Lourdes is of the most enchanting character. At the village of St. Betharam is a picturesque bridge exquisitely beautiful, tapestried with the clinging drapery of ivy. I was much interested in a handsome, polite young abbé and his sister, who accompanied me as far as this place. They so strongly resembled each other in looks and manner that they must have been twins. She regarded him with boundless veneration and pride, which he accepted with as much grace and facility as if it had been incense at mass.

Soon after leaving St. Betharam the old towers of Pau appeared in view, clinging to the brow of a steep eminence commanding a well-watered plain extending to the Pyrenees, where the Pic du Midi d'Ossau—a mighty obelisk of granite—soars, solitary and sublime. One expects much from the accounts he has received of Pau, and it is one of the few places of which the fame does not exceed the reality. The position of the city is simply magnificent, and its picturesqueness is enhanced by the deep ravines which intersect it, lined with antique houses, quaintly peaked, and studded with dormer-windows. On the west side, on the edge of the acclivity, is the park, very handsomely laid out with noble forest trees. To the eastward, on the same line, are the old château and the Hôtel Gassion and Hôtel de France—a trio of imposing buildings. I hope it is not treason to the old castle of Henri Quatre to say that the Hôtel Gassion is the finest of the three externally, and I may add that in its internal arrangements, and including the prospect from its windows, it seems to me the most attractive hotel I have seen in Europe. One who is lodged there may almost consider himself in a palace.

The château is historically one of the most interesting structures in France. Its gen-



BRIDGE OF ST. BETHARAM.

PIC DU MIDI D'OSSAU.

eral plan represents three sides of an irregular hollow square, to which has been added the immense, massive tower built by Gaston-Phœbus, Count of Foix, which is over one hundred feet in height, and is built of red brick with marble copings. Its slated roof was blown off by a terrific storm early in this century. The upper story has been occupied at various periods by Clément Marot, the poet, Mlle. Scudéry, the authoress of *Le Grand Cyrus*, and other celebrated personages. Four other pointed towers are connected with the château, either to include stairways or for purposes of defense. Of the latter the most interesting is the Tour Montaüzet, which means *bird-flight*, as it was at one time without stairs, and the top could thus be reached only by birds. In time of war the garrison ascended with ladders, which they pulled up after them. In this tower were the oubliettes of the castle, into which criminals were thrown alive, and were caught on knives placed upright, and there suffered excruciating torture until released by a lingering death. Sealed up by Henri IV., this dungeon of despair was again opened in the last century, and the floor was found covered with skeletons.

The château has been restored of late years, but exactly as originally designed. While none of the apartments are very large, they are of sufficient size to give dignity to the pageants which were witnessed there in former days, and their decorations are of the most sumptuous character. Brantome speaks feelingly of those times, when ladies in yellow robes and gold-lace in abundance danced in the halls of the château of Pau; when Margaret of Valois, sister of Francis I., married to the King of Navarre and Béarn, reigned there, giving shelter to the Protestants, and composing the witty, satirical, but somewhat coarse tales of the Heptameron. That the first lady of the land could write such things, and have them read by the wisest and best, in palace and hovel, without any derogation to her fair name, indicates very vividly the difference between that age and ours.

CHÂTEAU OF HENRI IV., PAU.

One enters the château by the Hall of the Guards, where the servants of the royal household were formerly in attendance. It is a grand vaulted hall, furnished with richly carved oaken chairs, and leads into the dining apartment of the officers of the king, from whence we pass into a magnificent apartment called the Salle d'Armes, where the sovereigns of Béarn and Navarre banqueted in days of yore. Here, also, the chevaliers of the kingdom received knighthood; hence the name of the hall. Here is preserved an impressive statue of Henri IV., taken from the life. The ceiling is a very beautiful specimen of the decorative art of the Franco-Italian Renaissance. Many gay, many romantic, many tragical, scenes have occurred in this banqueting hall. By a noble stairway the first floor above the *rez-de-chaussée* is reached, which contains the reception hall—a spacious and splendid apartment, scarcely surpassed in the sumptuousness of its carvings and furniture by any other hall in France. Here, in the year 1569, ten Roman Catholic noblemen, prisoners of war, after being royally entertained in the banqueting hall, were all assassinated, by order of Jeanne d'Albret, as they ascended from dinner. The elaborate ceiling, the mantel-piece of the wide fire-place—an exquisite specimen of decorative art—all captivate the admiration of the visitor, and make it difficult to realize that such a tragedy was once enacted on that very floor where he stands and gazes amazed.

The bed-chamber of the sovereigns was built by Gaston-Phœbus, and has in turn been occupied by him, by Louis XI., Francis I., Charles V., Isabella II., and Napoleon III. The Boudoir of the Queen is a choice little apartment, hung with some very fine specimens of Gobelin tapestry, representing six scenes from the career of Henri IV.; an engraving of the one representing the parting of that sovereign and Gabrielle d'Estrées is

given here. All these apartments are decorated with historic bits of furniture, credences, chests, and bedsteads of oak or ebony —exquisite specimens of the household art of past ages.

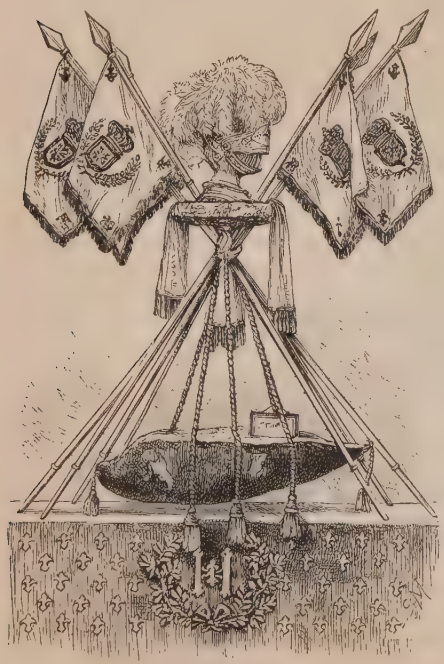
In the second story from the ground is the suite of rooms occupied by Abd-el-Kader and his family during his captivity in France. On the same floor is also the most historically interesting apartment in the château—the room in which Henri IV. was born. Jeanne d'Albret, daughter of Marguérite of Valois, was a woman fitted by nature to grapple with the turbulent age in which she lived. According to D'Aubigné, the Protestant chronicler, who had the misfortune to be the father of Madame De Maintenon, who brought about the revocation of the Edict of Nantes, Jeanne d'Albret was "a princess having nothing of the woman about her but the sex, a soul entirely given to manly things, a mind mighty in great affairs, a heart unconquerable by adversity." She crossed France in order that her child might be born in the castle of Pau, according to her promise, and sang a Béarnese song when she brought Henri IV. into the troublous world which he was to leave by the poniard of the assassin. The grandfather of the royal infant rubbed his lips with garlic—a most potent eye-opener—and moistened the infantile palate with a draught of native wine. The lad was brought up to endure every physical hardship, and when he was fifteen his mother Jeanne took him to La Rochelle and placed him at the head of the Huguenot army.

In the same apartment is preserved the cradle of Henri IV., the shell of a large tortoise, suspended on a cluster of spears. There is no doubt of its authenticity. During the Revolution of '93 it was rescued from the mob who invaded the castle, and carefully concealed until the return of the Bourbons. There are various other rooms of interest in the château, but enough has been already said to indicate the importance of the associations which cling around this venerable building.

GOBELIN TAPESTRY AT PAU: HENRI IV. PARTING FROM GABRIELLE D'ESTRÉES.

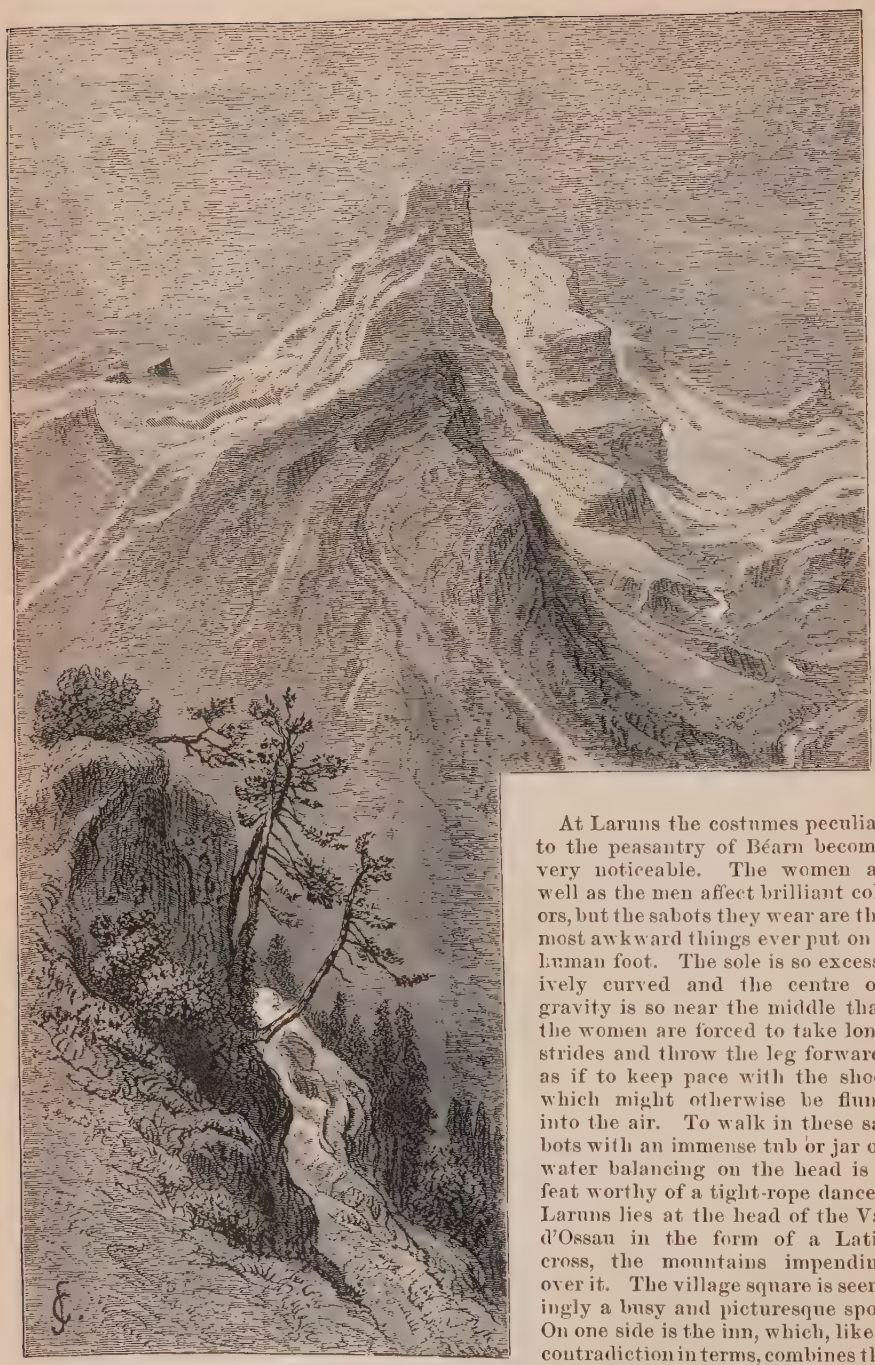
While at Pau I concluded to visit the thermal resorts at Eaux Bonnes and Eaux Chaudes, in the heart of the Pyrenees. This was done by diligence. I engaged an end seat on the top, but thought I should have a fight to secure my rights, as the postilion, who had doubtless been liberally "tipped," had sold my right to another gentleman, who finally concluded to abandon a place to which he had no claim. The Béarnese are a money-loving, fiery, hot-headed race; the men are handsomer than the women, and I saw many who reminded me of the type represented by the well-known features of Henri Quatre—rubicund, keen-eyed, jo-

vial, but canny. And the blue cap of felt which many of them wear aids them in retaining the aspect of a distinctive nationality. In fact, they do not consider themselves French any more than the Scotch accept the title of English. By marriage Béarn became an appanage of the French crown, but the people—a mixture of Gascon, Spanish, Basque, and Moorish blood—retain with pride the name of Béarn. "You are a native of Pau?" may be asked of a resident. "Yes," she replies. "Then you are a Béarnaise." "Ah, mais non." "But why not?" you reply in turn. "Because my parents were French."



I was much entertained by the conduct of the driver of the hotel coach. When the postilion was out of sight he said to me: "I'm forbidden to ask a fee, and I wish monsieur to understand distinctly that I do not ask for a fee, nor even for a little good-for-nothing *pourboire*. Nothing of the sort. But I wish to put it to monsieur as a mere matter of equity, as a proposition, whether it is quite fair for this lazy postilion, this greedy, selfish, grasping, puffed-up snip of a man, this sneaking, niggardly, strutting, unbearable jackanapes of a *coquin*, to be wheedling around every passenger I take up to the hotel and raking in the coins into his never-satisfied palm, while I who do the work get nary a sou? I put it to monsieur whether this is exactly as it should be?" and he shrugged his shoulders and looked at me significantly. I gave the cunning varlet a franc, and he almost went down on his knees with fulsome gratitude. Notwithstanding, I tried not to be cynical.

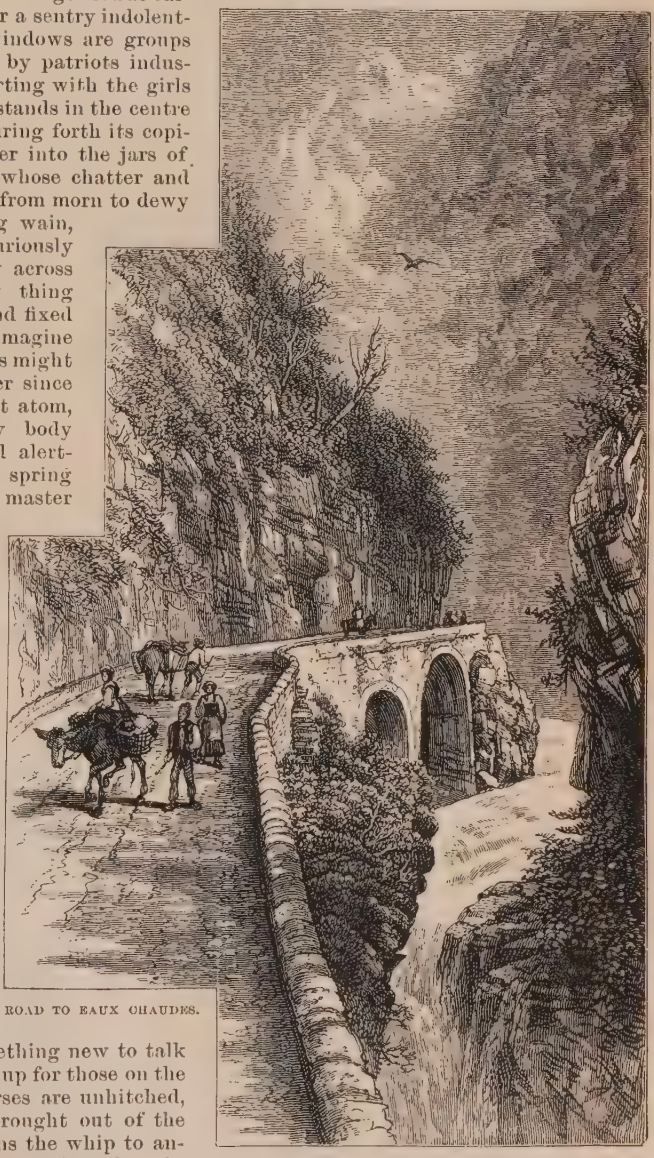
The road to the Pyrenees lay through the most enchanting scenery, along the well-watered, mountain-circled valley of Ossau, which runs at right angles to the



CHARCOAL VENDER, PAU.

chain of the Pyrenees, that towered more and more grandly as we proceeded. They are never as lofty as the Alps, and lack the cold, serene sublimity of the glaciers, but they are sufficiently high to be very grand, every where grooved with tremendous gorges and faced with vast precipices, and pinnacled and battlemented with needle-like peaks or natural ramparts and towers, offering every element of the picturesque, and constantly stimulating the imagination. The ravines are ever resonant with the roar of torrents, and eternal snow rests on the highest summits. The Pic de Ger and the Pic du Midi d'Ossau, both within easy distance from Eaux Bonnes, are each over ten thousand feet in height. These mountains are still the haunt of the bear and the wolf, which lurk in the remote fastnesses, and come forth sometimes to steal a calf or a kid and grapple with the huntsman. Another quarry which invites the adventurous rifleman is the ibex, or izard, which, like the chamois, seeks the highest and most inaccessible cliffs, and

CRADLE OF HENRI IV.



PIC DE GER.

gives the sportsman a chase full of perilous excitement.

At Bielle we passed a Gothic chapel and a Roman tower perched on the summit of two hills rising side by side out of the plain.

At Laruns the costumes peculiar to the peasantry of Béarn become very noticeable. The women as well as the men affect brilliant colors, but the sabots they wear are the most awkward things ever put on a human foot. The sole is so excessively curved and the centre of gravity is so near the middle that the women are forced to take long strides and throw the leg forward, as if to keep pace with the shoe, which might otherwise be flung into the air. To walk in these sabots with an immense tub or jar of water balancing on the head is a feat worthy of a tight-rope dancer. Laruns lies at the head of the Val d'Ossau in the form of a Latin cross, the mountains impending over it. The village square is seemingly a busy and picturesque spot. On one side is the inn, which, like a contradiction in terms, combines the old and the new. Below are the stables, sandwiched between a cabaret and a barber shop; the rude pavement before them is industriously scratched by the canaille of barn-yard fowls, and serves as an idling rendezvous for the swaggering blades of the place, in every costume from that

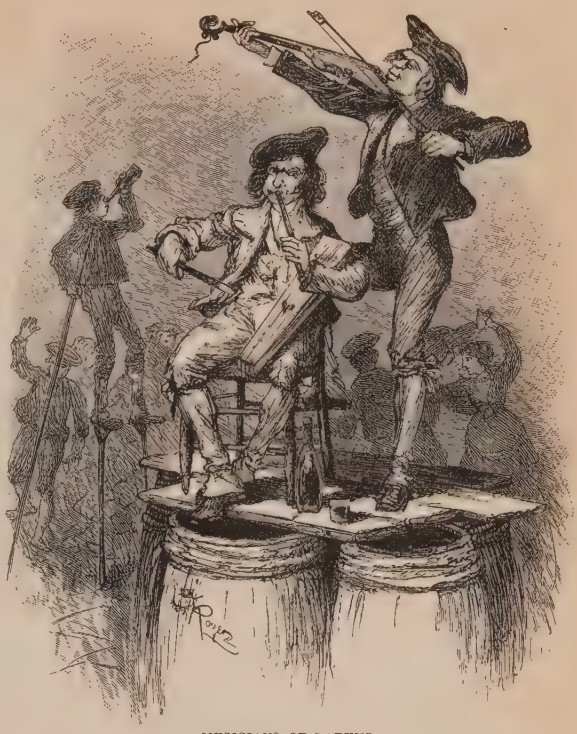
of the hunter of the ibex to the latest style from Paris, sported by a *gaillard* in a gaudily painted dog-cart. Above, like warts on the face of this very dilapidated building, are attempts at balconies, which give support to dames of various ages in equally various dress, languidly ogling the youths below. On the opposite side of the square is a cluster of elderly buildings used as barracks. Before the door a sentry indolently stalks, and in the windows are groups of uniforms inhabited by patriots industriously engaged in flirting with the girls at the fountain, which stands in the centre of the square, ever pouring forth its copious flood of liquid silver into the jars of the Béarnese damsels, whose chatter and gossip are heard there from morn to dewy eve. A rude creaking wain, drawn by oxen curiously yoked, squeaks slowly across the area, and every thing seems so somnolent and fixed that one can easily imagine that this order of things might have existed there ever since the creation of the first atom, when suddenly every body starts to new life and alertness, as if some secret spring had been touched by a master showman. "Crack! cr-r-r-ack!" explodes the snap of a whip with the sharpness of a rifle, followed by a perfect fusillade of similar sounds, and then down a narrow lane rolls the huge yellow diligence, drawn by five horses, and loaded to the very last straw with officers and ladies, travellers and couriers, babies, nurses, dogs, postilions, drivers, bandboxes, trunks, panniers, and carpet-bags. The event of the day has arrived for Laruns; the gods be praised! now there will be something new to talk about. A ladder is put up for those on the top to descend, the horses are unhitched, and a fresh relay is brought out of the stable, the driver resigns the whip to another hand, the postilion goes into the cabaret to wet his lips at the expense of some generous traveller, and then once more the crack of the whip is heard, the diligence is off like a dream, and Laruns is again left for twenty-four hours more to its own lazy devices.

ROAD TO EAUX CHAUDES.

At this place the road begins to climb, winding deviously, until at dusk Eaux Bonnes is reached. Here we find a romantic village, which owes its origin entirely to the thermal springs, that are supposed to possess sanitary qualities which ought to cure half the ails of a suffering humanity. The hotels really form the village. They are numerous, generally excellent, but as expensive as usual at fashionable resorts. So narrow is the gorge that the buildings generally stand plumb against the side of the mountain, and in many cases space had to be made by blasting. The hamlet is di-

LARUNS.

vided in two by a curtain of solid rock, which has been cut through to allow the passage of a cross street. Every coign of vantage has been employed as a perch for rustic seats and arbors, approached by winding walks. A torrent rushes by from the mountains, and the Pic de Ger soars like a sentinel tower to a stupendous height above the roofs of the village.



I went from Eaux Bonnes to Eaux Chaudes by carriage; the distance is perhaps four miles by a fine road which has been constructed with great engineering skill in the face of serious difficulties. The position of the cluster of inns which form the latter place is well indicated by the cut on page 354. The gorge here takes a wedge-like form, edge downward, and allows just room for a narrow street and a roaring torrent, whose music under the windows serves to lull the weary traveller to pleasant dreams.

Perhaps a thousand feet above the Eaux Chaudes is the hamlet of Goust, consisting of just seven houses grouped on a miniature plateau near a deep precipice—a very curious little settlement. Several interesting grottoes are also within easy distance of the hotels, doubtless located there in order to add to the interest of the invalid who thinks his particular malady may be healed at Eaux Chaudes. It is but a few miles from this place to the Pic du Midi d'Ossau, and the Spanish frontier. The road which traverses this narrow gorge has been the scene of much smuggling, which is still carried on, but in much less degree than formerly.

Turning away regretfully from the noble scenery of the Pyrenees, I now started northward and homeward. Near Dax is a place called Baights, which deserves mention as one of the few instances in the French language, but too common in English, in which it is impossible to detect the pronunciation from the spelling. Baights is pronounced Batét! At Dax one begins to enter on the famous Landes—vast, marshy, alluvial plains, devoted chiefly to grazing. Here and there are low clumps of pine and cedar, which only serve to add sadness to the desolate mountainous landscape. The shepherds of the Landes tend their flocks on stilts, partly that they may see farther, and partly to keep their feet dry, which is said to be an important condition to good health; while the sheep are feeding they sit on a third stilt and knit stockings. But the French government, abhorring monopolies, proposes to strike a blow at the monopoly of these simple peasants who are devoting so large a share of France to the mere matter of sheep pasturage. A system of drainage is now in operation which is to reclaim these marshlands some time before the Millennium.

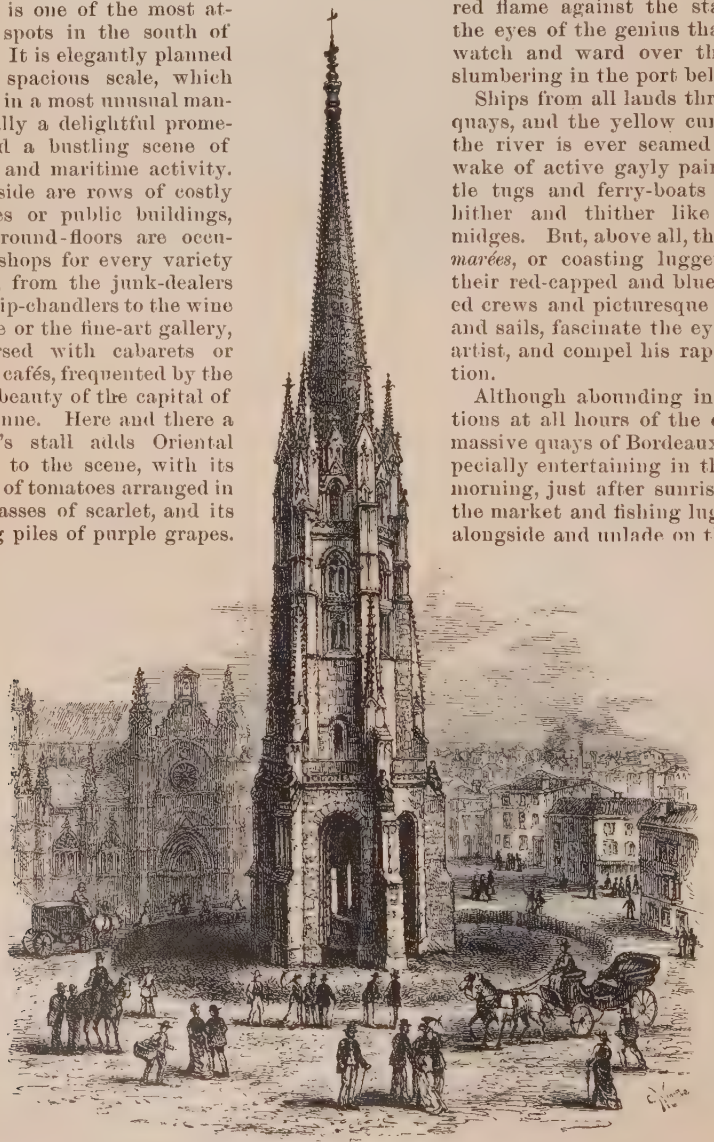
To arrive at Bordeaux after leaving Pau is to enter the nineteenth century once more. Here is a splendid city of two hundred thousand inhabitants, bustling, prosperous, and enterprising, situated, like New Orleans, along the crescent line formed by a curve of the Garonne, there no longer blue, but tawny and turbid with silt. But notwithstanding its modern aspect, Bordeaux boasts a hoary antiquity, and possesses still some interesting relics of past ages—one or two old gates,

a splendid cathedral, which has been too completely restored to be thoroughly interesting as an antiquity, and the Church of St. Michel, founded in 1160, and completed three centuries later. Some exquisite carvings decorate the windows of this beautiful structure. Close at hand is the campanile, standing entirely alone. It is a very graceful tower three hundred and thirty feet high, resting on four piers, and for the lightness of the design and the daring shown in its construction deserves to rank with the finest monuments of the Middle Ages.

MUSICIANS OF LARUNS.

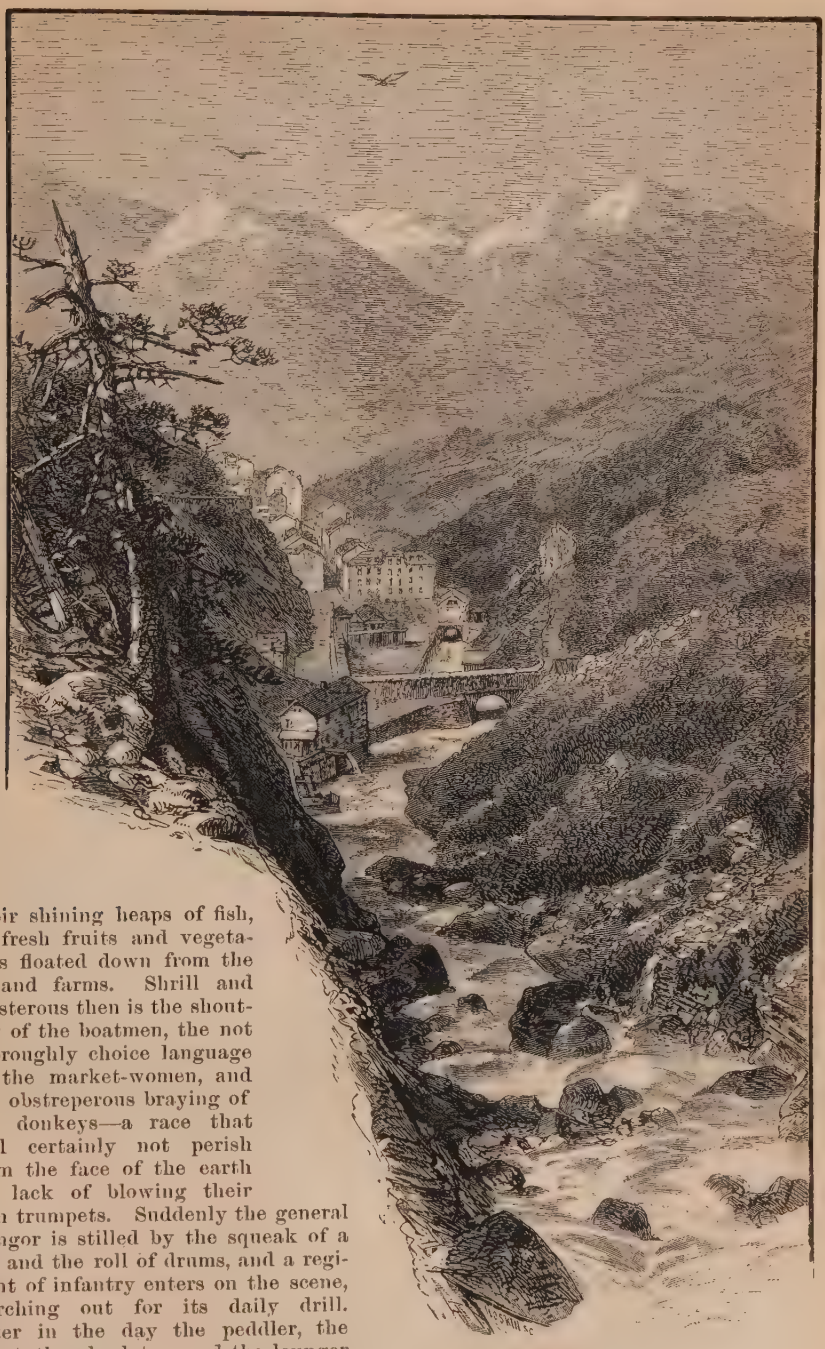
In the crypt under this campanile the visitor is introduced to an extraordinary spectacle. The space now laid out as a square around the tower was formerly a cemetery. Part of the ground so occupied had the remarkable property of preserving the bodies of those buried in it. Those thus mummified are now ranged, to the number of seventy, in a standing position around the wall of the crypt. It is a ghastly spectacle. The skin has the strength of parchment, and the features are in several cases still quite distinguishable, retaining the expression they bore in the hour of death; and where the flesh has shrunk away, the veins and arteries are quite intact; and even the dress in which they were buried is yet in tolerable condition. On some the lace is so perfect that the century is indicated in which occurred the death of the individual. The sacristan had his story by heart, but he told it well; and to one who had never heard it before it was quite impressive. "There," said he, in a solemn, eloquent tone, tapping the corpse with his lantern as he spoke—"there you see a young maiden in the heyday of youth; her death was peaceful; the smile yet lingers on those rounded features where sorrow had grooved no deep furrows. How well preserved is the graceful curve of those breasts, the emblems of beauty! beneath that bosom, gentlemen, once beat a heart that was instinct with love. That lace which is still so perfect on her vesture indicates the circumstances of her death: she was young, she was rich, and she died not earlier than the fourteenth century. Yes, gentlemen, when she died there was sorrow in many hearts!" And thus for each one he repeated some appropriate remarks. I was sorry, and so also was the sacristan sorry, with a sort of melancholy rage, when, on ascending to daylight once

PEASANT WOMAN OF LARUNS.



more, and the visitors were paying him the regular fee, two young priests, unmindful of the solemn lesson to which they had just listened, darted off without waiting to pay the showman. In a tone somewhat different to that in which he had spoken in the crypt he demanded where these knaves had gone, and then rushed after them in hot haste. I waited to learn the result; he found them after some search, and squeezed the two francs out of their reluctant purses. 'Tis but a step from the sublime to the ridiculous.

The quay of Bordeaux, extending for miles along the banks of the Garonne, is one of the most attractive spots in the south of France. It is elegantly planned upon a spacious scale, which makes it in a most unusual manner equally a delightful promenade and a bustling scene of business and maritime activity. On one side are rows of costly residences or public buildings, whose ground-floors are occupied as shops for every variety of trade, from the junk-dealers or the ship-chandlers to the wine magazine or the fine-art gallery, interspersed with cabarets or dazzling cafés, frequented by the wit and beauty of the capital of the Garonne. Here and there a huckster's stall adds Oriental splendor to the scene, with its panniers of tomatoes arranged in broad masses of scarlet, and its tempting piles of purple grapes.



At intervals the long row of buildings is broken by the wide mouth of one of the avenues leading up to the heart of the city. Here a grim, venerable gate, portcullised and flanked with pepper-box turrets, still remains brooding on the hurrying ages, and carrying the mind back to the turbulent, chivalrous days of the Black Prince; there the pillared porticoes of some stately mart of trade bring one back to the bustle of to-day. Midway lies a noble square, laid out with avenues of trees; where it faces the water two lofty bronze pillars, like triumphal columns, and adorned with rostral decorations, lift twin beacons of red flame against the stars, like the eyes of the genius that keeps watch and ward over the ships slumbering in the port below.

Ships from all lands throng the quays, and the yellow current of the river is ever seamed by the wake of active gayly painted little tugs and ferry-boats darting hither and thither like water-midges. But, above all, the *chasse-marées*, or coasting luggers, with their red-capped and blue-jacketed crews and picturesque rigging and sails, fascinate the eye of the artist, and compel his rapt attention.

Although abounding in attractions at all hours of the day, the massive quays of Bordeaux are especially entertaining in the early morning, just after sunrise, when the market and fishing luggers lie alongside and unlade on the quay

ST. MICHEL'S TOWER, BORDEAUX.

EAUX BONNES.

their shining heaps of fish, or fresh fruits and vegetables floated down from the upland farms. Shrill and boisterous then is the shouting of the boatmen, the not thoroughly choice language of the market-women, and the obstreperous braying of the donkeys—a race that will certainly not perish from the face of the earth for lack of blowing their own trumpets. Suddenly the general clangor is stilled by the squeak of a fife and the roll of drums, and a regiment of infantry enters on the scene, marching out for its daily drill. Later in the day the peddler, the priest, the charlatan, and the lounger about town appear; men stand in knots, tapping snuff-boxes, and wagging their heads over the last political manifesto or the Terpsichorean graces of the ballet the night before; and through it all the creaking of loaded wains is heard, the crack of whips, the rattle of tackle-blocks, the swearing and the songs of shouting crews, and the shipment of the red blood of the vineyards of France, to be wafted

EAUX CHAUDES.

away to make glad the hearts of the *jeunesse dorée* in distant lands.

The chief importance of Bordeaux lies, however, in its commerce. Its coasting and foreign trade includes the annual entry of nearly eight thousand vessels to its quays. The export of wine probably exceeds that of any other port in the world. The famous wine-growing district of Bordeaux wines is concentrated on a low peninsula along the left bank of the Garonne, between Bordeaux and the mouth of the river. There are situated many noble châteaux, each the centre of some celebrated vineyards, lying along the valley of the Garonne, which rolls by ever ready to bear on its throbbing bosom the mighty ships which convey their ruby product to foreign shores. Some miles below Bordeaux the Dordogne meets the Garonne. There is nothing very striking about the river-banks, but there is every where that indescribable picturesqueness which lends such fascination and enchantment to every landscape of France.

"AND TOLD HIM 'TWAS DECIDED THAT HIS FLOCK AND HE SHOULD SEVER."

OUR TRAVELLED PARSON.

I.

For twenty years and over our good parson had been toiling,
To chip the bad meat from our hearts and keep the good from spoiling;
But finally he wilted down, and went to looking sickly,
And the doctor said that something must be put up for him quickly.

So we kind of clubbed together, each according to his notion,
And bought a circular ticket in the lands across the ocean;
Wrapped some pocket-money in it—what we thought would easy do him—
And appointed me committee-man to go and take it to him.

I found him in his study, looking rather worse than ever,
And told him 'twas decided that his flock and he should sever.
Then his eyes grew wide with wonder, and it seemed almost to blind 'em;
And some tears looked out o' window, with some others close behind 'em.

Then I handed him the ticket, with a little bow of deference,
And he studied quite a little ere he got its proper reference;
And then the tears that waited, great unmanageable creatures,
Let themselves quite out o' window, and came climbing down his features.

II.

I wish you could ha' seen him, coming back all fresh and glowing,
His clothes so worn and seedy, and his face so fat and knowing;
I wish you could have heard him when he prayed for us who sent him,
And paid us back twice over all the money we had lent him.

'Twas a feast to all believers, 'twas a blight on contradiction,
To hear one just from Calvary talk about the crucifixion;
'Twas a damper on those fellows who pretended they could doubt it,
To have a man who'd been there stand and tell them all about it.

Paul maybe beat our pastor in the Bible knots unravelling,
And establishing new churches, but he couldn't touch him travelling,
Nor in his journeys pick up half the general information;
But then he hadn't the railroads, and the steamboat navigation.

And every foot of Scripture whose location used to stump us
Was now regularly laid out, with the different points of compass.
When he undertook a picture, he quite natural would draw it;
He would paint it out so honest that it seemed as if you saw it.

An' the way he chiselled Europe—oh, the way he scampered through it!
Not a mountain dodged his climbing, not a city but he knew it;
There wasn't any subject to explain in all creation,
But he could go to Europe and bring back an illustration.

So we crowded out to hear him, much instructed and delighted;
'Twas a picture show, a lecture, and a sermon, all united;
And my wife would wipe her glasses, and serenely pet her Test'ment,
And whisper, "That 'ere ticket was a very good investment."

"'TWAS A PICTURE SHOW, A LECTURE, AND A SERMON, ALL UNITED."

III.

Now after six months' travel we were most of us all ready
To settle down a little, so's to live more staid and steady;
To develop home resources, with no foreign cares to fret us,
Using home-made faith more frequent; but the parson wouldn't let us.

To view the self-same scenery time and time again he'd call us,
Over rivers, plains, and mountains he would any minute haul us;
He slighted our home sorrows, and our spirits' aches and ailings,
To get the cargoes ready for his reg'lar Sunday sailings.

He would take us off a-touring in all spiritual weather,
Till we at last got homesick like, and seasick altogether;
And "I wish to all that's peaceful," said one free-expressioned brother,
"That the Lord had made one cont'nent, and then never made another."

Sometimes, indeed, he'd take us into sweet, familiar places,
And pull along quite steady in the good old Gospel traces;
But soon my wife would shudder, just as if a chill had got her,
Whispering, "Oh, my goodness gracious! he's a-takin' to the water!"

"I FOUND HIM IN HIS GARDEN, TRIM AN' BUOYANT AS A FEATHER."

And it wasn't the same old comfort when he called around to see us;
On a branch of foreign travel he was sure at last to tree us;
All unconscious of his error, he would sweetly patronize us,
And with oft-repeated stories still endeavor to surprise us.

IV.

And the sinners got to laughing; and that fin'lly galled and stung us
To ask him, Would he kindly once more settle down among us?
Didn't he think that more home produce would improve our souls' digestions?
They appointed me committee-man to go and ask the questions.

I found him in his garden, trim an' buoyant as a feather;
He pressed my hand, exclaiming, "This is quite Italian weather.
How it 'minds me of the evenings when, your distant hearts caressing,
Upon my benefactors I invoked the Heavenly blessing!"

V.

I went and told the brothers, "No, I can not bear to grieve him.
He's so happy in his exile, it's the proper place to leave him.
I took that journey to him, and right bitterly I rue it;
But I can not take it from him: if you want to, go and do it."

Now a new restraint entirely seemed next Sunday to infold him,
And he looked so hurt and humbled that I knew some one had told him.
Subdued like was his manner, and some tones were hardly vocal;
But every word he uttered was pre-eminently local.

The sermon sounded awkward, and we awkward felt who heard it.
'Twas a grief to see him hedge it, 'twas a pain to hear him word it.
"When I was in—" was maybe half a dozen times repeated,
But that sentence seemed to scare him, and was always uncompleted.

As weeks went on his old smile would occasionally brighten,
But the voice was growing feeble, and the face began to whiten;
He would look off to the eastward, with a listful, weary sighing,
And 'twas whispered that our pastor in a foreign land was dying.

VI.

Thé coffin lay 'mid garlands smiling sad as if they knew us;
The patient face within it preached a final sermon to us:
Our parson had gone touring on a trip he'd long been earning,
In that Wonder-land whence tickets are not issued for returning.

O tender, good heart-shepherd! your sweet smiling lips, half parted,
Told of scenery that burst on you just the minute that you started!
Could you preach once more among us, you might wander without fearing;
You could give us tales of glory we would never tire of hearing.

ADMIRAL HIRAM PAULDING.

THE 19th day of August in the year 1812 should be a day ever memorable in the annals of American history, for on that day the charm of British invincibility on the high seas was broken by the capture of his Majesty's frigate *Guerrière* by the United States frigate *Constitution*.

If a not unnatural spirit of vainglory took possession of the American mind at this quite unlooked-for result of the contest between two ships of war of very nearly equal force, it may be imagined the exuberant joy which filled all patriotic hearts at the tidings of the victories subsequently achieved on the Lakes, where the odds were certainly not in our favor.

The halo which to the popular imagination surrounded Perry's victory on Lake Erie, and the enthusiasm created by his terse dispatch announcing his success, have in a measure obscured the more sanguinary, hotly contested, and *important* battle on Lake Champlain; but, says Fenimore Cooper, "in the navy, which is better qualified to enter into just estimates of force and all other circumstances that enhance the merits of nautical exploits, the battle of Plattsburg Bay is justly placed among the very highest of its claims to glory." For it was the stubborn determination of Macdonough and his men which rolled back the tide of invasion, and freed the State of New York from all fear of British incursion during the remainder of the war.

The death of Commodore John Hodges Graham, whose munificent bequest of $150,000 to charitable purposes in this State was but lately announced, left but one officer, and it is believed but one survivor, of the famous fight on Lake Champlain, whose history, the record of a long and useful life spent in the service of his country, it is the purpose of this paper briefly to chronicle.

If it but serve as a stimulus to the apparently waning patriotism of the day, by showing the rising generation what manner of men were those who against very great odds upheld the honor of the American flag, and vanquished the traditional "mistress of the seas," the purpose of the writer will have been accomplished.

Hiram Paulding, late the senior rear-admiral on the retired list of the United States navy, was the son of the celebrated John Paulding, one of the captors of Major André, and was born in Westchester County, New York, on the 11th of December, 1797. He was consequently, at the time of his death, in his eighty-first year.

Brought up on his father's farm, the subject of this sketch led the usual life of a country lad, laboring at farm-work in the summer and attending the village school in winter, until he attained his fourteenth year, when Mr. Pierre Van Cortlandt, then a member of Congress, sent the father a midshipman's warrant for his son. The boy, on receiving this appointment, September 1, 1811, was placed with a certain Master Gibbons, an Irish exile, for the purpose of receiving instruction in mathematics and navigation; but so soon as war was declared with Great Britain his studies were brought to a close, and he was ordered to join Commodore Chauncey's squadron on Lake Ontario.

His journey northward in the summer of 1812 was eventful enough to be recorded at length did space permit. It is sufficient to say, however, that, making the voyage to Albany in an oyster schooner, and from thence to Utica in a lumbering old stage, at the latter place he fell in with a good-natured drum-major bound to Sackett's Harbor, and the two joined *en route* the regiment of Colonel Tuttle, which was making a forced march to the frontier. The regi-

ment reached Sackett's Harbor just in time to repel a raid of the Canadian forces which had landed in that vicinity, and now for the first time in his life the boy saw men bleeding from wounds as they were carried to the rear. His short service had already impressed Colonel Tuttle and his officers with the idea that for one so young he possessed in a remarkable degree intelligence, pertinacity, endurance, and pluck—the four essentials to a successful military career.

His fortunes, however, were not to be cast with Commodore Chauncey's command, though while with it he saw some stirring service; he was soon transferred to the *President*, on Lake Champlain, the flag-ship of the squadron of Master Commandant Macdonough, an officer of great spirit and experience, who had fought side by side with Decatur in all that officer's brilliant achievements before Tripoli. Fortunate indeed was young Paulding to have such a leader so early in his naval career.

But the years 1812–13 were not fortunate ones for the little flotilla. The *Growler* and *Eagle* were captured after a sanguinary contest, and the *President* was soon blockaded in Burlington Bay by the British squadron, Macdonough having but this one vessel—originally a transport—to oppose to the power of the enemy on the lake. Being a man of indomitable energy, he set to work during the winter of 1813–14 to *build* a squadron which should control the lake. During all this time our American seamen had many sharp skirmishes with the enemy on land and water, in which Paulding participated, and thus became inured to the vicissitudes and dangers of war. Meanwhile the *Saratoga*, of twenty-six guns, and the *Ticonderoga*, of seventeen guns, were built, other lake craft purchased and adapted to service, and by September 3 Macdonough found himself with his improvised squadron anchored in Plattsburg Bay, where he was joined by the brig *Eagle*, of twenty guns, which had been built with unexampled rapidity by the celebrated Henry Eckford, a Scotchman in our service.

About the same time the British army, admirably equipped, and nearly 12,000 strong, appeared before Plattsburg, held by General Macomb with less than 1500 men. The object of the enemy was doubtless to penetrate, if possible, as far as Albany, and the control of Lake Champlain became a matter of vital importance. One of our gun-boats in opposing the march of the British troops along the shore became disabled, and with some of the cutters of the squadron Midshipman Paulding, now attached to the *Ticonderoga*, was sent to tow her to a position of safety. In the teeth of a gale and under a heavy fire, with great difficulty and some loss of life, this, his first responsible service, was accomplished to the satisfaction of his superiors. Sir George Prevost now merely awaited the arrival of Commodore Downie's squadron to make a combined land and water attack on the Americans. At last, on the 11th September, 1814—a calm and beautiful Sunday morning—its signals were descried, and shortly after it rounded Cumberland Head, and with true British pluck, following Nelson's tactics at Trafalgar, "bows on," steered boldly for the American anchorage.

> "As they drifted on their path
> There was silence deep as death,
> And the boldest held his breath
> For a time."

A light breeze set in, and soon the hostile squadron was within range of Macdonough's broadsides—

> "By each gun the lighted brand,
> In a bold, determined hand,"
> While the flower of Britain's land
> Led them on.

The sequel is known to history. Though greatly superior in force, the enemy was completely crushed, his commodore killed, and all the large vessels captured, some row-galleys, which had previously struck their colors, only escaping because there was not a mast in the American flotilla which would bear the pressure of canvas, so riddled were they by shot. At the close of the fight, of the seventeen British banners which had previously been displayed so vauntingly, not one was to be seen.

The sanguinary nature of this memorable battle may be appreciated when it is stated that the British flag-ship *Confiance* lost in killed and wounded, out of a crew of 300, no less than 124 persons, including the commodore. Macdonough's flag-ship, the *Saratoga*, lost fifty-seven killed and wounded out of a crew of 212 persons, and the other vessels suffered in proportion.

The American squadron being short of officers, our midshipman, though under seventeen years of age, was intrusted with a lieutenant's duties, and had charge of the second division of great guns on board of the *Ticonderoga*, commanded by Lieutenant Stephen Cassin. This vessel bore the whole brunt of the attack of the British row-galleys, and was magnificently fought. Our little hero was not conscious, at the close of the long and bloody contest, that he had performed any very special service; his pride and gratification, then, may be conceived when in the darkness of the ensuing night he overheard his commander Cassin say to one of the lieutenants, "That youngster Paulding is a brave little fellow." Says Cooper, in his history, "There was a common feeling of admiration at the manner in which the *Ticonderoga* defended the rear of the line, and the noble conduct of all on board of her. Once or twice the nearest vessels thought her to be in flames, in con-

sequence of the awful rapidity of her fire." Cassin meanwhile walked his taffrail amid a shower of murderous missiles, perfectly cool and apparently unconcerned, seeming to bear a charmed life, while he directed young Paulding, who had charge of the quarter-deck guns under his eye, to train his cannon upon the advancing foe.

The consequences of the battle were immediate and important. Sir George Prevost retreated in haste, abandoning much of his heavy artillery and stores, and from that moment until the close of the war the frontier was clear of the enemy.

When peace was declared, Paulding joined the squadron of Commodore Decatur, fitted out to demand redress of the Barbary powers. On the 17th and 19th of June, 1815, he participated in the capture of the Algerine vessels *Mashoudah*, of forty-six guns, and *Estedio*, of twenty-two guns. The squadron soon appeared before Algiers, and forced the Dey to terms. Thence it proceeded to Tunis on a similar mission, and the result here can not better be told than in the words of the late Mr. M. M. Noah, of New York, our consul, who, on landing, was admitted to an audience of the Bey.

"Tell your admiral to come and see me," said the Bey. "He declines, your Highness, until those disputes are settled, which are best done on board ship." "But that is not treating me with becoming respect," said the Bey; "Hamuda Pasha, of blessed memory, commanded them to land and wait at the palace until he was ready to receive them." "Very likely, your Highness," said Noah, "but *that* was twenty years ago." After a pause the Bey exclaimed: "I know this admiral; he is the same one who in the war with Sida Yusef, of Trablis, burned the frigate." "The same," said Noah. "Hum! why do they send wild young men to treat for peace with old powers? Then you Americans do not speak the truth. You went to war with England, a nation with a great fleet, and said you took her frigates in equal fight. Honest people always speak the truth," concluded the Bey. "Well, your Highness, that was true," said the consul. "Do you see that tall ship in the bay, with a blue flag flying?—*that* is the *Guerrière;* the one near the small island is the *Macedonian*, captured by Decatur in equal fight; the sloop near Cape Carthage is the *Peacock*, also taken from the English in battle."

"The Bey," continues Mr. Noah, in his narrative, "laid down his telescope, reposed on his cushions, and with a small tortoise-shell comb set with diamonds combed his beard. A small vessel got under way and came near the Tunisian batteries; a pinnace with a few men rowed toward the harbor, and a person in the garb of a sailor was taking soundings. It was Decatur himself."

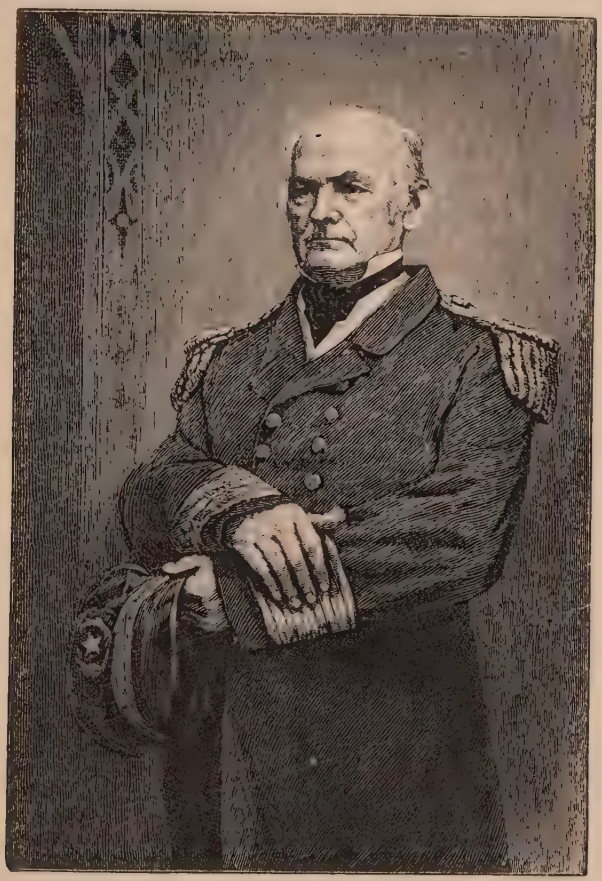
It is almost needless to add that the Bey promptly redressed all grievances, so great was the terror of Decatur's name and the prestige won by our navy in the recent war with Great Britain. The memory of these events still survives among the powers of the Barbary coast.

In April, 1816, Midshipman Paulding became a lieutenant by promotion, and until 1818, when he joined the *Macedonian*, served in the *Independence* (seventy-four) and *Prometheus* (brig), the latter in a cruise on our own coast.

The *Macedonian* made a cruise of over three years in the Pacific, during which time her officers had the great good fortune to witness one of the most daring exploits in naval annals—the cutting out of the Spanish frigate *Esmeralda*, by Lord Cochrane, from under the batteries of Callao Castle.

On his return to the United States, Lieutenant Paulding, feeling his deficiency in certain branches of science required by the naval profession, procured a leave of absence, and spent eighteen months in hard study at the Military Academy of Captain Partridge, in Norwich, Vermont, concluding his leave with some weeks spent in the disguise of a common sailor in a rigging loft in Boston, where one day his incognito was penetrated by the sudden entrance of a certain warrant officer who had served under him in the *Macedonian*.

It must be borne in mind that there were no naval academies in those days, and the opportunities afforded by the government to its naval officers for acquiring a knowledge of the scientific branches bearing on the profession were of the most meagre description. Paulding's wise foresight—characteristic of the man—enabled him to take rank with the best-informed men in the navy.



In the autumn of 1822 he joined Commodore Porter's squadron for the suppression of piracy in the West Indies, serving as first lieutenant of the *Sea-Gull*—the first steamer ever used for war purposes. This unique craft had originally been a Jersey ferry-boat, and the wits made very merry over her; but Porter rigged her as a galliot, and with her battery of three cannon she rendered very respectable service in the waters of Cuba, though the croakers in the navy declared she would founder in the first gale she encountered. In 1824, Commodore Porter's squadron having returned to a home port, Paulding was ordered to the frigate *United States*, and made a cruise of nearly four years in the Pacific, while there performing the important service of conveying dispatches from Commodore Hull to the camp of the "Liberator," Simon Bolivar. In this arduous and dangerous journey the young lieutenant traversed a belt of wild, arid, and mountainous country, making a

journey of nearly 1500 miles on horseback. An account of his adventures, under the title of "Six Weeks in the Camp of Bolivar," was subsequently printed in New York, and the pamphlet, which is exceedingly rare, is much sought after by collectors.

While attached to the frigate *United States*, Paulding, in 1826, volunteered for duty in the schooner *Dolphin*, and as her first lieutenant went to the savage Mulgrave Islands in search of the mutineers of the American whale-ship *Globe*. The *Dolphin* on this occasion was commanded by Lieutenant John Percival, better known in the navy as "Mad Jack"—a seaman of uncommon ability and fearlessness, but extremely eccentric. Among the midshipmen was the late Rear-Admiral Charles Henry Davis, who told the writer of this sketch that the boldest act he ever witnessed in all his life was performed by Lieutenant Paulding in the seizure of one of the mutineers in face of a mob of infuriated savages, several hundred in number, armed with clubs and spears. With only a cutter's crew Paulding landed, and while holding a parley suddenly seized his man, and covering his body with his human prize, marched him rapidly to the boat, a cocked pistol to his ear, the natives, who were friendly to the mutineer, being so much surprised by the audacity of the proceeding that they made no attempt at recapture until too late to do so.

A very interesting account of this cruise of the *Dolphin*, written by Paulding, was published in New York in 1831, the preface being so quaint and humorous as to show beyond dispute that all the wit of the family had not been confined to the author of "The Dutchman's Fireside."* When the *Dolphin* returned to the coast of South America, Paulding rejoined the frigate, and in 1828 found himself once more in New York.

From 1830 to 1844, though constantly employed at sea, his life was comparatively

REAR-ADMIRAL HIRAM PAULDING.

* James K. Paulding, afterward Secretary of the Navy, a cousin of the admiral.

uneventful. For two years he served in the Mediterranean as first lieutenant of the frigate *Constellation*, and in the same waters commanded the schooner *Shark*, of twelve guns, from 1834 to 1837. In February, 1837, he reached the rank of commander, and for three years commanded the *Levant*, on the West India station. In 1841, for the first time in thirty years' service, we find him on "shore duty," as executive officer of the New York Navy-yard, under Commodore James Renshaw. In 1844 he reached the rank of captain, and was sent to the East Indies in command of the *Vincennes*, of twenty guns. This cruise lasted three years, and proved the most dismal of his life, for while in China that dire scourge, the dysentery, broke out among the crew, and a very large proportion of the ship's company succumbed to its fatal effects. Spared himself, Paulding's humane and generous heart was a constant prey to the keenest emotions, witnessing the agonies he was powerless to relieve. The return of Commodore Biddle to the United States left him in command of the Asiatic station, a duty he performed, as he had ever performed all his duties, with zeal, discretion, and entire devotion to his country's interests. In 1848, after a brief respite on shore, he was ordered to command the "crack" frigate of the day, the *St. Lawrence*, of forty-four guns, and sent on a sort of diplomatic cruise to the north of Europe. This was to him probably the most interesting cruise of his life, for the French revolution had set all Europe in commotion, and the agitation for liberty extended to its remotest corners.

Our government was desirous of aiding the Germanic Confederation to establish a navy, and while at Bremerhaven several young Prussians were received on board of the *St. Lawrence* to be instructed in nautical science. Captain Paulding was invited by the late King of Prussia to visit Berlin, and was handsomely entertained at the royal palace. Accompanying Prince Adalbert, the Admiral of Germany, to Frankfort-on-the-Main, he was presented to the members of the German Parliament, who received him with great enthusiasm, and tendered him a high command in the German service, which he politely declined. It is not at all improbable that the German navy of to-day owes much of its efficiency to the ideas instilled by this American sailor into the mind of Prince Adalbert, who was an intelligent and progressive man. Captain Paulding returned home in 1851 to command the Washington Navy-yard, where he remained three years, upon the conclusion of which service he reached the highest naval position in the gift of his country, being appointed by the President to command the West India, or home squadron.

His broad pennant was at first hoisted on the old sailing frigate *Potomac* (forty-four), but later on in the new steam-frigate *Wabash*—a beautiful vessel, of great power for that day, carrying forty of the new Dahlgren cannon, and over seven hundred men.

Paulding, now in his fifty-eighth year, had reached the goal of his professional hopes, and many anecdotes are related of the ability and dignity of his administration of the affairs of this squadron at a most eventful period. The Captain-General of Cuba declared he was the most distinguished naval officer in bearing that he had ever seen in the port of Havana, and indeed he deserved the compliment. Of stalwart frame and commanding presence, he combined with dignity of mien and courtliness of address the greater dignity of intellect, and, though a strict disciplinarian, a kindly, benevolent manner irresistibly attractive to all seamen who ever came in contact with him. His officers and men universally admired and respected him, and though a man of most positive views and character, it is not known that in a long professional career of sixty-seven years he ever had a single personal enemy in the service. His popularity with the men was once amusingly illustrated during the odious *régime* of flogging. Said an old sailor (afterward a boatswain famous for his seamanship and incorrigible habit of intemperance), "I would rather have the 'old man' [meaning Paulding] lick me any day than get a first-class 'billet' from any other man."

But the command of the home squadron was no sinecure. On the 8th of December, 1857, he arrested Walker the filibuster, with all his men, at Greytown, in Nicaragua, and sent him to the United States for trial. For this praiseworthy maintenance of treaty obligations and neutrality laws he was promptly relieved from his command by President Buchanan, who hastened in a special message to Congress to disavow all complicity in Paulding's resolute act! The Ostend Manifesto had borne its legitimate fruit, and the Knights of the Golden Circle had no mind for any such doings as the arrest of their agent Walker. Commodore Paulding went into retirement with the sympathy of millions of his fellow-citizens, while the republic of Nicaragua, whose soil it was pretended he had violated, hastened to tender him its thanks, a large tract of very valuable land, and a magnificent jewelled sword, which last, Congress, in 1861, allowed him to accept.

At the period of his relief Commodore Paulding had commanded the squadron nearly three years, but for the remainder of President Buchanan's term he was utterly ignored. He bore it all very patiently, sustained by the consciousness of duty faithfully performed, and bided his time. Great events were now hastening, and the flames

of civil war soon spread far and wide. The first naval officer sent for by President Lincoln was Hiram Paulding, who was detailed to assist Secretary Welles in the Navy Department. His loyalty and devotion to his flag were every where known, and while traitors and trimmers were numerous even in the navy, his voice, at least, gave out no uncertain sound, for it summoned his comrades to the impending conflict for national unity and equal rights to all men under the flag. The noble old man who in his boyhood had seen the proud cross of St. George lowered to the Stars and Stripes amid the smoke and din of desperate battle, was not one to willingly allow a single star to fade from the union of the glorious old banner under which he had fought: so he reasoned with his life-long friend Commodore Tattnall, at heart a Union man. The two men had grown gray together in the navy, had become devoted friends in early life, had named their children after each other, and now, alas! they were to part and turn their swords against each other's breast. Tattnall, a man of chivalric impulses, is said to have shed bitter tears at this interview with his old comrade, and yet, though no sympathizer with secession, no persuasions, entreaties, or remonstrances on the part of Paulding could turn him from his inflexible resolve to cast his fortunes with his native State.

Years after, when the war had ended, the writer was present at an accidental meeting of the two men in New York city. "Why, Joe, you dear old *rebel*, how are you?" said Paulding, clapping the ex-Confederate on the shoulder with a force fit to fell an ox; and thereupon he took the broken-hearted old man to his beautiful home on the shores of Long Island Sound, where he entertained him many days, the sad chapter of the civil war being never once alluded to. Paulding's generous forgetfulness of the past was not lost on the brave sailor who at the disastrous repulse of the British on the Peiho, in China, declared blood to be "thicker than water;" and the two men parted firmer friends than ever, never again to meet on earth, for shortly afterward Commodore Tattnall died.

Among the many onerous duties devolving on Commodore Paulding in 1861 was that most disagreeable task, the destruction of the Norfolk Navy-yard.

This affair, which has been much criticised by some persons unfamiliar with all the facts, and by some military men who kept well to the rear in the dark days of April, 1861, was, under the circumstances in which Commodore Paulding found the yard on April 20, a necessity, painful but unavoidable. Vacillation on the part of the commandant and treason or indifference on the part of his subordinates had led to the scuttling of the fine steam-frigate *Merrimac* and other vessels even before Commodore Paulding had reached Fortress Monroe from Washington. This reduced affairs to such a condition that the abandonment of the yard became a necessity, the government not having the requisite force to hold it, and the destruction of the public property followed, as a consequence of the *written* orders under which Commodore Paulding was acting. His conduct received the entire approval of President Lincoln and Secretary Welles, who fully realized the stern necessity which prompted his course, it being impossible *at that time* to spare the steamer *Pawnee* for the defense of Norfolk, the national capital being itself in serious jeopardy.

In September, 1861, Commodore Paulding served as a member of the board to examine the plans of iron-cased vessels, and its report is memorable as having recommended the building of the *Monitor*—a creation of the wonderful genius of Ericsson. Shortly after this he was ordered to command the New York Navy-yard, the most important station the government possessed. His duties here were arduous to a degree; but although in his sixty-fifth year, and technically "retired," he served in this trying command during the entire civil war, infusing energy into his subordinates, and sending to the scenes of battle and blockade hundreds of vessels and thousands of men. It was entirely due to his foresight that the *Monitor* was so speedily equipped for service, and a telegram received on the night of March 5, 1862, countermanding her orders to Fortress Monroe, and instructing Captain Worden to lose no time in proceeding with his vessel direct to Washington after passing the capes, was withheld by Commodore Paulding, who had private advices of the danger of longer delay in the dispatch of this vessel to Hampton Roads. This enabled the vessel to confront the *Merrimac* on the 9th of March, and thus end her career of destruction.

In July, 1862, the grade of rear-admiral was created for the first time in American history, and President Lincoln directed by the act to appoint ten of the most distinguished retired officers to that grade. Hiram Paulding was one of the ten so appointed, and, having survived all his comrades, was, at the time of his death, the oldest admiral in the navy.

When the memorable draft riots broke out in New York city in July, 1863, the safety of the most valuable portion of the town from confusion and pillage was largely due to the energy and foresight of this veteran officer, who, not content with causing gunboats to patrol the rivers, dispatched within two hours a naval battalion of seamen and marines to report to General Wool for duty,

and moored vessels at all important points, with their cannon ready to sweep the streets if necessary. This enabled the New York police to make head against the mob, and the riot was after a time put down without other material aid.

In the course of a long, and, as we have seen, very eventful life, and in his many positions of honor and trust, Admiral Paulding always acted with ability and quiet courage tempered with discretion, exhibiting an ever-zealous devotion to the public good, which made him the recipient of several noteworthy marks of distinction.

Congress, by its joint resolution of October 20, 1814, voted him a sword for gallantry on Lake Champlain; the testimonials of Nicaragua have already been alluded to; finally King Victor Emmanuel conferred on him the decoration of the equestrian order of St. Maurice (an Italian order of knighthood), and Congress having authorized its acceptance, it was received by this sturdy republican veteran with a queer twinkle in his blue eyes. But he put it carefully away, and it is probable few of his neighbors ever knew they had an Italian knight "commendatore" residing in their vicinity.

From 1866 to 1869 the admiral was governor of the Naval Asylum in Philadelphia, and in 1870 was assigned to the merely nominal duty of port admiral at Boston, a post he did not solicit, in consequence of his age and infirmities, and which was tendered by the department simply as a compliment for past services, and to increase his rather scanty salary.

This service ended in 1871, after which time he quietly resided on his farm at Lloyd's Harbor, on Long Island Sound. Here, retired from the world and its cares, he led a peaceful, happy life, surrounded by his children and his grandchildren—his sword turned to ploughshare and his spear to pruning-hook.

For many weeks previous to his death, which occurred on Sunday, October 20, 1878, the old man had been gradually failing in health. All his old comrades in the stirring events of 1812–15 had preceded him across the dark river and into the land of shadows. He was alone, and in his moments of suffering often wearied of that loneliness, comparing his lot to that of some war-worn, weather-beaten hulk of the olden time, whose companions had long since disappeared in storm and battle. At last came the final signal from the Great Captain, and obediently the faithful seaman answered the call, and quietly departed on that unknown voyage which knows no ending.

In a lonely corner of the Huntington cemetery, on a gentle slope overlooking the blue waters of the noble Sound—the Connecticut hills in the dim distance—lie the mortal remains of Hiram Paulding, the brave, honest, patriotic sailor.

A PICTURE AND A PARABLE.

An old-time ingle, warm and wide,
Shaming our modern manners,
Where backwood monarchs, side by side,
Fling up their rival banners,
And send their gleaming cohorts fast
The flying shadows after,
Till warmth and comfort glow at last
From shining floor to rafter;
Now glittering in the silver store
Of heirlooms with a story,
Now weaving saintly halos for
The elder's crown of glory;
But tenderest the fire-light glows,
And merriest is glancing
Upon a boy with cheek of rose,
In baby frolic dancing
About a loving father's knee,
Whose brow of care unbending
To join in all the baby glee
Is father's fondness lending;
While, with her loving smile for all,
The gentle household mother
Moves queenly through her kingdom small,
Nor longs for any other,
But muses, in a happy way,
Whether on earth there may be
Another such papa to play
Bo-peep with such a baby.
Full well the picture I recall
My childish fancy greeted,
And which the scene that most of all
I liked to have repeated:
How, when his father's hiding-place
The boy could not discover,
A while he stood with puzzled face
Thinking the matter over,
Then stooped with sudden roguery
And airs of mock confiding,
And peeped beneath a chip to see
If there papa was hiding;
And how the trick brought papa out
With sudden peal of laughter,
And joyous was the baby's shout,
And wild the frolic after.

And still my fancy lingers in
The pretty, childish story,
And thinks a deeper sense to win,
As from an allegory;
For what do we with childish wits—
More witless children rather—
Seeking beneath our chips and bits
Of truth to find the Father—
"Lo here, lo there"—when every where
His walls of home do hold us,
The warmth and love-light of His care
By day and night infold us?
And when we lay us down to sleep,
And scenes of earth forsake us,
His presence still our souls shall keep,
His morning kiss shall wake us.
Does not the Father's pity yearn
To comfort them that fear Him,
Until within His arms they learn
That they are always near Him?

FLOATING ISLANDS IN THE ARARY RIVER.

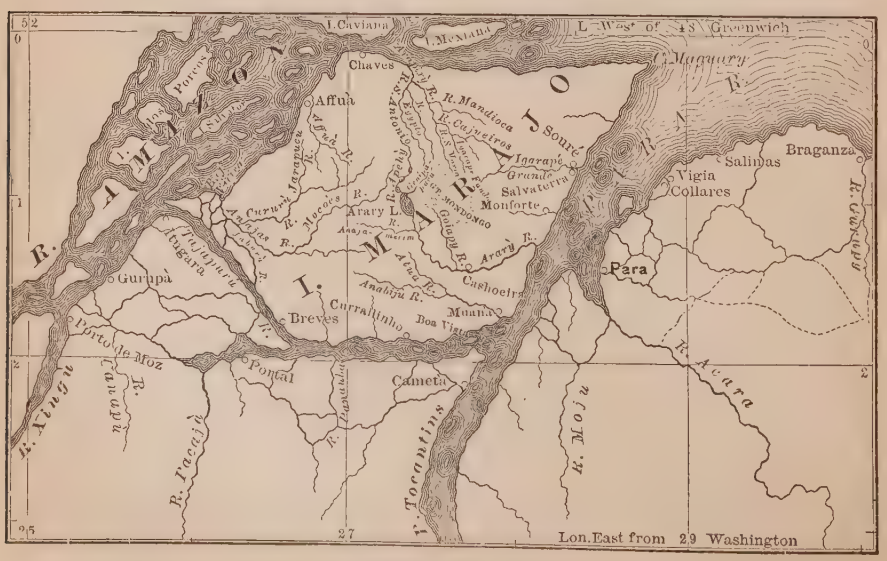
AT THE MOUTH OF THE AMAZONS.

I.—ISLE OF MARAJÓ.

DURING the last twenty-five years much has been written concerning the valley of the Amazons. Wallace, Bates, Agassiz, Orton, and many other scientific men of note have spent years there, without seeing, however, more than a small portion of that world of water and verdure. For a long time to come these regions will be still new, and each fresh traveller's experiences will bear the character of novelty.

Knowing that all the great rivers of the world—the Mississippi, the Ganges, the Danube, the Nile, and others—open into the ocean by immense deltas, geographers and naturalists, though wondering that the greatest river of them all, the Amazons, should form an exception, have agreed to accept the conclusion that the fresh-water king has no delta. After many an excursion through the immense archipelago which obstructs the opening of the Amazons I have come to quite a different conclusion.

Professor Agassiz considered the island of Marajó as originally a continuation of the valley of the Amazons, believing he recognized in it the geological structure of the latter in all its details. He supposed that the island of Marajó had been, at some date, "an integral part of the glacial deposits that formed the whole valley," and at a later period became an island in the bed of the river, which, dividing into two arms, encircled it completely; and then, joining again in a single stream, flowed onward to the seashore, "which in those days lay much farther to the eastward than it now does." Strange as it may seem, Professor Agassiz, while maintaining that "the sea is eating away the land much faster than the river can build it up," ignored the possibility that this delta, the asserted absence of which so sorely puzzles geographers, might have been washed away in great part, and that the immense archipelago at the opening of the Amazons should be considered as the remains thereof. Old canals and swamps have been filling and new ones forming every day. In the wet season the islands, however numerous they may have previously been, are divided into many smaller ones by a network of channels tenfold more complex than during the dry season. They have an alluvial formation. The reticulation of the Amazonian delta is not circumscribed by the two main branches of the river—that is, by the Amazons proper and the Pará River—but by means of rivers, lakes, streamlets, and channels it extends from the mouth of the river Xingu as far down the southeastern coast of Brazil as Maranham. The northern part of the province of Pará, during the wet season, is naught but a vast swamp intersected by channels more numerous than those which reticulate the delta of the Nile. Two boats were dispatched to Salinas last March from the steamer *Richmond* in search of a pilot. They were missing several days, and at last given up as wrecked among the breakers of the dreadful Salinas Bay; but later on they made their appearance at Pará, after rowing many



days overland among luxuriant submerged forests, and through creeks and lakes which for countless miles netted the province, and finally communicated with the Pará River.

Marajó is the largest island of South America, and is situated between the Amazons and the Atlantic Ocean. Shaped somewhat like a lozenge from which a corner has been broken away, it is separated from the continent by several natural channels, through which the waters of the Amazons expand themselves before forming the southern branch of the river. The northern coast of the island runs nearly parallel to the equatorial line, from which it is at some points only seven miles distant. From Maguary Point, the eastern extremity of the northern coast, to the mouth of the Cajuùna—a canal marking its western boundary line—Marajó extends about 150 geographical miles, its greatest width from north to south being always below 100 miles. On the white sands of Maguary a ceaseless strife is waged between the green waves of the ocean and the yellow current of the river. At high tide the point stands but a few lines above the water-level, at every instant seemingly about to be submerged, but in reality never covered. A nearly diagonal line drawn from northwest to southeast in front of the ocean-like expanse of the mouth of the Tocantins divides the island into two nearly equivalent sections, the southwestern being covered with woods, and called *mattas*, while the northeastern is an endless prairie (*campos*), relieved at rare intervals by groves of trees. The former is of extraordinary fertility even for a tropical country; it yields nearly every variety of wood known in Northern Brazil. The India rubber tree grows so plentifully that this section has been styled the El Dorado of the India rubber collector.

Low as the *campos* and *mattas* are, there are in the island tracts of marshy ground whose level is lower than that of the river. It appears that these were formerly lakes and streamlets which in the course of time became filled with an overgrowth of marshy plants and water sediments caught in their meshes. These swamps are generally called *baixas* (low lands). Some of these (called *mondongos*) are from fifteen to twenty miles in circumference, and abound in myriads of reptiles, electric eels, and leeches, which render approach to those solitudes the more dangerous as they are recognized with difficulty by any one not a native.

When the rainy season begins, the baixas naturally fill up with rain; a flood spreads far and wide through the land until outlets are reached in some of the lakes and rivers of the island. The lake Arary, almost in the centre of the island, in the prairie region, is most noteworthy. If a morning excursion on the lake is delightful, the evening stroll on the beach is no less so, when the water is dyed with the purple sunset, and the quiet of the scenery is broken here and there by a fire along the shore, casting into dark relief the figures of Indians cooking their supper.

The average width of the lake varies from two to two and a half miles, and its length from north to south, exclusive of the numerous ramifications formed by the river Apehy, is almost ten miles. During the wet season —from November to June—the lake contains from fifteen to twenty feet of clear and very palatable water; but in summer its waters fall as low as seven, and even four

THE MOUTHS OF THE AMAZONS.

feet, and being continually stirred to their lowest depths by trade-winds, they become muddy, and assume a leaden color and a disagreeable saline taste.

The most important river in the island is also called the Arary. Starting from the southern extremity of the lake, and describing countless sinuosities, it takes a southeasterly direction across the prairies, and offers some lovely bits of landscape to any tourist whose poetic feeling is not too easily subdued by apparent monotony, and who is able to detect the variety with which nature ever clothes its works, however resembling one another in general outlines. Below the village of Cashoeira the Arary becomes narrower, darker, and drearier; in some places, during several months in the year, the sea-grass and wild cane often grow so thick in the bed and along the banks as to obstruct the passage of boats. It was only by using our wood-knives, or *terçados*, as they are called by Brazilians, after the same fashion as in my excursions through the Amazonian forests, that our boat was made to take its way up to the village. After turning the baixa of Moirin, however, and assuming an easterly course, the Arary widens considerably, its surroundings become more pleasant, its waters grow clearer, its banks become rocky and higher, and finally, after passing through farms, sugar-cane and cocoa plantations, and changing its course to southeast by south, it discharges itself into the Marajó Bay (another name for the Pará River), leaving to its right the important island of Santa Anna do Arary.

Having alluded to the *fazendas* along the banks of the Arary, I can not forbear mentioning the most extensive and important of them all, namely, the National Fazenda do Arary. It covers nearly two thousand square miles. Administrative mismanagement, absence of intelligent direction, horse and cattle stealing, organized on the widest scale throughout the cattle-raising portion of the island, the epizooty that has ravaged the country for many years, the yearly floods —these and other causes combine to render this farm, which might form elsewhere the wealth of a government, a burden to the state. The farm-house, now the dwelling of the superintendent, is situated in a most picturesque spot. It was built by missionaries some time during the last century, and is located on a table-land which surmounts the highest floods. The house is two-storied, capacious, and solidly built, although bearing externally the marks of its great age. Its accommodations are good, and a veranda runs around three of its sides. The plentiful hooks for hammocks affixed to the walls and supports of this veranda called up visions of the many naps and swings enjoyed, with the cooling trade-winds, by the easy-going monks of older times, and the vast pigeon and hen coops near at hand told similarly of the good cheer to which they were not impartial. At the time of my visit I found the cellar beneath the house filled with water; but whether the worthy ecclesiastics of yore had it built for that or some other purpose is an open question. On the right of the farm still remain the ruins of the exterior walls of a chapel, half hiding the riot of wild vegetation within. And here another little problem presented itself to my mind: what reason was I to assign for the fact that those devout monks built their own dwelling so much more enduring

ENTANGLED IN THE SEA-GRASS ON THE ARARY RIVER.

THE MONTARIA, OR WINTER WAGON OF MARAJÓ.

than that of their God? Further to the right stand the ranch-houses, sixteen in number, and constructed of wet clay and wooden frames. There lived the slaves employed by the missionaries. During a certain period of the wet season the Arary offers a singular phenomenon to the eyes of the traveller: its waters run in opposite directions; the lower part of the river runs down to the bay, while the upper part flows sluggishly backward and throws itself into the lake, to resume its natural course when the latter has attained its maximum depth.

I have called attention to the fact that the Arary was sometimes closed to navigation by the overgrowth of the sea-grass or wild cane. The navigation of many of the rivers in the island is impeded by the same hinderance, though locomotion is not wholly stopped in this way. Be these plants hewn away by the hand of man or carried off by the currents, they gather again in thick-matted floating islands, and not rarely arrest the progress of a steamer until her wheels and bow are cleared from their entanglement. The denseness of these floating islands, or *barrancos*, is sometimes astonishing. While exploring the Tartarugas River I have seen half a dozen cows race wildly over a barranco as upon dry land, moving with it down the river, without at all disturbing its compactness.

Next to the Arary in length and importance is the Anajas, whose manner of formation is clearly shown by the map. Broad and deep, this river affords no obstacle to navigation for over half its course, and is very picturesque, with its luxuriant forest emerging from the river edges, and especially so in the tract where the village of Anajas arises at the junction of two tributaries of the river.

The temperature, as a matter of course, is very high throughout the island, the heat being, however, stronger in the forests of the west than in the prairies of the east, as an impenetrable screen of foliage neutralizes in the former the beneficial action of the sea winds. It is the privilege of the woodland, particularly of the Ingapos, where the India rubber collector is most frequently found, to be the native land of the intermittent fever.

Here man, literally buried in lakes of verdure, breathing only the pestilential exhalations of decomposing vegetation and stagnant water, must be said to perish slowly rather than live, his mode of living hastening nature's destructive work. The fish upon which he feeds, the *cachaça* (Brazilian whiskey) he must drink to check artificially the action of the deleterious elements absorbed by his constitution and to give his system a fleeting strength, do not constitute the healthiest *régime*. Nor is his dwelling at all calculated to add to his physical improvement. Too indolent to prepare comfortable lodgings for himself when he knows that he is to live in the place only a part of the year, he hardly builds up a shed sufficient to shelter him from the rain. I have seen hundreds of "siringueiros" who had no other dwelling than their mosquito-net under a small thatched roof of palm leaves, and even some whose sole protection against the rain and the dreadful dampness of the night was a few banana leaves spread on the top of the net. The mosquito-net of the Indian is not of the filmy consistency known to most of our readers. Brazilian insects are not so easily mitigated as their comparatively civilized brethren of the North; those of Marajó particularly are very bold, and for them a net of thick, impervious cloth is requisite, offering no opening to their intrusiveness. For this purpose the net usually falls upon a mat of hide stretched on the ground beneath, and is provided with sleeves for the ropes of the hammock, about which the former are always tightly fastened.

Although at present the India rubber forms the wealth of Northern Brazil, it will be soon found that no real improvement is possible without a clearing of the land—an operation seriously inconsistent with the culture of the tree. The intermittent fever destroys more than half the number of the workers. Only a few can endure the climate for five or six seasons. The natives are fully aware of this, but as the labor is the lightest and most remunerative, the majority confront all dangers, and continue to collect it, unmindful of every thing save the prospect of idleness during one-half of the year. Agriculture and the really civilizing industries are neglected; ignorance, indolence, and misery prevail even in those villages which possessed the most promising outlook before the India rubber trade had entirely supplanted the culture of the sugar-cane, coffee, cocoa, cotton, mandioca, and Indian corn.

AFFUA, ON THE WEST COAST, ISLAND OF MARAJÓ.

Life on the prairies is comparatively healthier and more enjoyable. There one can easily detect upon the countenances of the inhabitants the healthful work of the sea-breezes. Fevers are not uncommon even in this section of the country during the months of November and December, but they are not productive of such deadly effects as those of the woodland. No country in the world changes so much its aspect as this section of Marajó as seasons succeed to one another. The prairies look most delightful in the earliest part of summer, when vegetation is in its glory, when herons, ducks, and ciganas are plentiful on the

SOURÉ AND SALVATERRA.

grass, and flocks of minor birds, with their gorgeous plumage glittering in the sun, fill the air with music and motion, while from the reedy grasses comes mysteriously the deep note of the unicorn,* so greatly praised in Brazil, and so seldom to be seen; and horses are galloping around and cows quietly pasturing among water-lilies—not delicate, small plants growing timidly among mosses and ferns, but giant flowers with leaves four or five feet in diameter. When summer draws to a close, the prairie assumes other forms. The graminaceas upon which the cattle feed become withered and die; the clayey soil, parched by the violent heat, breaks into huge yawning, irregular cracks, and the whole scene is transformed into a wild desert. The dry grass is set on fire, and, the winds having greatly diminished, a dense cloud of smoke hangs over this part of the island, through which the sun appears as if seen through a smoked glass. It is at this time that the cattle-raisers and their *vaqueiros* are seen galloping from farm to farm over the endless plains, their pace scarcely interrupted by the terrible swamps, for the purpose of collecting and branding their herds of cattle —an arduous work, but, owing to the great number of people it brings together, it assumes the character of a rural festival, by no means the least noisy in Brazil. Well-nigh exhausted by the hardships of the day, they seek at night recuperation in dancing and wild merriment. Their favorite dance is the quadrille, but they throw into it so much of their characteristic movements that it loses its conventional aspect, and in the eyes of a foreigner assumes the odd form of a wild national orgy, the pipes in the mouths of the female dancers strongly intensifying the grotesqueness of the scene.

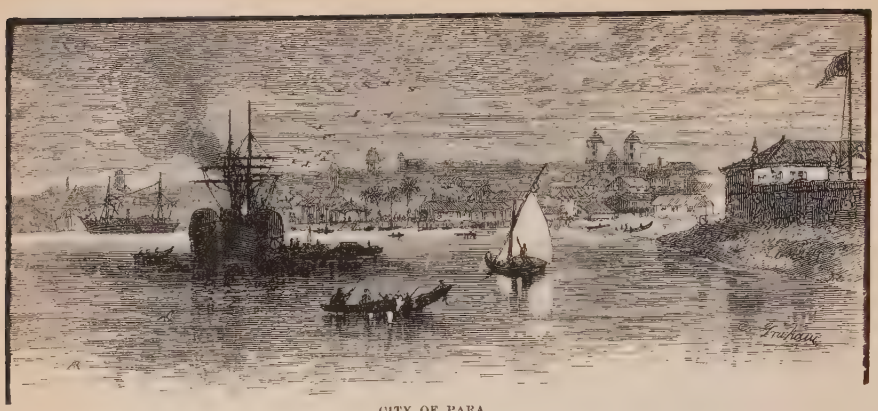
When the flood season comes, only the higher portions of the island, termed *tezos*, are dry. "The island of San Juan" (as Marajó was formerly called), wrote the worthy engineer Simões de Carvalho in 1799, "is an immense pot of water for one half of the year; for the other half, an immense pot of verdure." At the time of my second visit, although the flood had not been very great that year, the prairies were a great lake, from which here and there emerged an island-like strip of land covered with grass or groves of trees. I saw canoes move above these fields over which a few months before I had seen vaqueiros gallop, and enormous fishes dart where mammalia had pastured heretofore. Where the waters were low I saw *montarias** attached to the tails of oxen, and driven exactly as one would a cart.

As stated above, cattle-raising is one of the main industries of the island. This industry was introduced by the farmer Francisco Rodriguez Pereira. The missionaries extended the industry, and toward the end of the eighteenth century cows and oxen were reckoned at 500,000 head, and horses at twice that number. This enormous multiplication of the species soon engendered proportionate evils. The horses became almost wild, and so ravaged the prairies as

* The unicorn is "a large bird, half wader, half fowl, belonging to the genus *Palamedea*."—Agassiz.

* An Indian canoe having a cabin covered by a thatched roof of palm leaves.

not to leave sufficient food for the cattle, the latter being ultimately forced to betake themselves to the swamps, where they perished in enormous numbers from their inability to extricate themselves from the mud. Fifty years ago the farmers of Marajó applied to the government for radical measures against this multitude of wild horses. They are now obliged to seek governmental assistance to preserve the race, and have to pay for a horse sixty times over.



In 1825, just when the farmers' complaints were most pressing upon the government, an Englishman begged leave of the President of the province to buy and kill 50,000 horses, with the object of exporting their hides and manes. License being readily granted, he bought them at from five to seventeen cents apiece. The example was followed by other English and French speculators, all of whom retired rich from the traffic, and with the title of benefactors of the island of Marajó. Meanwhile, as the contractors were not held by any condition to bury the carcasses of the slaughtered animals, these remained for a long time on the prairies, and, putrefying rapidly, caused the atmosphere to become so vitiated as to forbid approach to the locality. A terrible epizooty was the natural consequence of this reckless procedure, the efforts of the cattle-raisers and of the provincial and general governments proving alike unavailing against the disease for over forty years. Nor has it yet wholly disappeared.

The floods, too, destroy the cattle by thousands yearly. People who at the opening of the wet season owned 2000 head found sometimes that their stock had been reduced to 300 at its close. What the Brazilian government does to improve the condition of the island and avert the evil, beyond sending engineers to study the important problem, it would be difficult to say; but I fear a long time will elapse before any decided progress is made.

The population of the island is estimated at 36,000, and it is divided into three counties (*comarcas*), which are subdivided into five districts (*termos*), the latter embracing eight villages, to each of which is given the pompous title of *villa*, or city. Chaves, a village on the northern coast, commands an extensive view of the Amazons, the large

CHAVES, ON THE NORTH COAST.

CITY OF PARA.

island of Caviana, and, toward the northeast, of the canal which divides the latter from the island of Mexiana. The village is formed by two squares and by two roads, which are cut at right angles by two smaller ones. The population does not exceed 300 in number. There are two primary schools, attended by eighteen male and twelve female children. A division of the sexes is deemed necessary; hence the number of schools in the island—thirty for 400 pupils. A vessel of the Amazons Steam Navigation Company, under government contract, places this village in monthly communication with Pará. Deprived by nature of any harbor, and entirely exposed to currents and winds, approach to Chaves is often dangerous and always difficult for boats of any size. Chaves might be termed a nomadic city, as it has more than once changed its situation, retiring each time further inland. The police head-quarters were formerly established at the point where now the steamers of the company drop anchor. An old church used to stand 240 yards out in the river, so large a portion of the shore having been here detached by the Amazons within the last century. Some detached portions of the coast and some ruins of private houses still exist on the river-edge, which bear witness to the growing sway of the currents at this point during the last twenty-five years.

Salvaterra and Souré, shown in another illustration, deserve mention. The former is built on the right bank of the Igarapé Grande at its opening into the Pará River, the latter on the left bank a short distance above. From Salvaterra, Souré may be seen, rising on a rocky strip of land, comparatively high above the prairie and the windings of the stream—altogether a charming bit of landscape. These are cool spots, too, and command a magnificent view of the river Pará. So much sea-water is brought by the tide to the Igarapé Grande that from August to January Souré and Salvaterra are abundantly frequented as watering-places by the Paranese, and would be still more so if they offered less meagre accommodations to visitors.

With the exception of Anajas, Cashoeira is the only village in the interior of the island. It is situated on the prairies along the left bank of the Arary, twenty-two miles above its mouth. It is a neat and well-built village, although not picturesque. The main trade of Cashoeira, like that of Souré, is the exportation of cattle—to the extent of 10,000 head per annum. Cotton, rice, mandioca, cocoa, and other commodities are also produced, but in quantities insufficient for the needs of the place, despite the fact that the soil is of the richest nature, and particularly adapted to all kinds of agricultural produce. Five or six square miles of this land in the hands of one or two hundred Americans would yield enough farinha de mandioca—the Brazilian bread—to feed all the inhabitants of the two provinces of Pará and Amazonas.

II.—THE CITY OF PARÁ.

Although the city of Pará is but seventy miles distant from the mouth of the Amazons, and the breadth of the Pará River varies from thirty-six to twenty miles, it is by no means an easy matter for vessels unacquainted with the locality to make their way up the great river to that city. Owing to the ceaseless alterations in the sea and river bottom—the work of the contending currents of the two elements—it is suggested by all books of "Instructions for Navigators along the Brazilian Coasts," that captains bound for Pará should anchor in front of the light-house at Atalaia Point, in not less than eight fathoms of water, and signal for a pilot, who is supposed to exist in Salinas Bay, near Atalaia, and the only port of entry to the vast regions watered by the Amazons. To secure a pilot at Salinas is, if less dangerous, even a more uncertain undertaking than to approach the coast. The light-

house is uninhabited, save when the keeper proceeds thither in the evening to light its mysterious lamp. This personage does not even own marine glasses, and is commonly unprovided with the means of making signals, which, as a matter of course, are of a wholly esoteric nature. Usually he pays no heed whatever to the messages of anxiously waiting vessels. There is often a pilot at Salinas, in which case the absence of a suitable boat is an absolute certainty; or, if the boat is convenient, a pilot can not be found. When the Emperor of Brazil, on his way to Pará, passed, some four years ago, near Atalaia, he was delayed two days before a pilot made his appearance.

The Pará River, though only a branch of the Amazons, first strikes the traveller with efficiency in the past, is now about as redoubtable for warlike purposes as a pasteboard castle would be. Nevertheless, all vessels intending to sail up the Amazons are expected to exchange salutes, and ask from this rheumatic old Gibraltar permission to proceed further.

The appearance of Pará from the harbor is in the highest degree pleasing. The numerous spires, towers, and cupolas of the churches, the lofty palatial edifices of the government, the red-tiled roofs, and finally the white façade of the tall row of buildings separated from the river by a line of cocoanut palms with bulbous stems, low-drooping clusters of heavy fruit, and plume-like hanging flowers, and beyond the city one wide and towering forest, while the wharf re-

GOVERNMENT PALACE.

a sense of its immensity. Both of its banks are never seen in one view. A great number of islands, veritable "summer isles of Eden," contract the view, and only a narrow blue line far to the right is all that is at times visible of the island of Marajó. The islands multiply as one nears Pará, and are more and more enlivened by the vision of pretty cottages nestled in foliage, and factories that wear so little of our Northern aspect of brick and toil and smoke that they, too, harmonize with their environment of bright trees and glorious flowers. As if to bring to memory the old wars, and the monopolies that were not less baneful to the improvement of the empire, when the Amazons was closed by Portuguese greediness against foreign navigation, there stands on a rock lying in the river-bed an ancient fort of circular shape, which, whatever its sounds with the noise of a crowd of Indians, negroes, and whites, and the harbor swarms with canoes, launches, and steamers—all this presents a most picturesque view. In no other locality, perhaps, are civilization and barbarism contrasted with so strong and agreeable effect. The houses in the commercial quarter of the city are usually two-storied, plastered, and whitewashed, or painted red, yellow, or blue; not a few are faced with variously tinted porcelain tiles. Balconies and glass windows abound; but the old lattice casements are retained in the poorer quarters. If we except some of the business thoroughfares, the streets of Pará are generally unpaved; one literally wades through loose sand, which, after a rain-storm, is gullied into innumerable rivulets that render locomotion any thing but pleasant. The keeping of a seat in a vehicle is a mat-

RUA DE SAN JOSÉ.

ter requiring considerable gymnastic ability. Of the forty thousand inhabitants of Pará, there is only one person who indulges in the luxury of a private carriage, despite the fact that the Paranese are as fond of driving as the Parisians, and the public drivers do an excellent business.

If the old part of the city offers no greater attraction to the tourist than any ordinary town, it must be acknowledged that the new portion is very beautiful. The Rua de Nazareth (Nazareth Avenue), which, at the time when Bates, Wallace, and Agassiz undertook their journeys up the Amazons, was only a suburban road embellished at rare intervals by country-seats, is now lined for nearly two miles with pretty residences one or two stories high, with spacious verandas, and surrounded by majestic natural parks or elegant little gardens, and has become the aristocratic quarter of Pará. The air along the avenue is heavy with perfume of orange and lemon trees and other rich tropical fruits, and the sidewalks are edged with magnificent silk-cotton trees—huge trees whose trunks taper rapidly from the ground upward, to radiate again into a thick foliage of perpetual green, ample enough to completely shade the street from walk to walk, and whose flowers, before opening, look like "red balls studding the branches." The streets closely adjacent to the Rua de Nazareth are hardly less beautiful, and are similarly ornamented by stately rows of almond, silk-cotton, and cocoa-nut trees.

A PARANESE BELLE.

The Rua de Nazareth has a tramway running direct to Marco da Legua, a suburb about five miles distant. At this point the land slopes into a marshy hollow, in which are situated the public wells. Here innumerable noisy negresses wash the linen of the city, and here are filled painted hogsheads on wheels and drawn by bullocks. In the early morning this locality is full of activity. Negroes and *Gallegos*,* vociferating and wrangling, fill the lanes and alleys with their water-carts, and assemble for morning

* *Gallegos* is a name by which the Portuguese contemptuously call the Spaniards from Galicia, who migrate to Portugal and pursue the calling of water-carriers. Brazilians avenge the Spaniards by applying the same name to the Portuguese, and no less contempt is attached thereto.

drams in unwashed taverns at street corners. The other extremity of the tramway connects with the business part of the city, and the crowded cars, at the hours when people go to or return from their stores and offices, remind one for a moment of our busy American cities—for a moment, I say, for the horse is replaced by his outcast relative the mule, and the illusion is quickly destroyed.

The inhabited portion of the avenue is bisected by the Largo de Nazareth, or Nazareth Square, which is a misnomer, as the reservation is circular. Here are located the church and chapel devoted to the worship of Our Lady of Nazareth. Skin diseases are extraordinarily prevalent on the Amazons, the warm, moist atmosphere often retarding the healing of wounds and sores, and converting them into serious matters. A beggar in receiving alms will express his gratitude by wishing that "Our Lady of Nazareth may protect you from all sores;" and it is customary with the lower classes, when in fits of passion, to give vent most emphatically to wishes of very different character. A panacea for all such afflictions was at length discovered by some ecclesiastical wiseacre in the image of Our Lady of Nazareth. The church and chapel just mentioned became in this way a shrine of highly vaunted efficacy, and every Wednesday sufferers from every quarter resort thither to hear mass and have prayers offered for relief. The chapel walls are abundantly decorated with offerings that have been made to Our Lady of Nazareth—proofs of the miracles which she has performed. They are painted models of heads and limbs, in wood or wax, purporting to have been the afflicted members of persons cured by this miraculous agency. In this way the sacred edifice has degenerated into an anatomical museum.

In October occurs the feast of Our Lady of Nazareth. From all places up the Amazons people pour down to Pará on that occasion. For two weeks Nazareth Square becomes nightly ablaze with lights and fireworks, and is metamorphosed into a ballroom, in which a crowd of inhabitants whirl in the most maddening dances.

A BRAZILIAN SENHORA.

It is difficult to imagine any thing more monotonous than the life of the Brazilian "senhoras." Wherever the old Portuguese ideas of propriety still prevail the lives of women are colorless as those of cloistered nuns, and without the relief of the religious enthusiasm. Many a lady passes her life day after day without stirring from the four walls of her house, either motionless in her hammock, or staring through her window-bars at passers-by. She is never seen in the street save when on her way to the theatre or to church, and in these cases always with a male chaperon, certainly a member of her family. She seldom receives calls, and consequently her in-door attire is a slatternly dishabille. It is sad to contemplate these stifled existences: without contact with the outer world, without the charm of domestic life, without books or culture of any kind, the Northern Brazilian woman shortly becomes as discontented as she is useless.

The men of the Amazons are, as a rule, illiterate, and imbued with all the prejudices and self-conceit of ignorance. They can see nothing beyond their stage of civil

NAZARETH SQUARE.

development; indeed, they boast that their country in beauty, culture, and progress surpasses any in the world. They are distinguished for mental indolence. To most of them all flowers are "flores," as Mrs. Agassiz well remarked, and all animals, from the fly to the tapir, are "bixos" (animals). So very vague were the replies made to my inquiries for the common names of insects and birds, that I was obliged to renounce the idea of adding the national to the scientific classification of my collections. In one thing, at least, are Brazilians in advance of other nations which boast of greater civilization, namely, in their actual acknowledgment of the equality of races. There is absolutely no distinction of color made in Brazil; a negro, supposing him to be free, is treated with as much consideration as any white man of his standing, and a black lady meets with as respectful recognition as a white one.

Be what may its beauty, when measured by the standard of Northern architecture, the prevailing style in private dwellings at Pará is well adapted to the needs of the people and the exigencies of the climate. The rooms are large, with high ceilings, and well ventilated. The furniture is generally of the simplest kind, the ornamental part thereof consisting chiefly of old mirrors, chandeliers, and huge vases of artificial flowers under glass covers. The arrangement of a sitting-room or parlor deserves particular notice, as it is unlike any thing found elsewhere. There are often more chairs in it than in a whole American house; they not only line the walls, but are also disposed in two rows half-way across the floor, at right angles with the sofa, as though Brazilians intended to create a small cozy room within the large one. Whenever the notable character of his visitors compels the host to abandon his hammock, the reception takes place within this inclosure, the owner of the house naturally reserving for himself the place of honor—the sofa. It is amusing to regard the ostentatious formalities that attend these visits of ceremony. The conversation is carried on in a subdued, frigid, but extravagantly polite manner, no motion of any kind being indulged in by the participants, and the position *de rigueur* being that of sitting mummies. Fortunate-

ly foreigners are not bound by the same code of etiquette, and it must be said that Brazilians welcome them cheerfully, and will do any thing in their power to make them feel at home.

Among the public buildings at Pará the Government Palace, the Portuguese Hospital, and the Theatre of Nostra Senhora da Paz (Our Lady of the Peace) are the most remarkable. The marble staircase and vestibule of the government building are especially a work of art. The Portuguese Hospital is a most imposing building, and seen from a distance its whitewashed walls in the glittering sun seem to be of the whitest

MARKET, PARA.

Parian marble. It is difficult to imagine an edifice more appropriate for the purpose to which it is devoted. Every thing bears witness to the cleanliness, cheerfulness, and order of the establishment. Some of the public rooms are very handsome, especially the eastern one, where there is a statue of King Louis of Portugal, and the western one, at the end of which hangs a magnificent full-length portrait of Emperor Dom Pedro II. The upper floor of the central building is occupied by a spacious lecture-room and rooms for the doctors' accommodation. One of the great features of this hospital is a well-selected library for the amusement of the inmates. This hospital was lately erected, chiefly at the expense of the pious brother of the Portuguese king, and is supported by contributions from the Portuguese colony of the city.

The Theatre of Our Lady of the Peace is undoubtedly the largest and finest building of its kind on this side of the Atlantic. The religious name given to the edifice, if it bears witness to the bigotry of the city, bespeaks also its patriotism, as it was erected at the close of the Paraguayan war, and in commemoration of the peace signed between Brazil and Paraguay. The exterior architecture is of the handsome Tuscan order, with alcoves on three sides, which are supported by beautiful marble colonnades. The interior is also in the style of Italian theatres, which may be briefly described as a series of private boxes disposed in five or six stories, one above the other, and which well replace the clumsy galleries of our theatres. And a magnificent sight it affords when the immense room is ablaze with countless lights, revealing the gorgeous dresses, jewels, glossy raven hair, and sparkling eyes of the Brazilian ladies peeping forth from their boxes all around. Between the acts of the performance it is the custom of ladies and gentlemen to leave their boxes and promenade in the alcoves, which are also profusely illuminated, and communicate with one another by means of a vast ball-room occupying the whole front of the building. All these figures of ladies dressed at their best, and passing to and fro in the glow of a thousand gas-lights, chatting, laughing, courting, and coquetting—in short, making the best of their few moments of freedom —while on the dark square below the immediate vicinity of the building is thronged with women of the lower classes in their neat white garments, afford a panorama of which no idea can be conveyed by words.

THEATRE OF OUR LADY OF THE PEACE.

Another picturesque view of life at Pará is shown at the market early in the morning. The market is a large building one story high, with an unroofed square in the centre, which is occupied by the stands for fish and meat. The corridor running around this space is lined on both sides by stalls, in which are disposed with artistic disorder fresh loads of bananas, oranges, and all tropical fruits; baskets of vegetables and flowers, trays of sweetmeats, rolls of tobacco, and bunches of pipes; pitchers of lemonade, plates of fried fish, chickens, parrots, monkeys—every thing. The crowd for a few hours is so great as to render progress almost impossible. It was a new pleasure to me to watch the picturesque negro groups selling their wares or sitting about gossiping, and the old Indian women, who, indifferent to every thing around, even to the selling of their vegetables, were smoking their long, straight-stemmed pipes. The negroes on the Amazons, although not such a fine-looking athletic race as those of the southern provinces of Brazil, are by far more powerful and handsomer types than we are wont to see in North America. The women especially are finely made, and have quite a dignified presence.

Santa Maria do Belem do Gram Pará—this being the full name of the city commonly called Pará—was founded in 1615, the year that saw the death of Shakspeare, by Francisco Caldeira, who was commissioned by the general government of Brazil to build a fort at the mouth of the Amazons, in order to close the river to foreigners, who had commenced trading with the Indians. Although indolent and seemingly unmindful of every turn of affairs, Pará has been more than once the scene of dreadful events. Almost from the year of foundation it has been the battle-ground of military and monastic factions, which have abandoned themselves to every species of disorder and retaliation. The unhappy natives were dealt with most cruelly by the highest office-holders under the Portuguese *régime*, the Jesuits having always advocated the slavery of the Indians. Hatred naturally having been aroused, the Indians, whenever opportunity offered, halted at nothing to satisfy their desire for revenge.

When independence was proclaimed in the province of Pará, the Portuguese authorities intended to hold the capital, but on the summons of the English Captain Grenfell, Lord Cochrane's lieutenant, the city was given up to a municipal commission, and the government of Dom Pedro I. was regularly installed. Surprised rather than vanquished, the Portuguese soon attempted what proved an unsuccessful insurrection. A great number of the rebels fell into the hands of the government; five of their leaders were shot, and 250 of the most prominent actors were imprisoned in a ship lying in the harbor. Packed in a hole in which they could scarcely breathe, nearly dying of thirst, the wretches attempted to gain the deck, but were driven back into the hole by the deadly fire of the Brazilian soldiers, who, to prevent further disturbance, nailed up even the windows by which the rebels received the little quantity of air that kept them alive. A number of these wretched beings perished from asphyxiation; others, attacked by madness, devoured one another after the fashion of wild beasts. During the whole night their desperate cries filled the air; then the noise gradually diminished, until the silence of death followed. On the morrow, when the windows were opened, it was found that only four, who had hidden behind some barrels, had survived.

The last great revolution of Pará occurred in 1835. On January 7 of that year, the guard of the palace having rebelled, the President of the province, the commander of the fort, and the captain of the port, as well as about thirty Portuguese residents of the city, were slaughtered. A well-known patriot, the worthy Felix Antonio Malcher, was taken from the prison where he had been secluded for a long time as having been the leader of the insurrection of Acará, and was declared President, after stipulating that he should obey no order from the general government until Dom Pedro II. was of age. Hardly had order been re-established when Pedro Vinagre, the newly appointed commander of the military force in the city, learning that he was to be arrested for a crime he had committed, aroused the majority of his men and the vilest crowds of the city against the President, and another insurrection commenced. The government palace was taken by storm. Malcher was taken, after losing about two hundred men. He was court-martialed, and sentenced to imprisonment for life in the Fort da Barra, but he was slaughtered on his way thither, as no one doubted by Vinagre's secret order. Popular instability rewarded the murderer by electing him to the Presidency.

The government, determined to quell the insurrection, dispatched Senhor Corrèa with thirteen men-of-war, with injunction to seize the city at any cost; but the thirteen men-of-war were sunk by the batteries of the then formidable fort. On June 24, 250 soldiers, under the leadership of the new President, succeeded in forcing the rebels to retire. Disorder continued, however, to reign over the province, and on August 14 a body of Indians, led by Vinagre, fell unexpectedly upon Pará, and took it by storm. The slaughter of the whites commenced anew, only a few foreign families escaping by taking refuge on the English and French vessels stationed in the harbor. This period may well be styled the "reign of terror," dissension among the rebels themselves having doubled the carnage. This state of things lasted until January following, when General Andrea opened his way to the capital of the province by force of arms. Martial law was proclaimed, and by this man's energy and severity the rebellion was brought to an end. General Andrea has been accused of tyranny and inhumanity. Perhaps he overstepped the limits of justice. It should be borne in mind, however, how difficult, if not dangerous, moderation becomes on certain occasions. Better grounded is the charge of his having lengthened the civil war for the purpose of enriching himself. This policy was, at all events, but the continuation of the rapacious one instituted by the Portuguese.

The city and province of Pará still bleed from these wounds. Although the country has witnessed no further disturbance, agriculture and trade are still paralyzed. The ill government of the conservatives has checked the development of both city and province. During the last fourteen years, when they had control over state affairs, Pará has had nine Tweeds who have freely plundered the provincial treasury, one of them finally setting fire to the archives to destroy the proofs of his crimes, as well as those of his predecessors and confederates. Five or six years ago a high dignitary of the Church at Pará, who also held the office of Vice-President, obtained for his brother, a druggist, a contract to supply the city with quinine for the relief of the large number of poor people who were afflicted with intermittent fever. The druggist's bill represented ten times the amount devoted yearly to this purpose, though the disease had not circulated more widely than usual. The provincial government of Pará is now in the hands of honest, intelligent people, and though the treasury is empty, the city can not fail to greatly improve. Whoever shall write in ten years about the subject will doubtless have to register great changes both as regards the material and the intellectual life of the city. The Queen of the Amazons has such a splendid future before itself as few cities in the world, however favored by nature, will ever have.

MOONSHINERS.

ON an August evening Mr. John Norcross, fisherman and gentleman of leisure, was scrambling along the steep banks of a small tributary of New River, in Western Virginia—lost. The sun was just setting, and he had not the least idea of the road home. He knew the general direction, for the range of the mountains told him that. But a path was the mystery. The situation was unpromising. It was a hazy evening, and the sun, which resembled a red-hot cannon-ball suited to a gun of thirteen-inch calibre, was just balanced on the tops of a dense fringe of pines; night was coming fast, and the fisherman—you could see he was such from the rod upon his shoulder—was tired, hungry, and in a rather depressed mood.

John Norcross was a young New Yorker, with plenty of means, leisure, and a passion for fishing and hunting. He did not like Broadway or town life in the least. They seemed to bore him. He had been to Europe, and was not much interested in Paris, or Rome either. He came back gladly, and having heard that the New River region in Virginia was a wild and picturesque country, full of game, proceeded thither. At the station of the railway he procured a horse, and struck into the first road he saw, and this brought him to a small house covered with clapboards, with a well-sweep in front, in a gash of the mountain. At the door stood an old countryman with long gray hair and a guileless smile on his lips.

"I have come here to fish and hunt, friend," said Mr. Norcross, entering upon business. "Can you entertain me—for a month, say?"

"To be sure," Daddy Miller replied, emphasizing the "to be," and pronouncing it "*toob*-ee."

And all was soon arranged on an equitable basis. Mr. Norcross returned his horse, and his baggage was sent for. He was the lord and master of a neat, clean chamber with a snowy bed, some asparagus bushes in the fire-place, a gaudy print on the wall of a young lady with crimson cheeks, whose name, "Jenny," was printed beneath, and a fine view of the chickens in the yard, and the mountain, through the small window. In this to him highly agreeable abode Mr. Norcross set up his rest, that is, scattered around him some magazines and books on hunting and fishing, produced his meerschaum, and put together his breech-loading carbine and jointed fishing rod. Aunty Miller, in huge frilled cap, and resembling an amiable meal-bag with a string around the middle, looked after him in a motherly way, and all was precisely to his liking. He had broiled chicken and wheat and corn cakes, with coffee and country milk and cream, for breakfast; and then Mr. Norcross would sally forth, carrying gun and rod both, and quite content with all around him. He was twenty-five or twenty-six, and a tall, fine-looking young fellow. He was anything but foppish; but his hunting coat, full of pockets, and fair leather gaiters, were from the shop of the best artist in London, and his open face and general appearance were agreeable.

On this day he had been fishing from morning till night, solacing himself about noonday with cold meat and bread from his sachel. His luck had been indifferent; he had wandered on and on until he lost his way, and now as the sun was sinking he was indubitably lost. He could not even find the path along the stream which had brought him; and here was night at hand, with no habitation in sight.

He was standing on a pile of rock overgrown with a profusion of Virginia creeper in full pink bloom, when he saw fording the stream beneath him what seemed to be the figure of a girl on horseback. The dusk blurred the figure, for the sun had just disappeared; so he leaped down from his rock, went to meet it, and reached the bank just as the horse and rider came out of the water.

He was a venerable animal, with head depressed, a furry hide, and that air of being surprised at nothing which characterizes age in equines. Across his back lay a meal-bag, and in front was a worn side-saddle, on which was perched a girl of about twenty, wearing a cheap calico and a chip hat. Her complexion was brown, but fresh-colored, and her eyes black; her hair also, which she wore in a coil behind her neck. Her general appearance was decidedly rustic; but another glance showed John Norcross that this first comprehensive impression was erroneous, or at least did not accurately measure her individuality. Those familiar with the uneducated young female of the plainer class know their queer airs and graces—the sidewise toss of the head, the negligee bearing, and the stolen glances as they answer you. This one was different. She sat erect in her saddle, the handsome head poised firmly on the shoulders, and looked straight at Mr. John Norcross out of her calm black eyes. She was tall and rather slender like himself; the whole pose of her figure was grace and ease—no, she was not a rustic belle, the fisherman said to himself.

He came up and took off his hat to her as her horse walked up the bank.

"I have lost my way, miss—I am staying at Daddy Miller's," he said, politely. "Can you direct me?"

"Daddy Miller's? That is a long way down the river," the girl said, stopping. She had made a motion of her head in response to Mr. John Norcross's salute, which

"I HAVE LOST MY WAY, MISS."

he internally decided was quite *comme il faut*—not too slight or too marked.

"Still I must get back to-night if I can, miss," he said. "I am a stranger in this country—I came to hunt and fish. I don't like the idea of spending the night in the woods, though I've often done so."

She looked at him, apparently hesitating. There was light enough for him to see her bright eyes in the dusk.

"That would be very hard," she at length said. "No, I don't think you ought to sleep in the mountain. If you choose—"

She stopped; the hesitating look came again. Their eyes met, and his expression seemed to decide her.

"If you choose," she said, "you can come and spend the night at father's. It is not far."

Norcross was a young man who took

things as they came, and rather liked the unexpected. He was not wedded to his domestic lares at Daddy Miller's, and preferred to range now and then. He said:

"Thank you, Miss—Miss—"

"My name is Conny Neal," she interposed.

He laughed, and said, in the frank way which made him friends every where: "But *Conny* is 'short' for *Constance*, I suppose. I am too much of a stranger to be familiar, as I should be if I called you Miss Conny."

"Constance is my full name, but they call me Conny," she said. "There is no reason why you should not."

"Then I will accept your invitation, Miss Conny."

So they went along up a winding path leading into a gorge of the mountains, talking by the way. The girl informed him that she had been to the mill, some miles distant, for meal. They had one man-servant, but he was too old, and she did not mind going, as she knew every body—all in the same quiet voice, which John Norcross began to find more and more agreeable to him. Tone and expression both had a fresh charm which he had not found in cities. Her pronunciation and selection of words were both correct beyond criticism. Beyond this nature asserted herself. Norcross thought, "This girl is a young tree of the mountains, only with the straggling branches lopped off."

"This is father's house, Sir," she said, pointing to a small, weather-boarded farm-house on the slope of the mountain. They passed through a gate in a low fence, and crossing a grass-plat, stopped at the door in front of a little porch with a bench on each side, and reached by two steps. The house was of one story, with a garret and dormer-windows. The narrow passage ran from front to rear, and was furnished with two split-bottomed chairs, and a pair of deer's antlers on the wall, across which lay a fowling-piece. Some tawny deer-hounds were lying about, snapping at the flies, and a majestic sultan in the shape of a turkey-cock promenaded grandly in the midst of his family.

Norcross assisted the girl to the ground, and then proceeded to shoulder the meal-bag and place it on the porch. The girl had opened her lips to tell him that this was unnecessary, and in fact an old hobbling negro man was approaching slowly from the rear, but at that moment a man came out of the front-door, and Norcross, rising erect after depositing the meal-bag on the porch, bowed to him.

Norcross looked curiously at his host. His figure was striking. He was a man of about fifty, tall, very erect, powerful, with a high forehead, piercing eyes, and a heavy beard and mustache. He wore a velveteen hunting jacket whose white seams showed that it had served its owner for many a long year, and deer-skin leggings reached nearly to his knees. It was the dress of a hunter, and the host seemed to recognize the same proclivities in his chance guest.

He bowed, invited Norcross in, and the girl explained every thing in a few words.

"You are welcome, Sir. My name is Neal, at your service. So you are staying at Daddy Miller's?"

"For about three weeks. I came to hunt and fish, and have had a splendid time."

Norcross had moved about the world a good deal, and was off-hand with new acquaintances, which made him friends. His laugh and whole manner were frank, and his host, who had been rather grim at first, was plainly thawing.

"I live in New York," said Norcross, "but I like the country better than town. I get tired of streets and big houses. Daddy Miller's home is better—and yours too."

He looked round him at the white walls with an air of satisfaction. There were some silhouettes in plain oak frames here and there, and on a table in one corner were some books—not many, and much worn. The floor was bare and sanded, and a few split-bottomed chairs, upright and with rockers, were nearly all the furniture. Every thing was perfectly neat and perfectly plain, down to the tallow candles burning in tin candlesticks.

Conny Neal had disappeared as soon as she arrived, and now came in and said that supper was ready. It was excellent, and served in the opposite room by an old negro woman, who ducked her head to the guest and then retired. Conny presided, and talked easily; and after eating like a ploughman, Norcross smoked and talked in the other room; then he began to yawn, and his host rose and led the way up stairs to a bedroom closely resembling his own at Daddy Miller's, ushered him in, and left him.

Norcross was tired, but in spite of that fact did not go to sleep. He could not get Conny Neal out of his mind. As often as he closed his eyes her own dark ones began to glimmer in his mind, and he was wide-awake again, half expecting to see her near him. This insomnia went on until nearly midnight. Norcross was then aware that some people were talking below at the back-door of the house, and, curious to know who was stirring so late, he rose and went to his window, which was open. The moon was shining, and he saw his host come out, in company with another person in the rough dress of a mountaineer.

"Who sent word?" Neal said to his companion.

"Tony," was the reply.

"Do the men know?"

"I have been the rounds and seen some, and I'll see the rest before morning."

"Right. When will *they* be here?"

"To-morrow night, Tony says."

"Well, if we are pushed too close, we will fight. The war is over, but I am ready to begin again."

"So are the boys—so are the boys, captain."

"Well, give them the orders; they know the place. Every man armed."

They passed beyond hearing, into the shadow of some pines silvered by the light of the moon, which had just risen. Norcross came back from the window and went to bed, where he found sleep harder than ever. What did all this mean, and who were to come armed, to do what? He knit his brows, profoundly puzzled. At last the wrinkles grew smooth and his eyes closed. The day's tramp conquered his curiosity, and he fell asleep.

About three weeks after this visit Norcross wrote the following letter to a friend in New York:

"Dear Tom,—What you predicted would happen one day or other has happened—I am done for. The friend of your bosom is in the toils, or something like it. Her name is Conny Neal, and she is the daughter of a splendid fellow, who has only one drawback—he is an ex-rebel soldier, and an *enragé* one, I assure you. As a good Republican, believing in the depravity of all who differ with me, this, of course, is sufficient to ruin him in my estimation. But, after all, he is a noble fellow, and, above all, his daughter is a paragon. Imagine a girl brought up in a poor house in the mountains who is a lady, technically speaking, even to her finger-nails. I met her by the merest accident while out fishing one day, and looked upon her at first as only a rustic beauty without culture. Never was man more mistaken. She is better read than I am, and a person of the utmost refinement, with all the grace of nature; and such eyes—such eyes, Tom!.....

"I have given you thus a whole page describing her mind and person, and come to the main point—I am captured. I have not the least idea of how it will all end, and have really resolved on nothing. To speak seriously, I don't well see how I can get along without her in future, and foresee I shall have to tell her so. But then? Say she accepts me—which I assure you is by no means certain—not by *any* means. I shall be a hawk in a cage, and my papa-in-law will be a rebel hunter of the Virginian mountains! Decidedly I can't think of it—that is, I think of it all the time.

"There is something even worse—some mystery or other at least that I don't like. I am lodging with an old fellow named Daddy Miller, and people are constantly coming and going on some mysterious business. What does it mean? I can't divine, and, what is worse, can't discover. Silence seals every lip, and I am conscious that eyes are constantly upon me. It is the same at her father's house, where mysterious figures come and go at all hours of the night in the strangest manner. This is odd, and not agreeable. What does it mean, I say? As you are not able probably to answer that question, I will endeavor to send you a reply to it in a few days.

"I see Harry has given up chasing Indians in Idaho to come East and get married in October. Give my love to him and my little sister to be, and tell them I'll certainly be present at the wedding.

"Your friend, John Norcross."

This letter defines clearly enough the situation of affairs when it was written. John Norcross had fallen in love with Conny Neal, and the affair was serious. It was actually his first passion, and men enter upon their maiden campaign in love, as in war, with very different feelings from those of old battered soldiers tried in numerous encounters. As he knew the girl better and better, she quite charmed him. She had great force of character, a temperament as open as his own, and a warmth of heart under her calm exterior which quite fascinated him. She was not at all "sly," and entirely without finesse, that bane of female character; she concealed nothing—not even her growing fondness for Norcross. It is probable she did not realize this, or no doubt she would have schooled her face and voice when he came. She schooled neither, and was all the more charming to him as she came to meet him with a faint color in her cheeks, and eyes which caressed him as he approached.

This was imprudent in Conny, perhaps, but then it was natural, and she followed nature. Norcross was the first person she had ever met who could talk to her about books and the great world. Her father was by no means an uneducated person, but he seldom read any thing; and thus it happened that Norcross brought with him the first breath of the outer world, and they talked of a thousand things. His visits had been constant; he had become the friend of the family; and when Conny's interest and curiosity were satisfied, her heart began to mix itself with the affair. Norcross was a handsome young fellow, full of ardor and the zest of life. She was a woman, and read his fondness in every glance of the black eyes. Then what always or nearly always follows followed. The *vita nuova* began for Conny Neal, and Norcross's letter showed that it had begun for him also.

September had come, and the mountains were slowly assuming the magical colors of autumn. In August the slopes had been

clothed in deep green, over which the shadows of floating clouds moved slowly, or swept on at a gallop before the fresh winds. Now the green had disappeared. The maple and dogwood were as red as blood, and the hickories were like molten gold. These shaded off into orange and russet as the days advanced; and over this wonderful spectacle, over mountain and valley and river, drooped a dreamy haze, rounding every outline, and making the landscape a fairy-land to the delighted Norcross. He used to go off to the river sometimes with Conny Neal, and sit at her side on some granite shoulder jutting out from the side of the mountain, and they would talk for hours—about what? About every thing or nothing. It was the same. They were near each other, which was the great thing, looking at each other, and listening to each other's voices.

On one subject they never touched—the mysterious coming and going at Daddy Miller's and Neal's. This arose from delicacy in Norcross. He felt that he had surprised his host's secret—for secret there evidently was—on that first night at his house, and was a little ashamed of having listened at his window. Eavesdropping and covert action of every description were the young man's abomination, so he said nothing, defending himself in his own opinion by saying to himself that he had not meant to listen. Could he defend himself as successfully with Conny? Possibly, but not certainly. So he asked no questions, not alluding, even, to a mystery which was necessarily no mystery to her. That she knew all about it he was perfectly well satisfied: if she chose to speak, she would do so.

With Daddy Miller it was different. Norcross was not a guest there, only a lodger, and one day he said, "Who comes to see you often at late hours of the night? Do you know one thing, Daddy Miller?—if you lived on the sea-shore I should set you down for a smuggler."

"Smugglers?" said Daddy, scratching his head gently, and smiling in a guileless way. "Oh yes, I've hyeard about sich. But we're a long ways off from the sea, I'm told."

"Well, that is the difficulty. You and your friends are not smugglers. What are you?"

"Bless your soul, we're honest people," said the guileless Daddy Miller, with his sweetest smile—"plain country people a-visiting each other at odd times after work."

"One of your friends is named Tony; who is Tony?"

"Tony?—you know Tony? Oh yes, Tony Tummles is a neighbor of ours."

"What is his business?"

"Business? He's a poor man, and puts in his little crap and shoots game for his family."

Norcross mused, not satisfied with the reply.

"Look here, Daddy Miller," he said, "you're not talking to an outsider or an enemy. I am not a Virginian, but I like your people, if I *am* a Northerner. Something is going on that will get you into trouble. What is it? Are you Ku-Kluxes? That's a bad business, but none of *my* business, and I won't report you to Blaine or Conkling. But what are you about? I know more than you think. Make a clean breast of it—you can trust me."

Here a worthy, past middle age, in a scarecrow suit of clothes and heavy boots, came in. An old brown slouched hat was perched on his shock of hair, his eyes were piercing, and his thin lips smiled ironically. A stubble of beard surrounded them, and tobacco juice decorated the depressed corners.

"Why, Tony," said Daddy Miller, shaking hands, "we were just talking of you. My young friend here thinks something's going on hereabouts."

"Something a-going on?" said Tony Tummles, with an innocent air, full of mild inquiry, and ducking his head in a friendly way to Norcross.

"He thinks it's the Ku-Klux, whatever that might be," said Daddy Miller.

At this the new-comer laughed.

"Oh no! we're peaceful people. No trouble about here, though I'm told there is below yonder. Oh no! But I jest dropped in, Daddy Miller, to borry your screw-wrench. My ploughshare, the dratted thing, is broke agin."

Whereupon they discoursed on country matters, and repaired to a shed to hunt up the screw-wrench.

Thereafter Norcross felt that he was watched. This fact was plain to him in many ways. At Daddy Miller's chance visitors, or what seemed to be such, looked sidewise at him, and he caught their eyes. The mysterious night visits ceased, and the coming and going fell off perceptibly. Eyes seemed to follow him every where; and even Aunty Miller, the venerable meal-bag, would lower her spectacles until they rested on her ancient nose, and gaze at Norcross over them as she sat knitting a stocking in her wadded arm-chair in a corner. He was evidently the centre of general interest, and especially when he went hunting or fishing. Accidentally some one seemed always in his vicinity. Sometimes it was a mountain urchin, with a diminutive mule and a chicken-coop of a cart, hacking dry wood for the home kitchen. Sometimes it was a girl with tangled hair gathering sumac, or a hunter, gun on shoulder, who met him in out-of-the-way places, and looked keenly at him. These encounters had not taken place during the early part of his sojourn in the mountains. That they occurred so frequent-

ly now left no doubt that they were intentional. To repeat, Mr. John Norcross felt that all eyes were upon him, and his curiosity deepened to ascertain what it all meant.

He was soon to discover.

One autumn afternoon John Norcross and Conny Neal came at last to understand each other. They had walked out from the small house on the slope of the mountain to the river, and were wandering along the bank, talking only now and then, and rather vaguely. The sun was near the summit of a fringe of woods crowning the western mountain, and the gold of the leaves shaded off into the green-orange of the sky. The river brawled over its rocks, carpeted with moss and ferns of a hundred varieties. Here and there a huge pine or poplar, with a cavern washed away under the gnarled roots, bent over the current, dipping its tassels or tulip-like buds into the foam.

They sat down, and the old story, which has been told over and over again for the last six thousand years, was told in the autumn evening. Norcross poured out the whole burden of his thoughts in his frank, ardent voice, and Conny only answered in a murmur. As she turned her head slowly over her shoulder, however, and fixed her eyes upon his own in one long glance, shy, confused, but confiding, Norcross knew that there was no longer any doubt, and putting his arm around her neck, he drew her to him and kissed her.

"Now, Conny," he said, his face glowing, "we will go home and ask your father."

They went back hand in hand, and Norcross did not drop the hand as he walked up to the porch where Captain Neal was sitting. Conny went up stairs, and Norcross sat down and told his host every thing.

Neal listened without a word. He seemed to be musing, and his face was impenetrable. When Norcross had finished, he said, "So you wish me to give you the only human being that makes life worth any thing to me?"

"Yes," said Norcross; "I love her, and she loves me."

Neal said nothing. It was easy to see, under his soldierly coolness, that a storm was raging in his breast. His brows contracted, and he drew a long breath, his eyes fixed upon the ground. At length he raised his head, and Norcross was struck with something noble and imposing in his firm look.

"The time has come for us to speak plainly, my young friend," he said, in his strong, vibrating voice. "First, do you know who and what I am? I am an ex-Confederate soldier, and feel as I felt when I fought with Lee. The South is crushed, and all that is over, but the men of the South are not crushed, or ready to court her old enemies."

"So be it," said Norcross; "do not do so. The North does not expect it. You were a good Confederate, and went with your people: remain such still."

"I am more—or worse, if you choose—than an ex-Confederate; I am an illicit distiller of spirits in this mountain."

Norcross turned his head quickly, and looked at his host.

"Ah! that explains every thing," he said—"all the coming and going and mystery yonder and here. You are 'moonshiners,' as the cant phrase is."

"Yes," said Neal.

Norcross knit his brows. All was perfectly plain to him now—the looks of Daddy and Aunty Miller, the visits of Tony Tummles, the watching, every thing.

"It is a pity, a great pity," he said, involuntarily, "in a man like you."

"I am no better than my neighbors," said Neal, coolly; "a little better educated, perhaps, but they were Southern soldiers like myself, and fought as well, perhaps better. We are all poor alike now, though I was well-to-do once. We are honest men, and not ashamed of any thing we do."

"But this illicit business, Captain Neal—you are acting in open defiance of law."

"Yes, of Federal law; the State receives its tax. The Federal law is an oppression, and we disregard it. We make whiskey and dispose of it in this region without paying a tax to the general government. We are poor people, and harm nobody. They have only to let us alone."

"But how can that be? The law must be enforced."

"The revenue collectors can not enforce it."

"Then it is the duty of the government to send troops to see that the laws are obeyed."

"Let them send them."

"You will resist?"

"Certainly."

"With arms?"

"Assuredly. I mean that we will fight," said Neal, coolly.

Norcross drew a long deep breath. It was easy to see that he was troubled. It was impossible to look upon Neal as a vulgar law-breaker engaged in illicit pursuits from mere greed of money. Right or wrong, he was acting as he believed he had the right to do, looking at the matter from his own point of view. But then to marry the daughter of an illicit distiller! To take his bride, the mother of his children, from such surroundings! He was not much of an aristocrat, but the idea grated, and his feelings were perhaps reflected in his face.

"I have been frank, you see, friend," Neal said, in a few moments. "Let this end every thing. You can not marry my daughter. I am a law-breaker, and may be thrown into jail to-morrow as a common criminal, or shot if I resist the revenue officers."

Norcross knit his brows again, making no reply.

"You see all that must be forgotten," said Neal. "You will go back and lose sight of every thing here, and we will remain good friends. You are a fine fellow, and I liked you from the first. Let us part in peace. You will soon forget Conny—"

"I can not forget her! I can not give her up!" the young man exclaimed. "I can not live without her!"

"And yet you expect *me* to do so," said Neal, calmly, but with the same deep feeling evident under his coolness; "you ask *me* to give up all *I* care for on earth! What will my life be to me without her? I am alone in this world if she leaves me. She is my only child. I loved her mother more than man ever loved woman, I honestly believe, in this world, and when she left me I wished to die too. I was in despair—it is an extreme word, but a true one. I broke my heart longing for my wife, the only woman I ever loved, and all that made my life endurable was the love of my little girl. She has grown up at last from a rosy-cheeked child to a woman. She is my companion, my sole thought, all I value on earth—and you come and say to me, 'Give me Conny, because I love her.' Do I not love her too? What am I to do here in this lonely house without her?"

Before Norcross could reply to these words, a man on a rawboned pony came up a path leading from the river at full speed. He was a scarecrow figure with a ragged felt hat, and carried a gun in his left hand. Norcross recognized Tony Tummles.

"Look-out, captain!" he cried, as he reached the small gate; "they are coming!"

Neal coolly rose and walked to the fence. "Where are they?" he said.

"On the road, five miles off."

"How many?"

"A squad of fifteen—cavalry with carbines."

"Did you see them yourself? Your report last month turned out to be nothing."

"They were coming here then, but went to the Kanawha. They are after us now—I talked with some of them in the town."

Neal leaned on the fence for a moment, reflecting. He then said: "Give the men notice, and order them to be at the old place in an hour. No man is to show himself or fire at any body. They will have firing enough before morning."

"You mean to fight, then, captain?" said Tony Tummles, with an air of great delight.

"Certainly I do."

"Hurrah!" cried Mr. Tummles. "You couldn't please the boys better, captain. They don't like the blue-coats. I eetched to git at 'em in town yonder; my gun burned my fingers. The boys 'll git the orders, captain."

With which Mr. Tony Tummles dug his heels into his horse and disappeared at full speed in the woods covering the side of the mountain. Neal then turned to Norcross.

"You see," he said, coolly, "the affair will be settled sooner than I expected. There will be a fight to-night, and perhaps this is our last meeting. You see the hand of the law is stretched out to clutch me, and that ends all discussion. You can not marry the daughter of a man who will be in jail to-morrow, perhaps—if he is alive."

"No matter!" exclaimed Norcross. "It is nothing to me. Give me Conny."

Neal looked at him mournfully, with a sudden softness in his bold eyes.

"You love her really," he said; "I can see that. Well, let us come to an agreement. I mean to fight to-night, and the matter will be no child's play. If I am killed, Conny will be alone in the world—"

"No; she will have *me!*" Norcross exclaimed.

Neal grasped his hand and said, "Then all is arranged: take her. Now I advise you to go home. The revenue guard will soon be here."

Norcross did not move—Conny Neal's steps were heard coming down the stairs.

"I am not going," he said—"back to Daddy Miller's, at least."

"Where, then?"

"Where you are going—into the mountain."

About ten miles from Neal's was the town of C——, a long straggling village with numerous stores, some private residences, a blacksmith's shop, and a tavern, the resort of idlers and quidnuncs generally, who solaced their leisure with drams of bad whiskey served to them by a bar-keeper with soap-locks and in his shirt sleeves.

On the afternoon of this day a crowd had gathered in front of the tavern. They were looking at a number of United States cavalrymen in blue coats who were going to and coming from the blacksmith's shop with their horses, or taking the animals to water at a little stream overshadowed by willows which crossed the main road at the edge of the village. On the veranda, which extended along the whole front of the tavern, a young man in the uniform of a lieutenant of cavalry was seated smoking a cigar. His appearance was rather foppish. His hair was long and curling, a delicate mustache shaded his lips, and the hand holding the cigar was covered with jewels. With his elegant riding boots elevated upon the railing before him, he leaned back in an attitude of careless ease, conversing with a personage in citizen's dress who was standing near.

"I will set out in half an hour," he said, carelessly. "You and your people are ready, I suppose?"

"At any minute, lieutenant," said the man in citizen's dress, who was a middle-aged personage with a black leather box swung like a sachel on his left side.

"It's a cursed business I am sent on," said the cigar-smoker, negligently, "and none of my seeking. Here I am, Lieutenant Harry Norcross, very much at your service, turned all at once into a revenue officer, and ordered to hunt down whiskey distillers in Virginia instead of Indians in Idaho. Never was there such infernal bad luck. I come East to Washington, and as soon as they lay eyes on me I am ordered here on this cursed affair, when I have my own private matters to attend to, I assure you."

He took a letter from his pocket and read it, oblivious of the man with the leather box. It was in the handwriting of a woman, and the contents seemed flattering. Lieutenant Norcross smiled.

"Jack is somewhere here in this outlandish country," he muttered, as he folded up the letter and replaced it in his breast. He then rose and said, with a yawn, to a cavalryman who was standing near, "Order the bugle to sound to horse. I will march in half an hour."

The man saluted with two fingers to his cap, and Lieutenant Norcross lounged into the tavern, from which he soon afterward emerged with his sabre and pistols. At the sound of the bugle the men had fallen into line, and the party now moved, with the lieutenant and the revenue officer riding in front. A personage in a scarecrow suit of clothes, who had been lounging about talking with the troopers, had meanwhile mounted his horse, which was tied near, and slowly ridden out of the village. This was the innocent-looking Mr. Tony Tummles. In going toward his horse he had reached his arm inside of a neighbor's door, and possessed himself of his gun. He now rode away slowly in a direction opposite to the mountain, but as soon as he was out of sight seemed to change his mind. He wheeled his horse, and digging his heels into the animal, went at full gallop toward Neal's, where he gave the alarm, as has been seen.

Night had now fallen, but the moon was shining, and it was easy to follow the road which wound before the troopers, white in the flood of light. The young lieutenant whiled away the tedium of the moment with a fresh cigar, and again communicated to his companion his views upon the subject of selecting army officers for police duty.

"Curse the whole cursed business!" he said. "There are enough stay-at-homes around Washington to send—why do they send *me*? What the devil do I care whether they make whiskey or not? If it's good, the more the better. Why can't you gentlemen in citizens' dress do your own fighting with these rebel moonshiners?"

"No, I thank you, lieutenant," the collector replied, with a laugh. "Every man to his trade."

"Humph!—well, here are two roads. Which leads to this man Neal's, who is the leader of your moonshiners, you say?"

"The road to the left. I have information that will guide us afterward; but these people are as cunning as Satan. If they are pushed hard they will fight, too."

"And you are going to get out of the way—eh?"

"Exactly, lieutenant."

"Well, that's right. Leave the fighting to the military, and take to your tree. I mean to make short work of them if they fire a shot."

"Well, yonder is Neal's—where you see the light."

The road wound down to the crossing where John Norcross had met Conny for the first time. On the slope of the gorge beyond twinkled a light; and splashing through the river, the troop steadily advanced toward it. In fifteen minutes Lieutenant Norcross halted his men at the low fence, and moving his pistol holster around to have the handle of the weapon convenient, he dismounted and walked up to the house.

The knock at the door brought out Conny. The lieutenant bowed and said,

"This is Mr. Neal's?"

"Yes, Sir," said Conny.

"I wish to see him."

"He is not at home, Sir."

Their eyes met, and the lieutenant smiled—his glance was full of admiration of the fresh face lit up by the tallow candle.

"Well, present my compliments to Mr. Neal when he returns, and say that Lieutenant Harry Norcross called to pay his respects."

"Lieutenant Norcross!" murmured Conny Neal, feeling a chill pass through her. The young officer had bowed, and was going back to his horse, so he did not hear this exclamation. He mounted, and said to the revenue collector:

"Well, which way now? Neal is 'not at home,' but has left a devilish pretty representative. I'm ready."

"This way," replied the collector. And he rode on, followed by the troopers, two abreast, by a bridle-path winding beneath heavy foliage into the depths of the gorge. No sooner had they disappeared than Conny Neal ran to the small stable in rear of the house and bridled the old animal which she had ridden to the mill when Norcross first met her. His slow, unwilling gait as she dragged him toward the house was a terrible trial to her patience. With venerable head extended horizontally and pulling against the bridle, he protested at every

step; but at last they were at the small back porch, and Conny threw on him her riding saddle, and hastily buckled the girth. Then, without waiting to get her hat, she leaped into the saddle, broke a bough from the tree above her head, and striking the horse violently with it, set off at full speed by another path, skirting the opposite side of the gorge.

The moon was soaring by this time above the top of the mountain, and seemed to peer down at her. Her long hair fell upon her shoulders, and her face was quite pale. Her eyes glowed, and at times a sort of shiver passed through her figure, swaying with the movement of her horse. She was going at a headlong gallop over the mountain path, leaping every obstacle—through the blackest masses of foliage, where she could not see a yard in front of her, as through the open spaces where her figure was lit by the weird moonlight. More than once her horse stumbled, but she lifted him with the rein and urged him on. If she could only arrive in time—only that—and tell *him* that his brother was coming! for she had divined that this was his brother.

Suddenly she heard shots in the gorge.

Just as the moon rose Neal and Norcross had gone on foot into the mountain. Nothing which the former could say would turn the younger man from his purpose. He only laughed and said:

"As there is going to be a fight, perhaps, I should like to see it. I have never heard the whistle of bullets, as I was too young to come and fight you in the war, and here is my chance."

"Do not go; you will expose yourself. Besides, these troopers are your friends."

"I have other friends besides. I will take no part on either side, but I mean to look on."

Neal could do nothing with him, and hastened to arm himself and repair to the place of rendezvous. Norcross followed, without regarding even the entreaties of Conny Neal. He was determined, he said, with another laugh, to see a night skirmish, if there was a skirmish; and leaving the poor girl a prey to anxiety and anguish, they hastened up the path afterward followed by the party of troopers.

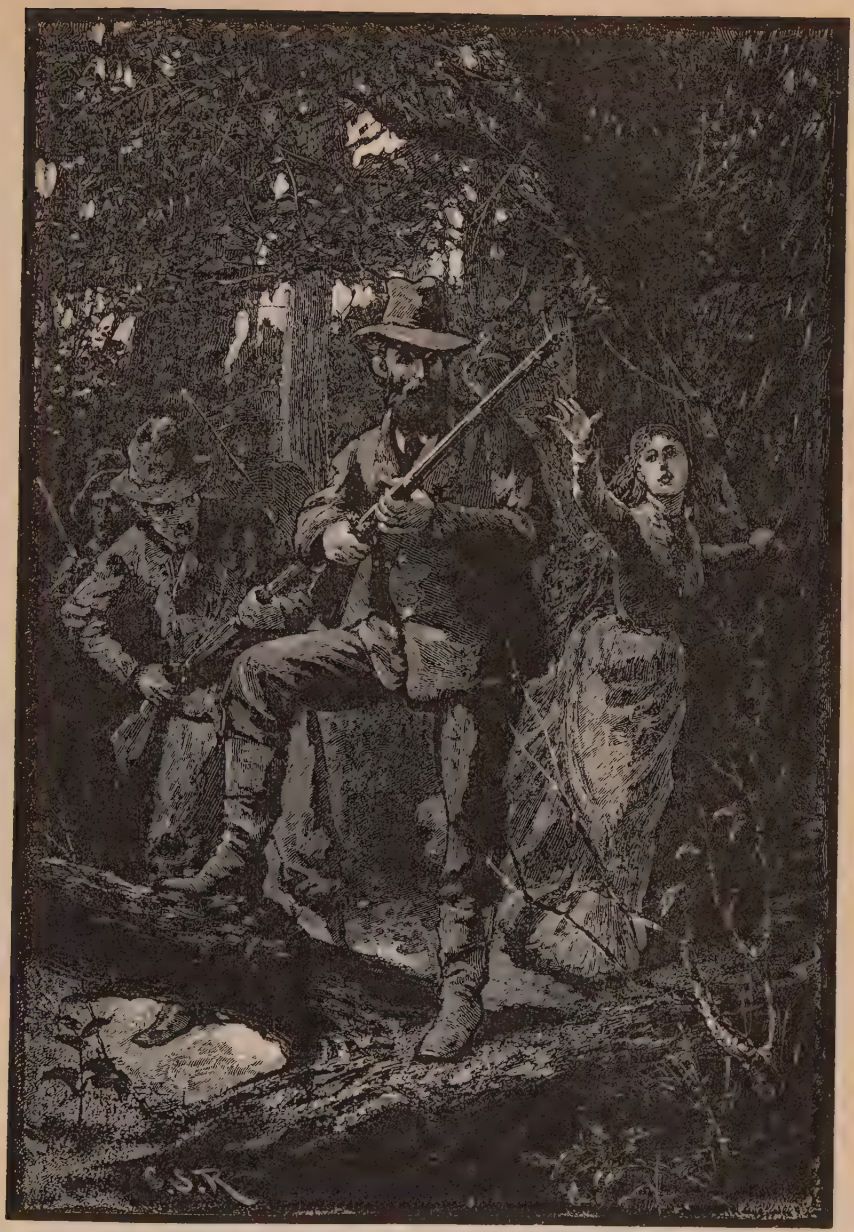
This path was apparently made by cattle seeking spots of pasture on the side of the mountain, and was well defined. After following it for ten minutes, however, Neal obliqued to the right and clambered up a rocky footway over which the boughs of the mountain ash almost interlaced. Then the path began to descend into a smaller gorge, opening into the first, and a voice said, "Halt!" Neal gave the countersign, and continued to advance. A few moments afterward he and his companion were in the midst of about a dozen men armed with old muskets and fowling-pieces. Behind them a low hut leaned against an enormous mass of rock, beneath which it was evident there was a cavern. This hut was secured by a heavy door, and had no windows. It was the still.

Neal gave his orders in the brief words of a man accustomed to command; and the ragged figures around him, grasping their guns, listened as men listen to their superior.

"They are coming," he said, "and I mean to fight. But this is not the place; the barricade is the spot—but only to fall back on. Scatter on the rocks above the wood, and look out. No man is to fire unless he is fired at. Then give it to them!"

At these words the men dispersed, entering the heavy foliage at different points, in which they disappeared. Neal, followed by Norcross, turned to the left, went up a steep acclivity, and they emerged on a sort of pinnacle of rock, from which they looked down upon the main gorge. Across a cleft on their right one of the men was seen watching. From the road below came the hoof-strokes of the troopers as they steadily advanced.

Suddenly the foremost figures of the party emerged into the moonlight beneath and came to a halt. Lieutenant Norcross, who was in front, had looked up and seen the man on the crag not far from Neal.



"Come down from there, you scoundrel!" he shouted, drawing his pistol as he did so, and firing at him. It was a mere random shot, but it struck the man in the breast. He dropped his gun and fell forward, exclaiming, "I'm done for, captain!" to Neal. He attempted to clutch some bushes near him, but the ball had done its work, and he fell dead in the road about fifty yards in front of the troopers.

"You see!" said Neal, with a flash of the eye; "this is war, you understand, neither more nor less. Well!"

He drew a hunting whistle from his pocket and blew upon it. As the sound rang through the gorge it was echoed from every crag by shots at the troopers. They scattered at once, but soon re-appeared on foot, advancing as skirmishers, and firing their carbines at every spot where the leaves moved or a puff of smoke rose. This fire was evidently accurate and deadly; the bright moonlight enabled them to take good aim. Groans were heard from point to point, and the troopers mounted the slopes, firing steadily with their repeating carbines.

Neal had looked on without firing. As to Norcross, he seemed to be in a dream. Had he or had he not recognized his brother? The voice was his, but it was incredible that he could be here. It was a fancy—a nightmare. He was aroused by a second signal from Neal's whistle.

"This is murderous," the elder said.

"OH! NO, NO! FATHER! FATHER! DO NOT FIRE!"

"Their arms are better than ours. To the barricade!"

He drew Norcross by the arm, and leaped down the declivity on the right. In two minutes he had reached a point where the smaller gorge debouched into the larger—a narrow mouth flanked by tall rocks. Here the men were assembling from moment to moment. Three were missing. Across the mouth of the small gorge a barricade had been constructed of felled trees. Behind this the men posted themselves, and they had no sooner done so than the troopers, deployed as skirmishers, advanced to the attack.

John Norcross had followed Neal, and was standing behind the barricade near him. His light mood had quite disappeared, and he looked on and listened with tragic emotion. For the first time in his life he wit-

nessed the spectacle of men putting each other to death. Too young to take part, as he had said, in the civil war, he had never for a moment realized the stern tragedy of the great grapple of the sections, or seen blood flow. He had now seen it, and his emotion was sombre and profound. Blackest of all was the fancy that he had heard his brother's voice.

"Attention!" Neal said to the men; "they are coming."

As he uttered the words a voice exclaimed: "Oh! no, no! Father! father! do not fire!"

Conny Neal, passing the gorge beyond, had dismounted, made her way along the slope, and now reached the smaller gorge behind the barricade, plunging down the steep bank, and only keeping herself from falling by grasping the pliant boughs of the trees. She was at her father's side, and it was her voice which besought him not to fire. She burst into tears, and wrung her hands, exclaiming to Norcross, "It is your brother!"

She had scarcely uttered the words when Lieutenant Norcross, in his gay uniform, was seen rushing forward at the head of his men, sabre in hand.

"Surrender, you infernal rebels!" he shouted.

Neal had mounted the barricade, and gave the order: "Fire!"

"Fire!" came at the same moment from the lips of Lieutenant Norcross.

A double volley rang through the gorge, and Neal, shot through the breast, fell forward on the outside of the barricade. At the same instant John Norcross, looking at his brother, saw him stagger. Without regarding the rain of bullets, he leaped over the barricade and ran toward him. It was too late. Lieutenant Norcross advanced a few steps, and fell nearly at Neal's side, dead, with a ball through his heart.

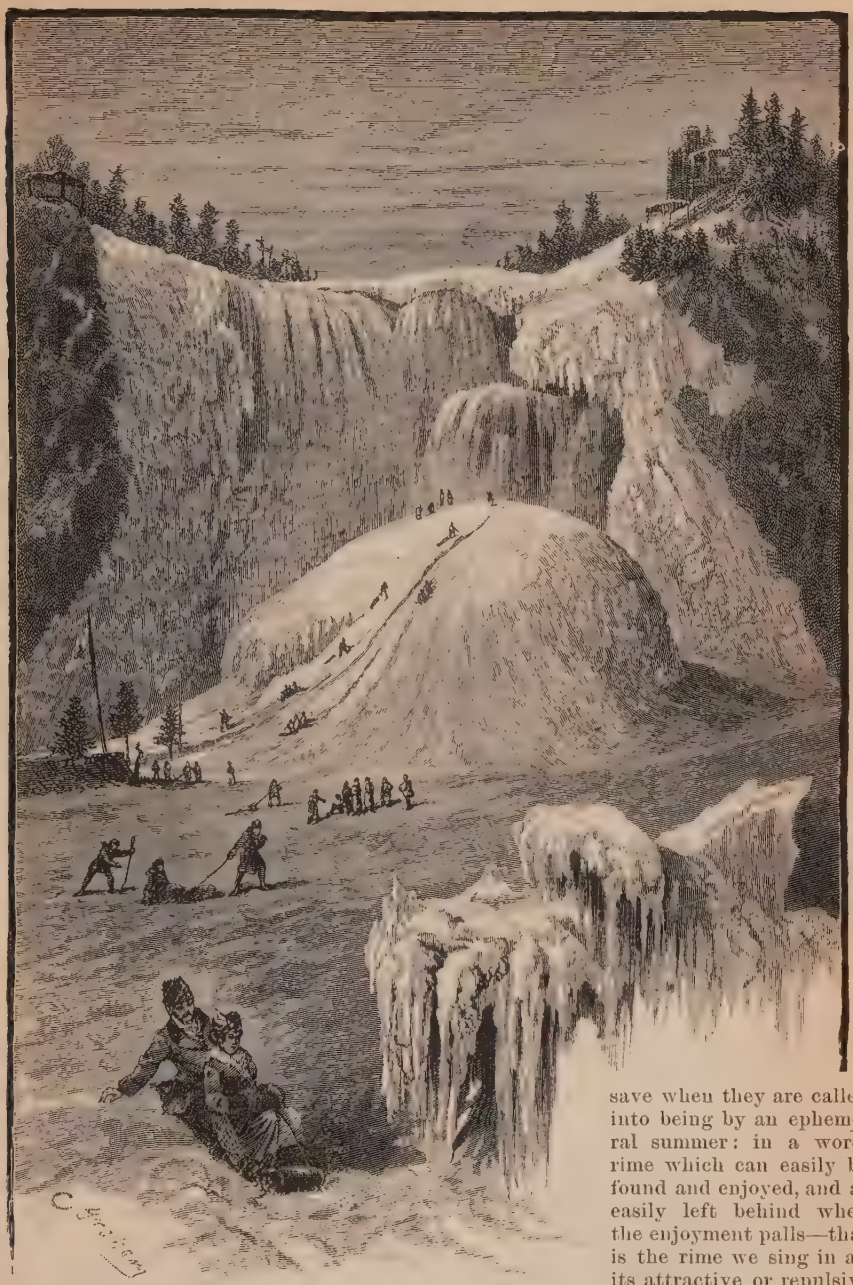
"Oh, brother! brother!" John Norcross cried, in his great agony.

Neal turned his head slowly. His eyes were already glazing. "Was he your brother?" he said, in a low voice. "It is a pity." As he said this, his head fell, and he expired.

As to the troopers, they were swarming over the barricade, and the moonshiners were scattering through the mountains.

Since the events above recorded many changes have passed over the New River region, and a number of citizens once prominent have disappeared. Among these the region mourns the upright Anthony Tummles, Esq., called by his friends Tony, who, in consequence of some difficulty with the revenue officials, has removed to Texas. Other well-known inhabitants deservedly esteemed and respected remain, however, and chief among these one affectionately styled Daddy Miller. Evil tongues connected him at one time with the illicit distillers of the mountains, familiarly designated as "moonshiners," but this scandal has now died out, and Daddy Miller is spoken of by his friends and admirers as the independent candidate for Congress, where he is expected to propose an act for the adjustment, peaceably if possible, forcibly if necessary, of the Virginia State debt.

All is bright and cheerful around Daddy Miller, but mournfulest of the mournful is another locality in this neighborhood—the house of the brave ex-rebel Captain Neal, who died a sudden death. The house is deserted, and weeds are growing around the porch.



Conny Neal has disappeared, and so has Norcross. He returned to New York, and was absent for many months. Then he came back and found that the poor girl had gone to live with an aunt in a neighboring county. John Norcross followed, and spent the autumn in hunting and fishing there. It was a hard task to bring back the thoughts of the beautiful girl in her black dress from her trouble; but Norcross, too, had his own distress, and they could sympathize with each other. Besides, they loved each other, and a paper yesterday announced that they were married.

SONG.

The fire-light listens on the floor
To hear the wild winds blow.
Within, the bursting roses burn,
Without, there slides the snow.

Across the flower I see the flake
Pass, mirrored, mystic, slow.
Oh, blooms and storms must blush and freeze,
While seasons come and go!

I lift the sash—and live, the gale
Comes leaping to my call.
The rose is but a painted one
That hangs upon the wall.

FROZEN CONE OF MONTMORENCI FALLS.

WINTER SPORTS IN CANADA.

RIME and its pleasures we sing. Not that rime which abides with eternal snow, and covers the dreary wastes of a frozen zone; but the rime of a comparatively southern latitude; rime that incloses forms of life in their normal condition of torpidity, save when they are called into being by an ephemeral summer: in a word, rime which can easily be found and enjoyed, and as easily left behind when the enjoyment palls—that is the rime we sing in all its attractive or repulsive shapes.

Our long-talked-of snow-shoe tramp had been finally determined upon. Wilkins preceded me by several days to the region about Quebec. Like most tourists, he had visited Canada only in the summer. He had passed many happy days upon the Saguenay and the lower St. Lawrence; had enjoyed the short-lived season among the limestone cottages and wooden ceilings of

Cacouna; had surveyed with his lorgnette the occupants of the small piazzas while they made futile attempts to ape the Saratogians; had admired the capacity of the neighboring farmers for bargaining; and had mingled in many scenes of pleasure, *quorum magna pars fuit;* but Canada in the winter was to him a land all unknown and untried.

No wonder, therefore, that Wilkins became fascinated by the novelties which were daily revealed to his delighted gaze, and that he sent for me to join him in Quebec, rather than in Ottawa, as we had originally planned. His appeal to a favorite author of my boyhood helped to turn the scale in favor of my going. Among other things, he wrote: "Tacitus somewhere speaks of the barbarians, with their blue eyes and gigantic stature, who slid down the snowy slopes of the Alps on their broad shields, and made the legionaries tremble as they surged against the gates of Rome. The Canadians also show their Berserker origin by sliding down the frozen cone of Montmorenci

ESPLANADE HILL, QUEBEC.

with an ease and nonchalance worthy the ancient barbarians, or the modern natives of Madeira as they dash down the steep incline at Funchal."

"Dear old Quebec," said I, alighting from the miserable ferry-boat and fighting my way through a persistent crowd of carters, "the memory of heroic lives sacrificed on your hallowed ground will endure forever."

This rhapsody ended with a cordial greeting from Wilkins. We ascended the narrow and crooked streets of the Lower Town, and passed through a gap in the walls which until recently had been closed by the solid portals of Prescott Gate. Workmen were even then degrading the ramparts to simple retaining-walls for the adjacent interior street, and only as high above it as might serve for a dog to look over. Indeed, one might feel inclined to test their security by leaping upon and over them, like another Remus before his brother, the first legendary Emperor of Rome.

"They are beating their swords into ploughshares, and are also improving the sanitary condition of the city," said Wilkins, "by building these large stones from the fortifications into the new sewers. Why should the walls be kept in repair at such great expense? The English forces were withdrawn from Canada years ago, and the two hundred men in yonder citadel could not defend themselves against modern artillery. Besides all that, how are they going to cut those new streets through without destroying the walls?"

My antiquarian spirit was aroused against the iconoclastic tendency of the age. "Our countrymen of the United States take pride in their streets numbered from 1 to 100, and in their avenues labelled from A to Z. A grand old historical town like this does not

THE TOBOGGAN.

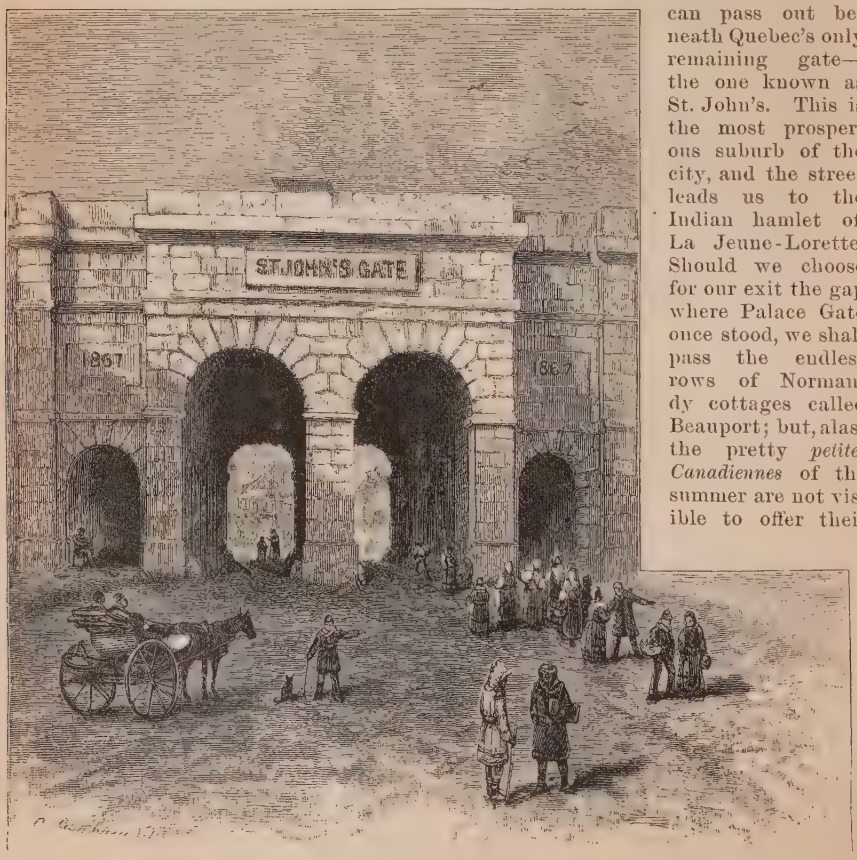
suit their practical ideas, and perhaps the city authorities here agree with them. I am glad to know that the walls are to be preserved as far as possible, and that towers are to be erected to break the uniform line of the ramparts."

Meantime we had taken a circuitous route past the Chien d'Or and the Université Laval, and stood upon La Grande Batterie—more formidable in appearance than any other part of the walls. Thence we passed through the Rue Port Dauphin, past the Archevêché, and stood at last upon the heights of Durham Terrace, with its great guns captured at Sevastopol. We looked down upon the roofs of the Lower Town, and into the very street where Benedict Arnold was wounded for his country in the earlier part of the Revolution. Below us was the broad expanse of the St. Lawrence River, stretching far away to the east, until its identity was lost in the horizon. On the right the quartz crystals of the promontory above us glistened in the morning sun, and gave their name to "Cape Diamond." Upon its rugged slope the battlements of the citadel converged at their nearest angle into the Prince of Wales Bastion, whence a lonely cannon frowned down upon us with the warning that we were at its mercy. So doubtless thought poor Montgomery, as in the dead of night he reconnoitred upon this very slope, and gave his life-blood for freedom with the closing hours of 1775.

The clear, bracing air of that height was the best of tonics. Why will travellers persist in visiting Quebec only in the summer? True, the winter is cold, but it has been reduced to a science. It is not the tricksy sprite, now warm, now cold, that it is 500 miles to the south; but its very uniformity makes it reliable. Its terrors are discounted in advance, and the proceeds are turned into pleasures of the hyperborean sort.

Where else in the world would you think of having a picnic with the thermometer at zero? Do not understand by this term a spread in the woods, but rather a combination like the following: a drive to Montmorenci, a short tramp on snow-shoes, an ascent of the cone of frozen spray (which rises 100 feet above the foot of the Falls), a ride on a "toboggan," and a night in an adjoining ball-room.

Or a "tobogganing expedition" is pro-



posed, and your party can start for the hills in calèches, towing their toboggans at the rear. These toboggans are peculiarly Canadian, and were first used by the Indians for the carrying of furs. They are made of long and thin boards or pieces of bark, bent up at one end and prevented from splitting by cross pieces on the upper side. Their seating capacity varies from two to ten persons. If ladies ride, they are placed in front, as in the picture. The vehicle is guided by the gentleman at the rear, with a stick, or, less gracefully, with the feet. A toboggan runs easily and rapidly down any hill-side which is covered with a thin snow-crust, and the effect of a "bump" at such a time can not be readily described.

If you are piscatorially inclined, you can spend a night on the St. Lawrence, and screen yourself from the severity of the weather within one of the temporary houses upon the ice. Comfortably seated in a chair and warmed by a stove, you almost lose sight of the fact that a splendid fish is nibbling at your hook. You pull him up through a hole in the ice, light a fresh pipe, and drop your hook for the next favor.

Then we might walk to the St. Louis Gate—or rather to the gap where the gate once was—whence Montcalm marched forth to give up his life, and the French supremacy in America as well.

Just outside the walls we might enter the Glaciarum, or rink, and enjoy some of the numerous contests. There will be races of all kinds—snow-shoe, three-legged, hurdle, and flat; but most amusing of all, the wheelbarrow and barrel races. The human wheelbarrow is made by one skater sitting upon his left foot, then extending the right foot forward, and finally turning the arms upward for handles. In this position he is trundled off by a companion. When the barrel race opens the contestants skate at full speed across the rink toward a number of headless barrels. Partially sliding for the last twenty feet, they endeavor to dart through, but the refractory barrels persist in rolling over and over the mirror-like surface, while the display of anatomical extremities is something remarkable.

From the rink we might walk down the Esplanade Hill, admiring on the way the interior slope of the walls. By an abrupt turn to the left we can pass out beneath Quebec's only remaining gate—the one known as St. John's. This is the most prosperous suburb of the city, and the street leads us to the Indian hamlet of La Jeune-Lorette. Should we choose for our exit the gap where Palace Gate once stood, we shall pass the endless rows of Normandy cottages called Beauport; but, alas! the pretty *petites Canadiennes* of the summer are not visible to offer their

ST. JOHN'S GATE, QUEBEC.

SLEIGHING IN MONTREAL.

flowers or a cup of cold water. A few bright blossoms even now beam their gladness upon us through small double windows, and in the background it may be that we recognize the countenance of our summer flower girl, saying, like the roses at her side, "Ne m'oubliez pas."

If our pleasure does not consist so much in out-of-door exercise, we may confine ourselves within the square mile of territory which limits the Upper Town, and wander through the splendid library of the university, attend the Provincial Parliament, sup with Père La Gacé at the École Normale on bread baked in the solid jail of the old Château St. Louis, visit the seminaries and enjoy the paintings in the chapel, or wander through the cathedrals—both French and English—and examine the bijouterie in the chapel of the Ursuline Convent. Whichever way we turn we are greeted with, "Bonjour, monsieur;" or the more inquisitive, "Restez-vous longtemps dans cette ville?" from some expectant carter, whose "Où logez-vous?" shows not only his wish for a job, but also his determination to follow you to your abiding-place. One need not be long upon the street to feel that an appropriate sign for an occasional shop window would read: "English is spoken here."

Amid this variety of entertainment weeks might be spent at "the Gibraltar of America," and the pleasures would not pall. They certainly did not pall to us, for it was with sincere regret that we turned our backs upon the citadel, and took the prosaic cars from the opposite bank of the river named after the gridiron saint.

"I think," said Wilkins, "that we Americans will have to yield the palm of endurance to the 'Canucks,' as they are often called. Statistics show that in the hardihood of their inhabitants Norway and Sweden stand first among the nations. Then come, in order, Canada, Germany, the United States, England, France, and Ireland. I recall a passage from Charlevoix, the historian, which describes the ancestry of the Canadians: 'A healthy though rigorous climate, frugal modes of life, protracted marches in war-time, hard work on the lands—to which combined all the feebler constitutions suc-

SKATING, MONTREAL.

cumbed, leaving as the real founders of the race only the robust, the acclimated, and the long-lived—are the intelligible causes of the excellence of the ancient Canadians with respect to courage and physical qualities.' And another authority says: 'The French of Canada are well formed, active, vigorous, and capable of great endurance. Owners and captains of ships will pay one-fourth more to French Canadians than to laborers of old France.'"

"All that is undoubtedly true," said I. "Why should it be strange that the exposure to severe weather should in the course of several generations develop extraordinary powers of endurance? And then, Old Trask notwithstanding (poor soul, he is now dead), the short pipe and pigtail tobacco are a part of every Canadian's outfit, and they help in the curing process which makes his flesh hard and firm. Then you will notice that although he may use costly furs or fabrics, yet the style of his garments is of secondary importance to their usefulness."

As we conversed there tumbled into the car a number of passengers clad in huge fur coats, and resembling immense 'coons walking upright. They divested themselves of their outer skins, revealing heavy undercoats of wool or lighter ones of deer-skin with the fur inside. Several had deer-skin boots with the fur still upon the exterior. There were also long outer coats of Irish frieze, or the shorter capotes of Hudson Bay cloth, with the inevitable hood in the neck, rosettes for buttons, and sashes of silk or worsted for holding them together. Boys of four years old and upward were dressed like the men, thereby affording assorted sizes of the same style in any well-regulated family. Every man in our car wore a fur cap. Of women there were none. The air was heavy with smoke, and the hours of the night resounded with song. Gradually we became oblivious to the idioms of those around us, and finally we awoke to hear the train dashing through Victoria Bridge.

In the gleam of the morning we are glad to step upon the broad and level streets of Montreal. Here the gas lamps do not hang from the houses across our path, for there is more room than in Quebec. The streets are blocked with a recent fall of snow, and the bright tin roofs suddenly precipitate their loads with a rushing sound not to be mistaken by any one who has heard it. Woe to the person who does not heed this warning! If he does not wish to be "bonneted," he must dodge either close to the building or toward the middle of the street. There is real danger in the crowded thoroughfare, since the movements of the dodger are not so free, and his feet are sure to catch in the ridge upon the sidewalk (made by former droppings of snow), just in time for the descending mass to dump itself "most emphatic" upon his devoted head.

Arrived at the hotel, we are ushered into a room which opens into a small court roofed with glass. This arrangement retains and utilizes the heat from the kitchen—a necessary economy now that wood is but little used, and most of the coal comes all the way from Pennsylvania.

Out-of-doors every moving thing is on runners. Wheels are nowhere visible, and huge sliding boxes have taken the place of cars in the streets. This is a very paradise for those who enjoy sleighing, because the

tariff of the carters is the same the year round, whether for runners or for wheels. The more pretentious establishments, with panoplied drivers and a wealth of black bear robes, move in a stately procession up and down the Rue St. Jacques, or glide rapidly around "the Mountain," or out to Lachine. Such is the ordinary winter-day appearance of Montreal.

"Those ladies look very well in their sleighs," said Wilkins; "but one should see them in the morning as they shop. Then they come out in all the glory of quilted skirts, black hosiery, and Arctic shoes. Their fur caps are well pulled down, and their heads are wrapped in clouds, Nubias, Abyssinias, or whatever else you choose to call them. The *tout ensemble* may show utility, but neither elegance nor grace. It is 'positively shocking,' as Dundreary would say, and is enough to spoil the fairest face and the finest figure. Why, even their back hair—"

"My dear Sir," I interrupted, "you have proved yourself a man of observation as well as a misogynist. But you must remember that the ladies of Canada believe in training the mind rather than in decorating the body. In their apprehension of the ex-

THE MOOSE-HUNTER.

act sciences they far excel their sisters of the United States. They even dispute with their own countrymen the pre-eminence in such studies, while the acquisition of the French language is a rudiment and not an accomplishment. Canadian social life, therefore, differs somewhat from the American. The basis is confidence and sincerity; and these being assured, the ice is at once broken. Acquaintance with a stranger may be sought in a dignified manner, requiring a dignified manner in return; but if that acquaintance passes to a state of friendship or intimacy, it will be found that there are many jolly ways about those same Canadian ladies of whom you have so poor an opinion."

"You are altogether a woman-worshipper," was the reply. "Look at those two men with their fur great-coats as they are

drawn by small mouse-colored horses recently clipped. They look like two cubs drawn by rats; and the fur should be on the animals, and not on the men."

The sight was extremely ridiculous, but the air was keen. We stepped within our hotel, in order to enjoy the rest of the cavalcade from a more comfortable spot.

Thus the days passed, with a drive, a tobogganing expedition, or a snow-shoe tramp about the Mountain. Occasionally we visited the rink, to which strangers are so generously admitted—a place made famous by the visit of Prince Arthur several years ago.

On Sundays and festal days we listened to elaborate music at the old parish church or the Gesu, attended the preaching of the Word by the most popular divine in the city—a young American—or allowed ourselves to be amused with the choral service in the Church of St. James the Apostle, but more especially with the medley of waltzes and galops which the sweet-toned organ gave forth after the service was over.

By advice of our friends we determined to hire a calèche which should convey us to Ottawa in the course of two or three days. Having prepared ourselves for the journey, we were glad to hear the porter announce, "La calèche est à la porte."

Our route lay along the bank of the St. Lawrence, past the rapids, and toward the town of Lachine. The drive is only nine miles in length, but it is one of the most enjoyable in the whole Northern region. The keen and invigorating air of the morning touched a chord in our breasts responsive to that described by Sangster, the leading poet of Canada:

> "Tinkle, tinkle, tinkle,
> Merrily, merrily, O!
> Life is but a sleigh-ride
> Through the frost and snow.
> Ever we are learning
> This one truth while we go—
> All sadness without sunlight
> Is like winter without snow."

Our first halt came, alas! too soon, at Lachine, where we paused to equip ourselves more fully for the expedition. The inner man and the innermost recesses of the calèche having been filled with refreshments, we turned northward and followed the Ottawa, now on the river itself, and now on one of its banks. Onward we went over the snow-drifts, until the deepening shadows of the afternoon warned us that night was at hand. Occasionally the cabin of a *habitant* appeared, but the accommodations were so small that we did not dare to ask for shelter. Luckily for us, Baptiste, our driver, knew of a friend who would take us in, and with whom he had had the forethought (so unusual in one of his race) to plan that we should spend the night. Still on we passed through the deep stillness of the forest; mile after mile of leafless loneliness was passed, and each mile seemed to add to the impressive silence. The ancient Greek, with his numerous gods, could not have had one to represent that awful grandeur, that sense of the infinite, which broods over the solitary wilderness of the North in the dead of winter.

At last we came to a cabin of the better class. The host was Xavier Croteau, and he welcomed us as friends of Baptiste. We supped on peas and poultry, and sat down to enjoy that source of never-ending jollity, the pigtail tobacco.

When friend Xavier had visited his root-house and attended to his horse, we again gathered round the fire. We told him who we were, and for what purpose we had come. We then asked him about the Indians, whom we had expected to see in considerable numbers. Xavier informed us that we might meet one or two Indians on our way, but that we would scarcely see more until we reached Ottawa. "And even then," he said, "you will not see many, although it is the fur mart of this section."

"Of what tribe are these Indians?" we asked.

"They belong mostly to the Algonquin nation, and are of various tribes—the Ottawas, Pottawatomies, Missisauquas, Chippewas, and others."

"Does not Mrs. Jameson in one of her books speak of the Chippewa tongue as being the court language of the Algonquins?"

"Yes. It was the court language as long as they had a nationality; but the poor Algonquins were overcome by the Iroquois more than one hundred years ago. Even the Hurons, who dwelt on the lake of that name, and who were related to the Iroquois, were destroyed by the latter, on account of their proximity to the Algonquins."

"But that was some time before."

"It was about the year 1650 that the tomahawks of the Iroquois made an end of the Jesuits and their most promising mission in New France, the one among the Hurons. Have you ever been in Lorette, La Jeune-Lorette, the Indian village on the St. Charles River, near Quebec?"

"Oh yes, we have been there."

"Well, the Indians who live there are all who are left of the Hurons, or Wyandots, except a few who live on the Detroit River near its mouth. The ancestors of these Lorette Indians were a mere handful, conducted thither by the Jesuits after they, with their protégés, had been driven away from the far West."

"But have they not become mixed with the whites?"

"So much so that, according to one of the professors in Toronto University, they will soon have to prove their Indian descent from the baptismal register. The professor

says he heard a French Canadian lamenting that although his family were most loyally French, yet they were fast becoming Hurons in physique; while, on the other hand, many of the Hurons are already closely resembling the French in their appearance. These facts would please old Brant, the Mohawk chief, if he were alive, for he always said that his people would become civilized only by amalgamation with the whites."

"I now recall the fact that Mrs. Schoolcraft, the wife of our distinguished authority on the Indians, was of Indian descent, and often accompanied her husband on his excursions to the Great Manitoulin Island in Lake Huron. By-the-way, whatever became of that project which Sir Francis B. Head (so lately deceased) commenced to execute about forty years ago—that of colonizing all the Indians on that island?"

"The experiment was tried for twenty years; but the Indians remained each year just long enough to claim their gifts and to barter them for liquor. This finished the project, for the island had acquired the name 'Dwelling of the Spirits' in more senses than one."

"Are the numbers of the Indians decreasing?"

"Not at all. On the contrary, after 250 years of warfare, they seem to be slowly increasing. Civilization has not brought the ruin and depopulation to them that it has brought to the natives of Australia and Tasmania."

Thus we found Xavier to be far beyond the average of his class not only in knowledge, but also in his readiness to express that knowledge in the English language.

But our evening was not entirely spent in this sober manner. Xavier's goodwife brought forth an immense *boudin*, or "blood pudding," and placed it by the fire, while Xavier himself produced from a cupboard a liquid of such a peculiar nature that we could not tell whether it was fermented or distilled. With many blessings the hospitable couple sent us off to bed, to dream

SHANS-KO-NAR.

of Indians with fiery tails, and of long men who peered in upon us through the small gable windows which lighted our room.

The next morning we decided to visit an Indian village, leaving Baptiste and his friend to visit together, and then to overtake us. Tying on our snow-shoes, we started forth. Let no one imagine that it is an easy thing to tramp when the feet are spread from fifteen to eighteen inches apart, and with such a *chaussure*, too! Even with the experience we had already acquired, we were not yet proficient in the art of waddling gracefully, for the peculiar motion required does not come naturally to those who live in a more southerly latitude.

As we trudged along we thought of the various hardships which the early Jesuit missionaries were obliged to undergo as they practiced with snow-shoes, and took their full share, with other beginners, in diving and plunging into the drifts.

We reached the Indian village, and were disappointed. Scarcely a soul appeared at the windows of the miserable cabins. At last we hailed an old creature; but we could not understand his *patois*, and so he shook his head, and we passed on until Baptiste overtook us.

We drove all that day, and occasionally drew our physical supplies from the depths of the calèche. Those were our *munitions de bouche*, after the manner of the old voyageurs. Toward night we entered a village of respectable size, and put up at the tavern, as tired as travellers could well be.

The next day passed without adventure, save that we came across an old trapper, with whom we managed to converse after a fashion. Curious instruments for trapping game dangled from his clothing, and gave a weird appearance to his spectral figure. Not knowing his name, we evolved one from our innermost memory, and called him "Shans-ko-nar," or "the moving shadow."

At length, before the third day of our journey had ended, the spires and turrets of Ottawa came in view. We passed by the beautiful fall, so graceful in its lace-like descent that it was not strange the early French called it the Rideau. A little farther on the grander falls of the Ottawa, named the Chaudière, were enveloped in an icy shroud. The constantly accumulating crystals of frozen spray had taken the form of strata, through which a small opening revealed the boiling waters of "the Kettle." Down they rushed and struggled and flew into and out of caverns and about the sharp corners of the rocks, their olive-green hue in marked contrast with the snow, and their reverberating echoes causing us to forget the extreme record of the thermometer as we paused to listen and to admire.

Aside from the novelty of the trip, we had come to Ottawa for the purpose of seeing the trappers, and gaining information about the fur trade. Imagine our disappointment when we discovered that more satisfactory knowledge might have been gained at our own firesides, since very little of the fur trade comes to Ottawa nowadays, and most of that little comes in the spring. We were so fortunate as to see two or three trappers; but the great bulk of both trade and trappers is at Winnipeg, in the region of the Red River of the North.

After all, our disappointment was only a surprise—the suddenly acquired knowledge of a fact hitherto unknown and unknowable. We therefore, with profound philosophy, addressed ourselves to the pursuit of still other of those pleasures which can be enjoyed only in this part of the world. Most of our time was spent at one of the rinks on the Ottawa River—for the word "rink" stands not only for a building on the land, but also for a fenced inclosure on the ice. Here we saw various Indian games adapted to the glassy surface. Less exciting, but more scientific, was the Scotch game of "curling"—a game in which his Excellency Lord Dufferin, the late Governor-General, often took a hand. He was an excellent player, and was fond of an occasional game with his subjects for a trivial stake, as a donation to some charitable purpose.

A MOONLIGHT TRAMP.

VI.—ROGER VANDER WEYDEN.

THE mantle of Van Eyck descended upon Vander Weyden, his pupil, and distinguished by the same qualities as was the first Flemish master. Vander Weyden is often called Roger of Bruges, and, as is inevitable in tracing out the lives of the early painters, two places contend for the honor of being his birth-place; in this instance Brussels and Tourney.

Vander Weyden was born in 1400. He was married in 1425 to one Elizabeth Goffaerts; but whether at this time his appointment to decorate the Town-hall at Brussels had been received or not can not be ascertained. From the size of his pictures for the Town-hall, and the faithful work he always bestowed on his pictures, the four must have occupied him some years, and it is likely he did other work for the city, though there is no direct mention of any. That he was a successful artist, as far as accumulating money is a proof, is evident, for in 1434 he was, by records, in receipt of rents from property owned both in Brussels and Tourney. In 1436 the city authorities decided that the expenses of government must be curtailed, and that they could no longer afford to pay for a city painter; and that though Vander Weyden should retain his title and office, he should no longer have a salary, and after his death the office should be abolished. What money he received from the authorities is not stated, and there is no record of any thing paid to him save an indemnity for the purchase of the robe required to be worn on state celebrations. In 1444 he bought a large house in what is now Emperor Street, which he left to his children, of whom there were four, three sons and a daughter. The gratuity of 400 crowns which he gave the Carthusians at Herinnes, when his eldest son Cornelius joined their order, is an additional proof of his being rich, as is also the fact that by his will he left a large legacy to be applied in aiding the deserving poor of Brussels.

ROGER VANDER WEYDEN.

In 1450 Vander Weyden went to Rome to join in the jubilee, and found his fame had preceded him, and that by the enthusiastic Italians he was ranked with Van Eyck. On his return he received a commission to paint an altarpiece for the Abbey St. Aubert at Chambray, but all trace of this work, which was highly esteemed in its day, is now lost.

He evidently led an uneventful, laborious life, and there are very few details that even the most patient research has been enabled to gather concerning him, and one of his best known claims to remembrance has been and will be the fact that he was the teacher of Memlinc and Martin Schongauer, or "Le Beau Martin," as the French term him, whose rare wood-cuts are now as highly prized as those of Dürer.

Vander Weyden died in June, 1464, and was buried before the altar of St. Catharine in the Church of St. Gudule, at Brussels, and this inscription was engraved on the stone which covered his grave: "Under this stone, Roger, thou liest quietly—thou, whose pencil excelled in reproducing Nature. Brussels weeps thy death, and fears she will never again find so skillful an artist. Art also mourns thee, deprived as she is of a master who never had an equal."

Vander Weyden's second son, Peter, was an artist of little merit, but his son Gosuin seemed to have inherited more of his grandfather's talent, and some of his pictures, notably the "Marriage of the Virgin," at Lierre, have been erroneously attributed to Roger Vander Weyden.

With the exception of the portrait of Philip the Good, at Antwerp, and a miniature which adorns the manuscript, "The Annals of Hainault," painted in 1449—of which Laborde says, "The painter has represented the duke seated on a dais receiving the work, and Vander Weyden was at that time the only artist able to conceive and execute such a masterpiece, worthy alike of his master and his hand"—there are but two authentic pictures of Vander Weyden's known to be in existence; all others attributed to him are conjectural. Both of these have gone through various perils by sea and land ere they reached their present havens. One is a triptych, now one of the ornaments of the Berlin Museum. The central panel represents "The Virgin holding the dead Christ;" on the right, "The Virgin and Child;" on the left, "The Resurrection, and Christ appearing to His Mother." As far

back as 1431 there is a record of this picture, so it must have been painted when Vander Weyden was young; but even then he had gained a reputation, for the old manuscript record in the Carthusian convent of Miraflores speaks of the picture as painted "by Master Roger, a great and famous Fleming." Pope Martin V. gave the picture to John II., King of Spain, and he in 1445 presented it to the convent. During the Peninsular wars, between 1800 and 1814, it was bought by M. Nieuwenhuys from some despoiler, sold by him to William II. of Holland, and at his death was transferred to its present abode. Waagen praises "the great energy of the conception, the vivid coloring, the delicacy of finish," though he condemns the lack of anatomy shown in the figures.

The second picture is at Madrid, and was painted by Vander Weyden for the "Chapel beyond the Walls" of Louvain, and a century later Maria of Hungary bought it of the Gunsmiths' Guild of that city (the owners of the chapel) for a copy by Coxie and organs worth 500 florins. The ship which conveyed the picture to Spain was wrecked during a storm, but the picture escaped uninjured. The subject is "The Descent from the Cross," and the painting justifies the high praise bestowed upon Vander Weyden by the old art critics, according to Michielis.

Of the four large works painted for the Town-hall of Brussels—"The Act of Justice by Trajan;" "Pope Gregory informed by a Vision of God's Grace to the Emperor;" "Herkenblad punishing his Son, convicted of Theft;" "The Last Communion of Herkenblad," of which Dürer, when he visited the Low Countries, spoke in eulogistic terms, calling the painter "the great Master Roger," and Lamponius, on seeing them, exclaimed, "O Master Roger, what a man thou wert!"—there is no record after the bombardment of Brussels in 1695, and it is generally believed that they perished then. Calvert of Estrella, who saw them in 1549, and Jacques Bollard, still later, wrote lengthy descriptions of them; and M. Pinchart has discovered that among the hangings captured by the Swiss from Charles the Bold at Nancy, still preserved at Berne, are reproductions of these famous pictures. The tapestries are twenty-six feet long, thirteen feet six inches high, and are said to be faithful copies of the paintings as described by Calvert and Bollard.

VII.—JACQUES JORDAENS.

According to Michielis, Jordaens has not received the praise he merits. He says: "No writer, no critic, has ever appreciated the character of his works. They have been praised in a feeble, vague way. No Frenchman has written his life, which is to me strange, for he is better represented in the Louvre than in any other gallery." He then describes the famous picture, "The Money-Changers in the Temple," and exclaims: "The power of Shakspeare breathes in this canvas; here one finds his depth and his bitter strength;" and gives Timon's soliloquy, where he finds gold—*Timon of Athens*, Act IV., Scene 3. Michielis also asserts that this picture was intended as a protest against Catholicism. Under the guise

JACQUES JORDAENS.

of the money-changers Jordaens represented the Simonaics and the papal court; the avenging Messiah is Luther overthrowing the Catholic clergy.

It is true Jordaens has not met with much notice; Rubens overpowered his pupils; they are merged in him, and, with the exception of Van Dyck, comparatively little attention has been bestowed upon them; in fact, in many of the accounts Jordaens is spoken of as being merely an "imitator" of Rubens. Jordaens resembles his master—for such Rubens was—more than any other of his pupils in the brilliancy of his coloring and vigorous execution, though he sometimes carries to extreme his fondness for glowing tints, as in the "Vocation of St. Peter" at Antwerp, which is startling in its vivid coloring.

Jordaens was born at Antwerp, May, 1593, of Catholic parents, and was the eldest child of a large family. His father was a linen-draper, and, like Rubens, our artist was "one of the people." When fourteen he entered Adam van Noort's studio; how long he remained there is not stated, but the registers of the brotherhood of St. Luke's show him to have become a member in 1615, and opposite his name are the words "water-painter." It was the custom in those days to hang rooms with painted linen draperies when the owner could not afford to purchase tapestries or Cordova leather, and Mechlin was the great market for such wares. Jordaen's father being in the linen business, and furnishing such stuffs brought

from Mechlin, was desirous to manufacture them at home, and intended to employ his son's talents in painting linen for him, which was why he had the young man taught distemper painting, but the son soon broke away from this purely mechanical branch of art.

Adam van Noort* was a man notorious for his brutality and vicious ways; his pupils were always glad to leave him, but Jordaens, as a recompense for the abuse he suffered at the hands of the father, was consoled by the tender love of the daughter, and he and Catharine van Noort contrived to meet after he quitted her father's studio. On the 15th of May, 1616, the young couple were married, and in consequence Jordaens was obliged to relinquish a journey to Italy which he had intended to make. He always regretted that he could not have studied in Italy, and the few who have criticised him have repeated the remark, except Michielis, who says, "I do not see wherein this Flemish artist could have gained by a residence in the papal domain; he would have returned less liberal, less original: his style seems to me perfect."

Jordaens had three children, two daughters and one son, the records of whose baptisms can be seen in Notre Dame, the last bearing date October 25, 1629, showing at that time the painter was still a Catholic. The precise date at which he became a Protestant is rather obscure, but it must have been some time between October, 1629, and July, 1630; for this reason: Gustavus Adolphus, wishing to have twelve paintings representing the "Passions," and being a zealous Protestant, ordered the works of Jordaens, on the twofold ground of his being a great painter and also a Protestant. Now, though Gustavus did not die until November, 1632 (on the field of Lutzen), yet it was on the 4th of July, 1630, that he embarked from Rugen with his troops to fight against Wallenstein, and it is scarcely possible that during that eventful struggle the king had time to bestow thoughts upon painters or paintings.

Jordaens painted as rapidly as Rubens, and was as diligent a worker; according to Weyerman: "His brush was so skillful that he filled with his pictures not only Belgium and Holland, but the neighboring countries, which caused them to be less valuable, for rarity enhances the value. In order to give a list of his pictures a volume would be necessary."

Even if their number diminished their value, Jordaens's pictures brought him in a large fortune, for in 1639 he bought a house in High Street, now numbered 2593, which he remodelled after a design of his own, spending two years in the reconstruction. The entrance hall was in the shape of a Greek cross, on the walls and doors of which Jordaens painted pictures, among them the twelve apostles, the signs of the zodiac, etc. There were many pieces of sculpture and pictures by other artists, and the house was

"THE FAMILY CONCERT."—[JORDAENS.]

* A portrait of Adam van Noort, painted by Van Dyck, was given in the paper on Van Dyck in *Harper's Magazine* for July, 1878.

ERASMUS QUELLYN.

intended to equal, if not excel, Rubens's. In 1708 the house was sold by Jordaens's grandchildren. One of the purchasers, Van Heurck, owing money, gave in lieu the larger number of the pictures, which now ornament the Gunsmiths' Hall. Since then the house has so often changed hands and been so altered that there now remain no traces of its former splendor. Jordaens's collection—a valuable one—of other artists' pictures was sold at the Hague in March, 1734.

Though a swift, steady worker, Jordaens gave his evenings to enjoyment, and generally spent them with friends at a tavern, and it was from the habitués of the inn that he obtained his models. After the death of Rubens he was the recognized head of the artists; and Gerbier, writing to Murray, the keeper of Charles I.'s pictures, says, "Sir Peter Rubens is deceased three days past, so Joardens remaynes the prime painter here."

The widow of Frederick Henry, Stadtholder of Holland, commissioned Jordaens to paint in the Maison au Bois, near the Hague, the history of the great general, intending to have a gallery equal to that which Rubens executed for Marie de Medicis; and doubtless the religious belief of the painter was an additional reason for his employment, for the princess in the decoration of the rest of the palace had only Dutch painters. Jordaens was the only stranger. His eminent position saved him from the petty persecutions that the Protestants underwent in the Netherlands; his house was always an asylum for those who needed protection, and every year he had the wedding feast at Cana celebrated with great pomp.

Jordaens lived to be eighty-five, and died in 1678, on the same day with his daughter, of the epidemic called "the sweat."

VIII.—ERASMUS QUELLYN THE ELDER.

Under a portrait in the *Golden Cabinet* is this inscription: "Erasmus Quellyn, born in Antwerp, November 19, 1607; he was a pupil of Mons. P. P. Rubens, having first

"YOUTHFUL SATYRS."—[E. QUELLYN.]

been a professor of philosophy; he was also an excellent master in painting both for large and cabinet pictures; he studied perspective assiduously, and was also a fine designer and architect."

It seems that Quellyn turned from philosophy and the pursuit of abstract subjects to painting, attracted thereto by the genius of Rubens and the affection he had for the great Fleming, at whose houses he was a constant and welcome visitor. The great master, however, did not teach his friend the rudiments of his new profession, and Quellyn first entered the studio of Verhaeghe, an obscure painter but excellent teacher, remained there a year, and in 1634 was admitted into the Guild of St. Luke, of which his father, a sculptor, had become a member the day of his son's birth.

Quellyn married a rich wife, painted for his pleasure, not for his support, and it was at first owing to Rubens's persuasions that he exhibited and sold his works. The friendship between the two artists remained unbroken, and each estimated highly the other's genius. Quellyn decorated several churches, and St. Michael at Antwerp held many of his works. Michielis declares his paintings bear comparison with those of the great masters without excepting one, and mentions with great praise an "Adoration" at Munich, in the cathedral; a "Holy Family" at Ghent; and the famous picture at St. Jacques, Antwerp, illustrating the story of "St. Roch," once so familiar (and which Mrs. Jamieson relates in her *Sacred and Legendary Art*), bearing date 1630, which was evidently painted in commemoration of the fearful ravages of the plague, which raged in Antwerp from 1658 to 1631.

Whenever there was any celebration at Antwerp, Quellyn was the one to design the triumphal arches, etc. And on the entrance of Castelroderigo, Governor of the Netherlands, the wedding of Louis XIV. and Maria Theresa, the death of Philip IV., Quellyn painted descriptive pictures of these scenes, all of which have been engraved. After the death of his wife, Quellyn entered the monastery at Tongerloo, and there staid until his death, November 11, 1678, at the age of seventy-one. Michielis thinks that a large number of his works have been attributed to Van Dyck, their styles being similar, and that careful investigation would disclose many of his pictures now unknown; that as he was a patient, persistent worker, he must have painted many more works than are recognized as his, and though it is surprising his merits should have been so long overlooked, yet it is in part owing to his often omitting—in fact, rarely remembering—to sign his name to his pictures.

IX.—FRANZ SNYDERS.

It is not without justice that Michielis complains of the "desperate laconicism" of the Flemish writers, and says, "It seems sufficient to them to give a few dates and note a few events; but the feelings, the moral characteristics of the artists, the details of their daily life, their joys, their sorrows—all one would like much to know—seem to them of no interest, and on these points they all preserve an obstinate silence."

FRANZ SNYDERS.

Of Snyders there is but scant information. We learn that he was born at Antwerp in 1579, two years after his famous master and friend Rubens. He studied his art under Pierre Breughen, and later of Henry van Balen, and in 1602 was elected a member of the Academy of St. Luke, which fact shows that even then he was an artist of merit. He was speedily chosen by Rubens to paint with and for him, and in many of Rubens's compositions the animals are by Snyders, and in the latter's hunting pieces Rubens painted the figures. Rubens at his death appointed Snyders, together with Jean Wildens and Moermans, to appraise his pictures and take charge of and sell them.

As far as is known, Snyders never travelled out of the Netherlands. The rumor that he studied in Italy under Castiglione, and there acquired his style, is a mistake, for Snyders was thirty-seven when the Italian artist was born, and certainly did not wait until past middle life to copy from Castiglione. Ere the Italian had acquired any fame, Snyders had been nominated court painter by the Archduke Albert, who admired his works, and presented several of them to Philip III. of Spain, and they now adorn the palace of Buen Retiro. Leopold of Austria was also a firm patron of the painter, and his pictures were eagerly sought after.

He was accounted the best animal painter of his day; and Blanc asserts that his

"THE BOAR-HUNT."—[FRANZ SNYDERS.]

"chases are executed with a vigor and fire that Rubens alone could equal. The abounding life that Rubens depicted in his men and women, Snyders has depicted in his animals. He transports us to the open country, to the full chase; the prey and the dogs are the actors. We can imagine, so vivid is the representation, that perchance the panting fugitive will escape the cruel teeth of his pursuers and the knives of the hunters." Yet Blanc allows that Snyders was often faulty in his perspective and in the "clair-obscur," frequently careless in the disposition of his groups, and taking no pains to throw the light on the central point of his picture and subordinate the rest; but spite of his faults, Snyders's works are full of "the movement, the warmth, and the breath of life. 'Tis these qualities which gained him the greatest honor desired by the painters of his day, the admiration and love of Rubens."

Weyerman contends that the best pictures of Rubens and Snyders were those they painted together; but this is extravagant praise of Snyders. Though his pictures possess the same qualities as those of Rubens, yet he is not the great painter's equal, for his colors are harsher, less harmonious, and his shadings are more abrupt. In later years Snyders returned to the painting of fruit, flowers, and game, with which he began his career, but his best works are his animal pictures. He is known to have executed sixteen etchings representing animals, which are of very great rarity, and a few of his paintings have been engraved by Zaal and Réveil. Snyders died in 1657.

EDUCATION BY HAND.

WHEN Benjamin Franklin made his will, in 1788, he inserted a provision by which the sum of one hundred pounds sterling was to be put out at interest, and the earnings of the money devoted each year to the purchase of silver medals to be given as honorary rewards in the free schools of Boston. "I was born," he says, "in Boston, New England, and owe my first instructions in literature to the free grammar schools established there." The investment has proved very productive. Not only has the fund more than doubled since Franklin's death, but over four thousand boys have received, in token of diligence and exemplary conduct, the Franklin medal, and every year hundreds have before their eyes this old-fashioned prize, worth perhaps a dollar if sent to the mint, but constituting the symbol of a boyish aristocracy of merit and scholarship. The schools which Franklin remembered with gratitude have increased in number and appointment, until the system of Boston public schools has become a great organization, occupying the attention and thought of teachers, supervisors, superintendent, and a citizens' committee, and watched over with interest and solicitude by all who have the welfare of the city at stake. The same spectacle is seen in all

parts of the country, and there is little doubt that were Franklin alive to-day, he would give his shrewdest observation to the common schools of America.

There was another interest which Franklin had much at heart. The Library Company of Philadelphia, of which he was one of the founders, became in his lifetime, as he said, "the mother of all the North American subscription libraries;" but Franklin and his contemporaries had no conception at that time of the free public library, which has outstripped the subscription libraries, and divides with the common schools public interest and concern. If he could visit his native place now he would find, in place of the few facilities which he describes so pathetically in his autobiography, a collection of books, the largest in America, free to all boys and girls in Boston. He would not be surprised to learn that it was popularly regarded as the cap-sheaf of the public-school system.

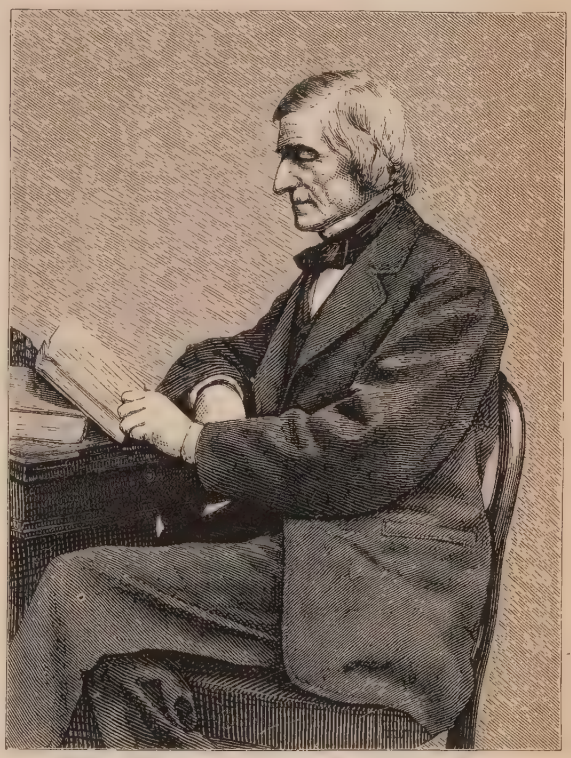
Marvellous indeed has been the increase, even within one generation, of the literary appointments of education. Text-books have been refined upon, systems of teaching and of examination have been studied, discussed, made the subject of learned treatises and solemn commissions, and the whole science of pedagogy has been subjected to the minutest scrutiny. Grades have been regarded, discipline established, and the public-school system invested with something of the mechanism of a rigorously ordered army. From primary school to high school the child is pushed from behind and pulled from before, and all manner of rules and regulations hedge him about. Great sums of money are expended, and so far is the solidarity of the school carried, that associations exist for perpetuating the company which has been brought together in this or that grammar school or high school. During the hours not spent in school, and especially upon the half-holiday, the Public Library is thronged with pupils searching for books to read at home, or crowding about the tables where the current literature offers immediate attraction. Surely one would expect from this highly organized literary system a community, if not of Franklins, yet of intelligent, prosperous citizens capable of using their wits, and, within the necessary limits, what one might call an educated class.

But if Franklin could inspect all these appointments, and could be present when the ingenuous youth came forward to receive the medals which his hundred pounds had provided as a perpetual incentive, I suppose his next questions would be, What has become of the thousand pounds which I gave at the same time for the benefit of apprentices? and where are the young married couples who are using it? For in the codicil to his will, dated a year afterward, is this clause:

"I have considered that, among artisans, good apprentices are most likely to make good citizens, and having myself been bred to a manual art, printing, in my native town, and afterward assisted to set up my business in Philadelphia by kind loans of money from two friends there, which was the foundation of my fortune, and of all the utility in life that may be ascribed to me, I wish to be useful after my death, if possible, in forming and advancing other young men that may be serviceable to their country in both those towns. To this end I devote two thousand pounds sterling, of which I give one thousand thereof to the inhabitants of the town of Boston, in Massachusetts, and the other thousand to the inhabitants of the city of Philadelphia, in trust, to and for the uses, intents, and purposes hereinafter mentioned and declared." The sum thus bequeathed to Boston was to be let out upon interest at five per cent. "to such young married artificers, under the age of twenty-five years, as have served an apprenticeship in the said town, and faithfully fulfilled the duties required in their indentures, so as to obtain a good moral character from at least two respectable citizens, who are willing to become their sureties." Sums not exceeding sixty pounds nor less than fifteen were thus to be let out to applicants, and Franklin anticipated that as the principal increased it would be borrowed on similar terms by other towns in Massachusetts. He provided, moreover, for the increase of the fund by establishing that at the end of one hundred years, when, as he calculated, the fund would amount to £131,000, £100,000 were to be expended on public works, and the remainder again used as before for another century, when a final distribution was to take place of the accrued $4,610,000, which, by Franklin's arithmetic, would then be at the disposition of the trustees.

This fund has been accumulating, the amount on the 1st of February, 1878, being $229,726 40, and at the present rate of interest the amount anticipated by Franklin will very nearly have been reached in 1892. But the immediate use by the persons for whose benefit the fund was established is very small, at the last account only nine persons availing themselves of it; for the conditions imposed by Franklin had regard to a state of things fast disappearing. When he was a young man, and apprenticed, he knew how far a few pounds would go in starting one in business; but where are we to find now "young married artificers" in Boston, who have served as apprentices there, and can find sureties for a loan of $300, one-tenth of which, with interest, is to be repaid annually? Where are the apprentices?

THE INSTITUTE OF TECHNOLOGY, BOSTON.



The old system of apprentices required a boy to be bound to a master for a term of years, during which time the master was to board and clothe him, to teach him his trade, and to give him such other education as was possible; in return it was expected that the apprentice would spend the last part of his term in labor which would remunerate the master. The ideal master kept the apprentice in his house and treated him as one of the family; the ideal apprentice served his time faithfully, was obedient to his master, and learned thoroughly his trade. But this has all changed. One still finds apprentices here and there, but the system has disappeared. The greater subdivision of labor, consequent upon the introduction of steam-power; the increasing luxury of the master, separating him from the apprentice by greater social distance; "the existing constitutional aversion of the race to being bound to any body to do any thing"—these and other changes in our more complex society have caused the system to melt away. In place of it we can only say that children remain longer at the public schools, and then pick up their knowledge of trade almost fortuitously. The ranks are partly filled by foreign workmen, and mechanic employments are avoided if possible. So it is that skilled workmen in any trade seem to be fewer and fewer, while half-educated young men are clamoring for places as clerks or salesmen.

Franklin did not foresee this condition of things. He never dreamed that in his native city a great public library would be resorted to by crowds of school-children set free from an elaborate system of education, and that the mechanic arts would go begging for workmen capable of building thoroughly the houses in which the school-children were gathered, of making the desks at which they sat, and of printing the books which they read. All attentive observers have been aware of this change, and about ten years ago a committee was appointed by the Massachusetts Charitable Mechanics' Association—the highest representative body of the class—to consider the relations of apprentices to their masters, including the decay of the apprentice system. I only notice this report for a single point. It takes up the suggestion of one of the members that a mechanical college would cure the evil, and disposes of it by two considerations; first, that this could be possible only with the very simplest trades, and then that it would not be practicable to dispose of the articles made by the students who were learning the trades. In the wide diversity of occupations, and in the fact that labor was greatly subdivided, seemed to lie an insuperable objection to any systematic instruction in trades at an educational institution; and then suppose, for example, that watch-making were to be taught at such a school, how expensive the educa-

tion would be, and how unmarketable the product!

When this committee reported, there had already been in operation in Boston for five or six years a technological school — the Massachusetts Institute of Technology — which, in common with similar schools in other parts of the country, was trying in its own way to bring education distinctly to bear upon the mechanic arts through the application of scientific methods. It had long been shown that the very simplest occupations of industry — agriculture, that is, and the mechanic arts — exacted a knowledge of chemical and physical science before they could be pursued with intelligence and success, and that the old empirical methods must give place to scientific laws. The Institute was established in part for this purpose, and began at once to operate upon a broad basis, the scheme of which was mainly laid down by the eminent Professor William B. Rogers, who was the first president of the Institute, and, though soon compelled by ill health to resign that office, has always been an active member of the corporation. He has recently resumed the position of president. In this scheme schools were to be established in Mathematics, Design, Physics, Chemistry, and Geology. These schools have since been more minutely subdivided into courses in Civil and Topographical Engineering, Mechanical Engineering, Geology and Mining Engineering, Building and Architecture, Chemistry, Metallurgy, Natural History, Physics, Science and Literature, Philosophy. Indeed, the practical development of the school has gradually caused it to broaden its scheme and to aim at a comprehensive preparation for active life — a combined collegiate and professional school, with the omission chiefly of the ancient languages.

In so far as the Institute agrees with similar schools, I do not purpose to describe it, but to point out a certain special work which it has undertaken first in this country. The steps by which it reached the interesting experiment it is now carrying on are worth noticing, especially as they indicate characteristics of the school almost peculiar to itself. Every one familiar with the development of the methods in teaching chemistry is aware how much greater part the laboratory plays in instruction than formerly. Once a class listened to lectures, and saw them illustrated by experiments performed in their presence by the teacher of the class; gradually special students were admitted as assistants in these experiments and in the laboratory; then it became evident how important to the student was the actual performance of the experiments by himself; now the experiments, the tests, and the working out of problems begin almost immediately upon the presentation of the elements of the study, and constitute a very large share in the course of chemical study, so that wherever the science is taught thoroughly, provision is made for the entire class, together or by sections, to perform laboratory work. By this means a sharper impression is made of the principles, and the student, whether or not he ever becomes a professional chemist, understands chemistry with a precision and intelligence unknown under the old system.

WILLIAM B. ROGERS.

The inexpensive character of materials for illustration in chemistry has rendered this method a familiar one, but there is nothing else in the science which serves to separate it from other and cognate ones in the employment of the manipulatory method. To the Massachusetts Institute of Technology belongs the credit of introducing the

same method in other departments, which had hitherto depended, as chemistry formerly did, upon text-books, lectures, and the spectacle of experiments. The discovery that this method was practicable was not an accident, but the legitimate result of applying the principles laid down lucidly by President Rogers in "Objects and Plan of an Institute of Technology"—a pamphlet issued when the school was first proposed. The following paragraph taken from that pamphlet indicates how well the author grasped an idea not before put into practical operation:

"In this laboratory it is proposed to provide implements and apparatus with which the student may be exercised in a variety of mechanical and physical processes and experiments. Thus he may learn practically the methods of estimating motors and machines by the dynamometer, of experimenting on the flow of water and air or other gases, and of testing the strength of the materials used in construction. He may become familiar with the adjustments and applications of the microscope, be practiced in observing with the barometer, thermometer, and hygrometer, and, in a room fitted up for photometry, may learn the mode of measuring the light produced by gas and other sources of illumination, and the value of different kinds of burners, lamps, and their appendages."

To Edward C. Pickering, for ten years Professor of Physics at the Institute, and now at the head of the astronomical observatory of Harvard University, belongs the credit of carrying out into regular class-work the plan suggested by President Rogers. Under his direction a laboratory was fitted up, and experimental work made a constituent part of the student's work. *The Elements of Physical Manipulation*, published by this author, contains in detail the work of the laboratory, and is, indeed, based on the manuscript directions to students in performing their various experiments. Professor Pickering's own estimate of the value of the course pursued is one of emphatic confidence. "A student," he says, "accustomed to learn merely from books acquires a new knowledge of physical phenomena when he himself proves the correctness of theoretical laws by actual experiment. Facts thus learned are also far more easily remembered. An interesting feature of this method of teaching is the rapid improvement, especially with classes that have had no previous laboratory practice. Such a class during their first hour accomplish almost nothing, and almost discourage both themselves and their instructor; the next hour shows an improvement, and before many weeks experiments are readily performed without question which at first were quite unintelligible to them." As a more definite statement of the application of this method in the work of the more advanced students, I quote one further passage from a report made by Professor Pickering when he closed his connection with the school: "The students in civil engineering and architecture devote two hours a week to work in the physical laboratory for half of their fourth year. The work during the present year serves as a type of that previously done. This year two students planned and built a truss of a form suitable for a roof, and measured its change of shape under various loads. It finally broke under three hundred pounds, while the bars of which it was formed would not have borne a tenth part of the weight. Others studied the laws of continuous girders, and compared the deflections with those given by theory; others tested a water motor, measuring the flow, the pressure, the work done, the speed, and other elements, and from these computed the efficiency; others, again, measured the strength of wires, the force required to strip a nut off a bolt, and compared the effect of impact, as in a pile-driver, with a dead-weight. In former years several excellent models of bridges have been built by students, and these are now used for tests of change of form with varying loads, and for other purposes." This statement, it is true, applies to the study of professional physicists, but the course is based upon the previous experimental one which aims at general culture. The same principle which applies to professional education is regarded in the study of general students, on precisely the same ground, it may be said, that drawing constitutes a means of general culture, while on the basis thus laid is built the professional work of the artist. The brilliant success attending Professor Pickering's development of physical manipulation as a means of teaching physics has led to the introduction of the system elsewhere.

Now leaving those departments, like chemistry and physics, where the introduction of the system of laboratory work may be regarded as mainly for the purpose of illustrating and fixing theory, there are others in which such work seems to have a more directly economical value, and no considerable demonstration is required to make clear the value of experiment as a part of the student's education. The courses in civil engineering and architecture have already been referred to as receiving benefit from the physical laboratory, and here the advantage is obvious. The student who takes the course of mechanical engineering, besides entering the physical laboratory, is provided also with a mechanical laboratory, fitted with steam-boilers, superheaters, engine, calorimeter, indicators, pressure gauges, thermometers, an accurately constructed mercury column, and all the usual apparatus for

producing and using steam and for testing its nature and action. This apparatus is handled by the student as a part of his regular work in connection with his studies, precisely as in chemistry and physics he goes into the laboratories and confirms his theoretical knowledge by manipulation. The student in mining and metallurgy, in connection with the usual lectures illustrated by models, is sent into laboratories where he has the practice of working of ores in quantity, and on a small scale subjects them to the same modes of treatment as have been adopted at the best mining and metallurgical establishments. The apparatus for this purpose is extensive, and permits full illustration of all important processes. A sufficiently large quantity of ore is assigned to each student, who first examines it for its component minerals, sorts and samples it, and determines its value and character by analysis and assays, and makes such other preliminary examinations as serve to indicate the proper mode of treatment. He then treats the given quantity, makes a careful examination of the products at each step of the process, ascertains the amount of power, water, chemicals, fuel, and labor expended, wherever practicable, and thus learns approximately the effectiveness and economy of the method adopted. Each student is assisted in working his ore by his classmates, who have an opportunity in this way to run the boiler, engine, machines, and furnaces; and the whole work is carried on under the immediate supervision of an instructor, so that no student is allowed to experiment idly, but all his work is a direct educative process.

In all these respects, in laboratory instruction in physics as a part of the required course of each candidate for a degree, in architecture, in the mining and metallurgical laboratories for the working of ores in quantities, and in the laboratory for teaching the nature and use of steam, the Institute claims to have led the way. The system involved runs through all practicable courses, and rests upon the doctrine that the education of the hand is co-ordinate with the education of the mind. The application of this doctrine in chemistry was early made, and shown to be most economical both to teacher and student when carried on in classes. Physics followed chemistry, and in any scheme of technological education these two sciences would be regarded as necessary bases both for general culture and for professional knowledge. The steps naturally followed by which the same method was applied to professional studies in architecture, mechanical engineering, civil engineering, mining, and metallurgy. Here more time would be expended upon head-work and less upon hand-work. What if we were to go back to the rudimentary education? What then would be the natural relation of hand-work and head-work? Plainly, as the faculty of observation precedes that of reflection, the student in the earlier part of his course would use his hands and his eyes more—that is, would give a larger proportion of his time to any manipulatory work than in the later processes.

Now, after this examination of a school which recognizes the relation of hand-work to head-work in its various courses, and has carried the system in directions hitherto untraversed, I return to the questions with which the paper opened. Does such a course meet the practical difficulty presented of a decline in the mechanic arts? If the apprentice system is fading out, does such a system of technical education take its place? In a degree the systematic study of technology arrests the decline in the mechanic arts by bringing into the complex order of modern manufacture a trained intelligence capable of discovering new applications of scientific laws, and of taking advantage of unexpected changes in conditions of material life. The system, too, helps to determine more rapidly than apprenticeship could the aptitude of the individual for the higher technical pursuits, although under both systems mastership is necessarily determined in great part by moral considerations.

So then, while the apprentice system furnished the skilled mechanics, and out of this body rose, by selection, the master mechanics, the technical education furnished by such a system as I have outlined tends to the higher education of the mechanic and to discourage the common artisan. The apprentice system can not be revived; the technical education does not make the body of ordinary mechanics. From what source, then, are we to look for them? The trades themselves, so far from encouraging learners, rather slam the door in the face of those who ask admission; the public schools give a mental training which ought to make one a better workman who waits until he has passed through them before applying himself to an art, yet the public schools foster also a disinclination to manual labor, and the boy who has figured colossal fortunes in his arithmetic examples is more eager to make the same through the commercial transactions which those examples suppose than by the patient labor and economy of a wage-receiving workman.

I have asked this question persistently, because I think the answer is at hand, not yet conclusively shown, but with great probability, and it comes with propriety from the very Institute which we have already seen to be active in its trial of new methods in scientific education. That the Institute has found the answer has been in this case, also, no hap-hazard or fortuitous circum-

stance, but the result of a concentration of interest upon this very subject. The Institute has an impersonal sound: let me now substitute with justice the name of the late president, Mr. J. D. Runkle, who has been the enthusiastic organizer of the new system which is now on trial at the Institute. He considered that the establishment of the school originally through the appropriation to it by the State of funds derived from the sale of public lands by act of Congress in aid of instruction in agriculture, the mechanic arts, and military science and tactics, rendered it eminently proper that the Institute should expend its greatest force upon instruction in the mechanic arts. Agriculture was already provided for by the State Agricultural School, and military science and tactics formed a regular part of the instruction in both institutions. The whole plan of the Institute, including as it does a society of arts, a school, and a museum, lent emphasis to this view of the function of the school, and he watched with special care experiments carried on in this direction in other parts of the country. It was with this in mind that he went to Philadelphia, in company with other officers of the Institute and with a large portion of the students, and visited the Exhibition in 1876. There he saw what he at once felt to be a practical solution of the most important problem of practical mechanism for engineers. The question as he put it to himself was, Can a system of shop-work instruction be devised of sufficient range and quality, which will not consume more time than ought to be spared from the indispensable studies? And the answer which he found in the exhibit made by the Imperial Technical Schools of St. Petersburg and Moscow—consisting entirely of collections of tools and samples of shop-work by students—seemed to be an affirmative.

"The Russian system," in Mr. Runkle's words, "is a fundamental analysis of the problem of practical mechanism, and consists in teaching the theory and use of tools to classes of students in the same orderly and progressive way in which any other subject is taught, with the same supervision and instruction of a specially qualified teacher holding each student to the same account, and giving him the same credit as in other studies." It would be possible to give in detail the history and practice of the system where it has been carried to its best results, in the school shops of Moscow and St. Petersburg; but since the system has been incorporated with the Massachusetts Institute of Technology, I content myself with a statement of its operation there. Apart from the opportunity given to mechanical engineers to acquire manual instruction, there is a regular two years' course in the School of Mechanic Arts, the students in which—coming, say, at the age of fifteen years—are required to pass an examination in arithmetic, including the metric system, geography, spelling, punctuation, English composition, and American history. A table of the two years' course will assist the reader in understanding the aim of the school:

FIRST YEAR.	Number of Exercises.	Hours per Week.
Shop Instruction	120	12
Algebra (first half of the year)	75	5
Plane Geometry (second half)	75	5
English Language	90	3
Mechanical Drawing	90	8
SECOND YEAR.		
Shop Instruction	120	12
Algebra finished (first half)	45	3
Solid Geometry (second half)	45	3
Elementary Physics	60	2
English	90	3
Mechanical Drawing	90	8

By reference to this table it will be seen that in each year twelve hours a week are given to manual instruction, eight hours to mechanical drawing, and the remainder, thirteen and eleven respectively in the two years, to mathematics, elementary physics, and English. The training of the hand holds the larger place. Now let us see in what this shop instruction consists. It will help us, to understand, first, that it is not designed to instruct one in trade, but in art; that a graduate of the school is a carpenter or founder only as a graduate of a law school is a lawyer. The law student must still acquire the practice of law in the courts, as a student who has completed his course here in mechanics is equipped with principles, and so familiarized with the alphabet of mechanism; he is then able to apply his knowledge in construction. But in learning these principles he has learned them through his fingers as well as through his brain.

The Institute has provided a one-story building for its school shops, in one portion of which, by-the-way, is an apartment fitted up for the interesting woman's chemical laboratory now in successful operation. The art courses are as follows:

In Wood.	In Iron.	In Textiles.
1. Carpentry and Joinery.	1. Vise-work.	1. Designing.
2. Wood-turning.	2. Forging.	2. Pattern-weaving.
3. Pattern-making.	3. Foundry-work.	3. Dyeing.
	4. Machine-tool-work.	

One course will suffice to explain the process of instruction, and I take that in vise-work, as having been most fully worked out. It was the first to be established, and has thus had the longest trial, so that results can be more confidently affirmed of it. Of its practical character, it is enough to remind the reader that it applies in the trades of blacksmith, tool-maker, gunsmith, die-sinker, iron-mould-maker, lock-smith, machinist, tinsmith, brass-finisher, jeweller, and of the makers of philosophical, nautical, musical, and engineering

instruments. The shop contains four heavy benches, each eighteen feet long, and to each bench eight vises are attached. At each vise there are four drawers, each large enough to hold all the tools needed by the student at any one time, so that the shop is equipped for four sections of thirty-two students each. Thirty-two is as large a class as a single teacher can properly instruct.

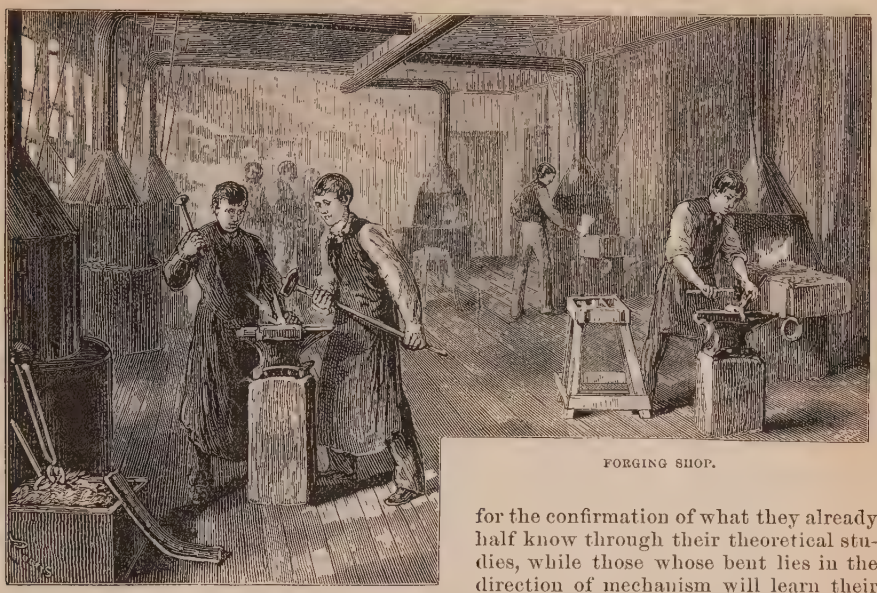
To recur again to what has been said in another form: the students are not taught the trades of blacksmith, tool-maker, etc., but they are taught the fundamental processes which apply in vise-work to all these trades. These processes are filing, chipping, sawing, scraping, breast-drilling, tapping, etc. In learning to use the tools required the students are furnished with typical forms, carefully provided and arranged to exhibit the progressive steps of the art.

THE DRAWING-SCHOOL.

His attention is given not to constructing a piece of work, but to studying the processes by which a whole class of similar work is constructed, by means of a typical form. In performing his work the student is supplied with the necessary tools required from time to time—files of various degrees, hack saw, file card, squares, calipers, and cold-chisels. The first course in vise-work, which includes filing, chipping, and sawing, consists of thirty lessons of four hours each, three lessons per week. A series of twenty-two designs is prepared, graded from filing to line in cast iron to free-hand filing with hand-vise, the material being steel wire.

The arrangement of the series is made with reference to the educative value of the steps taken. The student having learned one process, is not kept at work repeating that, but is led forward to the next process based upon that which he has acquired. Herein lies the marked difference between the education which the student receives in such a school and that which he receives in a shop—a machinist's shop, for instance. There, once he has learned to do a thing well, he is kept at work upon it, because his labor is useful to his employer; here, once he has learned a process, he is advanced another degree, because his education, and not his availability, is the primary consideration. The master's work is like that of a teacher in drawing—moving about among the pupils and correcting defects of method and practice. His inspection of the work done must be the means of determining the progress and success of the pupil; and here has been introduced an ingenious and notable scheme for determining with great exactness the results in each case. An analysis is made beforehand of each piece of work to be done, and certain points established, which determine the several qualities of the student's execution, and these points are posted, that the student may know what excellence he is to work up to. For example, the first piece of work given the class is a rectangular piece of cast iron, which is to be filed to line. Each student has for use a ten-inch hand bastard file, a ten-inch hand second-cut file, an eight-inch hand smooth file, and a four-and-a-half-inch try square. The design of the task is to teach the use of the three large coarse flat files only, as they follow each other in obtaining a plane surface; and at the same time not only the use of these tools is taught, but the utmost care and accuracy of finish are required: the files are like the pupil's pencils in mechanical drawing; the excellence of his work is in its precision. The inspection of the work is based on this analysis:

Point No. 1.	Filed to line on one side ...	20 per cent.
" No. 2.	Filed to line on other side..	20 "
" No. 3.	Filed straight lengthwise...	20 "
" No. 4.	Filed straight crosswise....	20 "
" No. 5.	No cross-marks	20 "



The student, in this case, sees that the five movements, so to speak, by which he executes his task are equally important, and his work is judged in detail by the perfection which he has attained in each point. This is a very simple illustration, as it is the first step in a series. The first lesson in the shop has been taken, and a single piece of work completed. If we take the student when he has had fifteen lessons, extending over five weeks, we find that he has passed from filing to line to templet-work, sawing and filing to free-hand filing, and now has reached the fourth general division, that of fitting. Here he has a piece given which will occupy him a week—three lessons of four hours each.

Finally, the last exercise in the course, requiring five hours, is to make a screw from steel wire, and the tools given him are a hand-vise and calipers and these files: ten-inch hand second-cut, five-inch half-round smooth, five-inch three square, six-inch half-round superfine, seven-inch hand superfine. The analysis is made up of six points:

Point No. 1.	Threads equal distance apart.	30 per cent.
" No. 2.	Threads of equal depth	30 "
" No. 3.	Point in centre	10 "
" No. 4.	Threads not to lean either way	20 "
" No. 5.	Sides of threads straight bevelled	5 "
" No. 6.	No bunches or grooves	5 "
		100 "

Now in the selection of pieces of work regard is had to a regular progression in elaborateness, each process built upon the previous series, and at the close the student has to show twenty-two pieces of work as specimens of his skill. He has become familiarized with the use and powers of twenty-nine different tools of fundamental value; and through the whole he has, by these analyses of his work, been steadily and scientifically trained in the perfection of parts and in the relative value of all the processes of his work. The inspection is ostensibly to establish the rank of the student's work, but its greatest value is in constantly keeping before the student an absolute standard of perfection, and in opening to him the perfect parts which make up the whole.

The same principles of a progressive series and an analytical inspection are carried out in the other shops, and by this means there is a concentration of educative force just where it is most required in the mechanic arts, training the eye and the brain and the hand at one and the same time to patient, intelligent, economical, and skillful labor. Moreover, the tasks upon which this energy is expended are typical tasks, which disclose the grammar of mechanics, and furnish the student with a basis of observation upon which to erect afterward substantial theories and computations. The apparatus in connection with the shops is especially valuable, as it comprises a unique collection of models

FORGING SHOP.

sent to the school by the directors of the imperial school at Moscow. These models are exquisitely finished, and a number of them have peculiar value as displaying upon an enlarged scale the construction of instruments, and serving admirably to explain the direction and the angles of the incisive portions of instruments.

In describing this school of mechanic arts at the Institute of Technology, with its two years' course and its forty-five students, attention has been called to it as a distinct department, but the fact should not be overlooked that the school shops, which form so important a feature in the instruction given, are open to the students in the regular full courses of the Institute. Just as the student in chemistry has recourse to the chemical laboratory, the student in civil engineering, mechanical engineering, and mining engineering to the physical laboratory, so the student in mechanical engineering, besides his mechanical laboratory, where he practices in the nature of steam, uses the shops for practice and study in the nature of metals, and the student in architecture for practice and study in metals and wood. As a matter of fact, the great majority of students belong to the special school of mechanic arts. Out of forty-four named in a recent list, thirty-two are from this school, six are students in mechanical engineering, and six from other engineering courses. The natural discrimination would be made by and among students that those who aim at the position of a mechanical engineer will pass more rapidly over the manual course, using it, as intellectual men will use a manual exercise, for the confirmation of what they already half know through their theoretical studies, while those whose bent lies in the direction of mechanism will learn their lessons mainly through the finger-tips; yet the discovery is made here, as in so many other cases, that the boy who seems incorrigibly stupid over his brain task not only discloses an unexpected manual dexterity when set at this work, but is induced by this very practice to use his mind more, and goes back to his books with sharpened wits.

As a constituent part of a liberal education in technology, the school-shop system, as described above, may be looked upon with doubt and circumspection chiefly as regards the extent to which it should be carried. The value of the training which a merchant may get who begins with sweeping out a country store, and rises step by step to the counting-room and the head of the business, is frequently exaggerated. In a limited business it no doubt renders one more alert and quicker at a bargain; but in the case of a business having great scope, its tendency is to magnify the importance of subordinate details, and to narrow the vision of the person thus trained. A young man generously educated will quickly master such details as are necessary for him to know, and will grasp the principles of his business more firmly, and have a more comprehensive outlook. There have been men who have risen by all the degrees to places of honor and trust, and there have been liberally educated men who have been visionaries in business, but the credit in the first case is not to be referred to the training, nor in the second case is the collegiate training to be charged with the defect. One thing may be confidently affirmed —that the best education for a servant is not the best education for a master. It will, then, be understood that the skill and

wisdom with which we arranged a course in mechanics for one who was always to be an artisan by the very limitations of his nature, and for one who was to make combinations, to superintend, to use his head more than his hands, would consist in giving the former a hand education, liberalized by a mental culture associated with it, and the latter a head education, fixed and illustrated in certain details and typical processes by a culture of his hands in the actual management of tools.

The educational problem which the Institute has assumed lies in this direction, and every one will wish it good luck in its experimental solution; but, after all, we can not help feeling that the chances for a high education in mechanical engineering are not likely to diminish; there are always active minds engaged in adjusting the best courses of instruction in that direction, and active minds seizing upon the means thus offered. The problem which appeals most strongly to our interest is that which lies at the basis of education in the mechanic arts. Again we come back to the question which has been asked more than once in this paper: Apprenticeship having disappeared, what can our enlightenment offer in its place? Was there any thing better than the old relation of master and apprentice, and can we show any substitute now worth considering, a substitute which shall give us skilled mechanics instead of ignorant, half-trained, and incompetent workmen?

The old relation of master and apprentice at its best was a good and sound one, but will any one assert that the apprentice learned his trade in the most economical and most thorough fashion? How could he, when his education was not the first, but a secondary, consideration? Take, for example, the condition of an apprentice in a printing-office. Is it to be considered that he will learn his trade as quickly as if he were actually going to school to learn it? If he were at school learning to set type, he would not, for example, be occupied hour after hour with picking over type, or doing the sundry petty offices which bring in him no return of education. He is able to move only so fast as the convenience of the office permits; and when the relation is not at its best, the apprentice was and is very ill placed for learning a trade. But the apprentice system has substantially disappeared, and it becomes necessary to discover a substitute which shall harmonize with the existing order of society and trade. Certainly nothing in the country has yet been offered so practical and reasonable as such a course of study as we find laid down in the school of mechanic arts. It presumes, indeed, a completion of the grammar-school course in the city, but the delay in entering upon one's trade thus caused is more than compensated by the thoroughness of preparation obtained.

The course introduced at the Massachusetts Institute of Technology may be taken, then, as a solution, so far as it goes, of the problem presented. Yet it is reasonable to suppose that the experiment there tried under favorable auspices will not be confined to a single Institute, nor to the class of schools to which the Institute belongs. If I am right in my measure of its place in technical education, it may be doubted whether the school shop is most appropriate in a school of technology like the Institute. We may heartily thank the Institute for leading the way, but if we are wise, we shall relieve it of a care which is in danger of withdrawing it somewhat from its higher work. The School of Mechanic Arts has the advantage at the Institute of an existing organization devoted so far to similar ends that material and teachers can be economically supplied. Yet the system is not dependent upon these helps, and we are able to call in illustration from another independent source, singularly useful in confirming the necessity and advantage of such a course of manual instruction.

There exists in Boston an Industrial School Association, which was organized in December, 1876, as the result of experiments which had for some time been carried on. Since its formation it has made some very interesting trials in the direction taken by the School of Mechanic Arts. It was resolved to undertake a course of instruction in the use of the common wood-working hand tools, which would teach primary arts of the carpenter, the joiner, the ship-builder, and the cabinet-maker. A competent committee has drawn up a series of primary lessons, and these lessons are undergoing the test of actual use in the school. The city has allowed the use of a ward-room, and there, on Tuesday and Friday evenings of each week, the school has been held. The room is provided with work-benches, allowing to each boy a space for his work four feet in length and two and a half in width. Each bench is furnished with a vise with common wooden jaws and an iron screw, a drawer with lock and key, in which the tools are kept, and a gas-burner with movable arm. The bench regulations for the conduct of the boys are as follows:

1. Be at your bench at seven o'clock, according to your number.
2. Do not leave your bench without permission.
3. Give all your attention to your own work. Do not notice any thing others are doing, unless requested to do so.
4. Make no unnecessary noise, such as whistling, etc.
5. Keep your bench neat, and do not deface it in any way.
6. After work place all your tools and other equipments in your drawer, according to your number, and return the key to teacher.
7. Every boy will be held accountable for the tools

placed at his bench for his use, according to his number.

The first eleven of the primary lessons cover the following points in the use of elementary tools:

1. Cross-cut saw.—Sawing to line.
2. Hammer.—Striking square blows.
3. Splitting saw.—Sawing to line.
4. Jack-plane.—Smoothing rough surfaces.
5. Hammer.—Driving nails vertically.
6. Splitting saw.—Sawing at exact angles to upper surface.
7. Jack-plane.—Setting the plane-iron.
8. Hammer.—Driving nails horizontally.
9. Bit and brace.—Boring in exact positions.
10. Mallet and chisel.—Mortising.
11. Jack-plane.—Producing surfaces which intersect at exact angles.

The system of analyses, as explained in the vise-work at the Institute, is followed here. The Russian system holds in both cases, and the entire class is instructed simultaneously in each lesson. If space permitted, it would be interesting to give in detail the first lesson, devoted to sawing to line. It is enough to say that it intends the analysis of every movement made in this apparently simple process—measuring, placing of trestles and board, lining with try square, holding saw, placing saw, drawing stroke, pushing stroke, finishing, with all auxiliary matters, such as watching the saw, pressure, and correction of deviation.

Here, then, is a similar experiment carried on by a philanthropic association, taking boys in their leisure evenings and giving them the mechanical instruction which they are, as a rule, so eager to acquire; while the attendance is voluntary, it is also necessarily limited, as the experiment is carried on in a single room. Before this school was started, however, and before the Russian system was introduced into the Institute of Technology, many of the movers in the enterprise had already carried on what was popularly known as the "Whittling School," where, by a similar series of lessons, instruction was given in wood-carving, and so successful was the experiment that it resulted in the establishment of a day school of carving and modelling, under the auspices of the Woman's Educational Association, where instruction is now given in modelling, casting, and carving for five hours a day for five days in a week during eight months in the year.

To what, now, does all this tend? The members of the Industrial School Association make no secret of their desire that in some form this element of manual instruction should be incorporated into the system of public-school education. Nor are the signs wanting that public sentiment looks in that direction. There has been of late years a growing disposition to criticise our public schools on the ground that they attempt too much, and offer a course of instruction out of all proportion to the practical use of the graduate; that knowledge and not training is made the end sought, and that in the desire to secure a high organization, individual powers and tastes are disregarded. Certainly the machinery of our public schools has grown more complex and costly, and it is to be feared that the children who leave them are confused oftentimes with knowledge rather than athleticized by training in elements of mental power. To a too intellectual training certain offsets have gradually been introduced. The introduction of drawing as a regular part of education has been a marked advance in the right direction, although the best methods of teaching it are still under discussion. The introduction of music in more systematic form came earlier, and was a very important sign of educational progress. Latterly sewing has been introduced with marked results for good, and the chief regret of its friends has been that there was not some universal implement like the needle in the use of which boys might be trained.

Now, in sewing, a twofold advantage is secured. The training of the hand and the eye follows, much as it does in drawing. Of the great number of boys and girls who leave our schools with a fair use of the pencil, how few ever add to their livelihood by drawing, yet the capacity to draw has been something more to them than the acquisition of a new power; it has been a training of the eye and the hand. Then the child who passes in our public schools through all the stages from threading a needle to cutting out a dress is supplied with an economy of power far more useful, in the lower sense, than the art of drawing is to her.

It is this twofold advantage which would be secured for boys could the sewing which their sisters are taught in the public schools be represented in their case by the more complex instruction in the use of tools. There is no simple tool for them like the needle—the jackknife hardly answers—and therefore the problem is a more difficult one; but the principle is the same, and the practical solution of the problem is to be found in the direction of the experiment which I have described in this paper. The School of Mechanic Arts at the Institute of Technology is now supplementary to public-school instruction; the school of carpentry carried on by the Industrial School Association is an evening school, to which public-school boys may go. It may be that the experiment must be continued by volunteer associations—the Massachusetts Charitable Mechanics' Association might well undertake the charge—but it is very likely that the claims of the school shops will be urged one of these days upon the attention of the public to a constituent place in the public-school system. It is noticeable, by-

the-way, how clearly it already fits into the department of drawing. Children resorting to the Whittling School, who had been trained in industrial drawing in the grammar schools, were quite competent to make their own patterns. As an illustration, one of the teachers said that he took some of the patterns from the drawing-book of his own child.

Whenever this question arises for final answer, it will be found closely connected on either side with two questions which people are beginning to ask. Manual instruction as an element in common-school education finds a singular alliance with the Kindergarten method, which is also passing through its experimental phase, and demanding recognition in the public schools. On the other hand, it is claimed that the State should not be burdened with the task of giving high-school education to the select few who can avail themselves of it. By a fiction we speak of our system of public schools ascending from the primary to the high school, and crowned by the college and university; we are misled by this specious grade into assuming that the instruction in the primary schools should be made preparatory to that in the grammar school, and that in the grammar school to the instruction in the high school. But in point of fact, while with few exceptions children in the primary schools do pass into the grammar schools, the grammar schools represent the end of education to the great majority of those attending them, and should be treated as finishing, not as preparatory, schools. When it is claimed, therefore, that children should have the rudiments of technical knowledge given them in school shops at the expense of the State, there will be many to ask, On what ground should the mechanic be given a training for his trade which will exclude the professional student from claiming a like privilege for himself? These questions will come together, and the best practical result will be in a public-school system so adjusted that the common school, including the primary, should stand as the meeting ground of all alike, and the high school on one side, the school of mechanic arts on the other, should be open to the diverging stream of life, whether wholly, partially, or not at all at the charge of the State, city, or town is a question in which both may stand or fall together; but the main question will be in the adjustment of the common-school course to the two special courses, the one looking to higher education, the other to artisanship.

YOUNG MRS. JARDINE.

CHAPTER I.

"I THINK, mother, I will go abroad, after all."

He who said this, suddenly and just a trifle sharply, had been sitting reading at the farthest end of a very handsome, not to say gorgeous, drawing-room, where a group of four ladies, whose clothes well matched the apartment, sat conversing: for I have no doubt they would have called it "conversation"—of a highly interesting and improving kind.

The young fellow in the distance, however, did not seem to find it so. He was at that age when men are very critical of women, especially of their mothers and sisters, unless these happen to be sufficiently beautiful ideals to remain such unto son and brother from the cradle to the grave: an exceptional happiness which befalls few; and it had not befallen Roderick Jardine.

The stout lady, who, the instant he spoke, pricked up her ears with a cheerful, "Eh, my dear?" was (eccentric Nature will sometimes have it so) very unlike this her youngest child and only son—as unlike as it was possible for mother and son to be. Light and dark, fat and lean, large-boned and slender, phlegmatic and nervous, they came of two diametrically opposite types physically and mentally. Morally—yes, there was similarity there; for Mrs. Jardine was a good woman, and Roderick was, as she ceaselessly declared, being very outspoken as to her feelings, the best of sons, though he was a little "peculiar," like his poor dear father, of whom he was the very image.

This was true. Her three daughters—now married and settled, except the last, who was just about to be—all took after herself. Not her present self, perhaps, but the comely lassie she must have been once—fair-haired, round-cheeked, with a wide mouth and slightly projecting teeth—though possessing sufficient good looks to be a belle in Richerden. Roderick alone "favored" the other side of the house: the tall, dark, rather sad-looking father, who came of old Highland blood, and not being in business like most of the Richerden folk, had led a rather retired life, keeping himself very much in the background even amidst his own family. Nobody really knew him, or thought much of him, until he died, which event happened just before his son went to college. Since then his widow had gradually blossomed out into great splendor; married her two daughters, taken her independent place in society, Richerden society, as a woman—I beg pardon, a lady—ought to do who has a large fortune, a fine

family, and a great capacity for managing both. People had said that she managed her husband; but those who knew Mr. Jardine questioned this. Gentle as he was, he was not exactly a man to be "managed" by any body.

"What were you saying, Rody, my lamb?"

Now if there was a pet name the young fellow disliked, it was his childish diminutive of "Rody." And no man of five-and-twenty is altogether pleased at being called "a lamb."

"Can you spare two minutes from that very delightful conversation of yours to listen to me, mother?"

"Ou ay, my dear."

The young man winced a little. "Wouldn't 'yes' do as well as 'ou ay?' But never mind, it doesn't matter, mother dear," added he, with a sigh, more of weariness than impatience. There are so many things in family life which people never ought to mind, and right-thinking people try to persuade themselves they do not mind. But of all the small sufferings of existence there are few more trying than a continual sense or dread of being "rubbed up the wrong way" by somebody whom you are bound to love—nay, do love, in a sort of tender apologetic fashion: that affection without sympathy which becomes at times an actual anguish, instead of a rest and a delight. To conscientious people this is always a sad position, especially when it unluckily happens to parents and children, who did not choose one another, and yet are bound to put up with one another to the last extremity of endurance.

"Honor thy father and thy mother" is a command nobody doubts. "*Love* thy father and thy mother" is a different thing, for love can not be commanded. Roderick did love his mother deeply and sincerely; but they were so exceedingly unlike by nature that only her extreme warm-heartedness and his strong sense of duty kept them from drifting asunder—and did not prevent his shutting himself up in a hopeless panoply of gentle reserve, as his father had done before him. For he and his father had been all in all to each other. The world had never looked the same to Roderick since Mr. Jardine died.

I should like to describe Roderick Jardine as he stood reflected in the huge mirror—the drawing-room seemed all mirrors and gilding, with a few pictures stuck in between, large "furniture pictures," as I once heard them described by an Edinburgh upholsterer, who was in the habit of providing such for the wealthy inhabitants of Richerden. Roderick was not a "furniture picture," but more like a Vandyck portrait—tall, dark-skinned, aquiline-featured: the true Celtic type as distinguished from the Lowland Scot. He had also slender, well-shaped hands and feet, another Celtic peculiarity, and dark eyes, which practical people might denounce as "dreamy." A long, soft, black beard, which had never known razor, completely hid his mouth: which fact had been a real comfort to him, as it is to many, born with a sensitive and nervous temperament, which it is the effort of their lives to overcome, or at any rate to conceal.

Such was this young man—not at all a young man of the period, since he neither smoked nor drank, betted nor talked slang. Yet that he was really a man the other "men" of his college had pretty well found out by this time. Quiet-mannered and refined-looking as he was, nobody attempted either to tyrannize over him or to take a liberty with him—not even his own mother.

"Rody, my boy," said she, coming to him half deprecatingly, "were you saying you wished to go abroad? It's late in the year, to be sure, but I'll not hinder you. Only you must promise me not to be climbing up Alps and tumbling into glaciers." *Glaziers*, she called them; and her voice had the high-pitched shrillness which Richerden ladies seldom quite get out of, even when they fancy they have merged their native accent in the purest of English. "Wherever you go, remember you must be back in time for Isabella's marriage."

"Certainly—and, mother, don't be afraid of my tumbling into a glacier, or of an avalanche tumbling down upon me. I shall only see the Alps at a distance. At this time of year one must content one's self with towns."

"That's hard, laddie, when you are so fond of the country. But do as you like—do as you like; only don't forget the marriage. You will have to give away the bride, Rody. —Ah! your poor father!"

The widow's eyes filled with tears. If she had not understood her husband, she had loved him—certainly, and more perhaps after his death than before it.

"Girls, for all your persuasions, I would never have put off my black gowns if it hadna been for Bella's marriage. I hope people will not think I am showing ony disrespect to poor dear Mr. Jardine," added she, relapsing, as she always did in emotion, to the broad speech of her youth, now toned down into an accent just a degree stronger than that of her daughters.

"Mamma, nobody could ever imagine you forget papa," said the eldest, with a glance at the only remembrance left of him—a mere photograph. He had always refused to be painted, though portraits of his wife and daughters, in startling costumes and varied attitudes, adorned the room. The likeness stood, scarcely more silent than he had been in life, regarding his affectionate and loquacious household: a grave, stately Highland gentleman—every inch a gentleman. How he came to marry into the Paterson fam-

ily was always a mystery, and remained so. Not for money, certainly: he had a small patrimony of his own, and was, besides, a man who cared little for wealth, having amidst his wife's luxurious style of living maintained the very simplest tastes—so simple that she with her love of show had been often aggravated thereby. Nor was it a marriage for position: his was much higher socially then hers. Could it have been for love? Certainly during the twenty-five years of their married life he had never given her or the world reason to suppose that he did not love her. At last he died, and the secret, if secret there were, died with him. It was best so.

"You may think thus, girls, but Rody would not, I am sure," replied the mother, in a complaining voice. "Rody always thinks different from us all."

"Mother," said Roderick, with that look in his eyes which was so like his father's—sad, tender, half-reproachful, and yet with a sweet appealingness, as if so long used to be misunderstood that he had learned to pardon it and pass it by—"mother, indeed I see no objection to your dress; and if you would like me to stay at home, I will. I have done with Cambridge, you know, unless I cared to go in for a fellowship, which I do not. Shall I put off going abroad till spring, and we will then go together, you and I, to Italy, Greece, Egypt, perhaps even ending with Jerusalem?"

"Oh, preserve us! such a journey would kill me. Fancy me on the back of a camel, crossing the desert, and not getting any thing to drink. Not even cold water, though I don't like water: even your poor father could never persuade me to it, you know. Nothing like a good glass of sherry, or even a wee drap toddy. I beg your pardon, my dear boy. I know it vexes you that your mother does not give in to your odd ideas. But never mind, Rody. Go where you will, and do what you like; only take care of yourself, and don't forget your old mother."

He was not likely, while there was that sweet expression, "the kind look that's in her e'e," as Burns puts it, implying the strong personal devotion which is to men in all relations of life most alluring, and, as in this case, makes amends for many contrary things. Things absolutely inevitable, as the son often said to himself; and tried to think of his mother's early education, or no education; nay, to remember as kindly as he could the old grandfather, once a working blacksmith, who had made such heaps of money in the iron line that his only child was able to marry a gentleman and become a lady.

But old Paterson remained exactly as he was. All his horses and carriages, his splendid house and magnificent dinners, could never make him any thing than honest Sandy Paterson, well-meaning and kindly, but utterly uneducated, boastful, imperious, coarse of speech and manner, with an extreme delight in good eating, and—must it be confessed? only nobody minded it much at Richerden—good drinking. Nevertheless the old fellow had his fine points, and his grandson knew them. Still, now that he was gone, Roderick never spoke more of him than was quite necessary. It was not unnatural. There is a vast difference in one's respect for the man who has made himself, and the man who has only made his money.

I am playing chorus to my story in a most digressive way, but it was necessary. Beginning a tale is like entering a family. Some households express themselves so potently that in the first half hour the visitor is acquainted with all their characters and ways; in others the under-currents run so strong that it takes weeks to discover them, and be able to form a fair estimate of persons and things. Had I described literally, without comment, the scene in Mrs. Jardine's drawing-room, it would have conveyed an utterly false impression—as false as that we sometimes carry from many a house, and which unconscientious writers are tempted to make amusing stories out of. It is so easy to laugh at follies, to mock at weaknesses, to condone agreeable sins; but to trace the root of these things, and to believe that our neighbors are, if occasionally worse, often a good deal better than we suppose them, is quite another matter.

This is why, instead of letting the Jardines speak for themselves, I have, at first, spoken for them; but there is no need to do it any more.

"Well, we'll talk the matter over another time," cried Roderick, who saw looming in the horizon that cloud of "conversation" under the shadow of which he had often shivered, when his clever mother and somewhat feebler sisters discussed a thing for hours together in every conceivable shape, and came to no conclusion after all. "At this moment I'm busy—I mean, I—I have an engagement. Good-by, every body. I'll be back at dinner-time."

"A little before dinner-time, please, my dear. Remember we have company—twenty at least—a regular dinner party."

"Oh yes, a 'meeting of creditors,' as my father used to call it," said the young fellow, somewhat bitterly. "No fear, mother; I'll be back in time, and do my duty to all the old fogies."

"They're not old fogies; there are some as nice girls as you could wish to see, if you'd only look at them, Roderick," said Bella, who, going to be married herself, quite lamented that her only brother seemed determined against matrimony.

"Well, I will, Bell, I promise you, only

let me go now." And snatching up his hat —a Glengarry bonnet, which he persisted in wearing, though his sisters told him it made him look like the Highland porters at the quay—he fairly ran away.

Out of the house he breathed, if one could be said to breathe in that dense and murky atmosphere which hangs over Richerden, with very exceptional intervals, from October till March. And he had become used to English skies, English views and ways, the stately surroundings and old-world quiet of English university life. Richerden, with its oppressive atmosphere, its dirty, noisy streets, where rich vulgarity and squalid poverty so closely alternated, was becoming to him not merely repellent, but obnoxious. He felt he should soon begin to hate it, long familiar as it was, with the fierce hatred of youth, which can not see the other side of things, nor believe that to every thing there is—there must be—two sides.

Rapidly the young fellow walked on through park and square, through street and wynd, or "vennel," as such dreary dens are often called here, shrinking from and detesting alike the poverty and the riches, the splendor and the rags. It began to rain heavily, but he heeded not. Though brought up in luxury, he was not luxurious by nature, could stand a good deal of hardship, and had a young man's instinctive pride in "roughing it." Still "an even-down pour," as his mother would have called it, is not an agreeable thing; and as in reality his only "engagement" was with himself, whose company he felt free to enjoy as much as any body else's, he stopped his walk and turned into a railway station, where at least he could sit down quietly and read his letters, which he had snatched up from the hall table on going out.

But having no very interesting correspondence—for he had left behind at Cambridge few intimates and no duns, also being, I fear, of a rather dilatory turn of mind, and given to the bad system of *laissez-aller* —Roderick left the letters unopened in his pocket, and sat idly watching the passengers gather for a train just about to start.

The town—or city, its inhabitants call it —of Richerden has one great merit: it is a capital place to get away from. Trains at all hours and in every direction will carry you from it into as glorious a region as you need wish to see on this side paradise—nay, I have sometimes thought paradise itself may be a little like it. Roderick had done the same in his childhood, always associating it with the land of Beulah, the "everlasting hills," and the river spoken of in Revelations, as "flowing from the throne of God." His young imagination, materializing and yet idealizing every thing, could not imagine aught more beautiful than this river and those hills, as they looked sometimes, and had looked ever since he could remember. When a mere baby, old enough to escape his nurse, but still small enough to be carried in the father's arms, he had often been taken by that tender father, in boat or train, for a day's holiday together. How they had enjoyed it! hiding themselves in heathery solitudes, by silent glens and merry burn-sides, dining off oat-cakes and milk bought at some cottage, or bread and cheese carried in the paternal pocket, the taste of which seemed more delicious than all the grand dinners eaten nowadays.

Afterward, when Roderick grew to be a big boy, it was just the same, only instead of playfellows they were companions, his father and he; for there was between them that which is the root of the only true and permanent relation between parent and child—entire respect on both sides. Mr. Jardine had the rare quality of not only loving but *respecting* childhood—its innocence, its keen sense of justice, its passionate and yet sensitive affections. In all their intercourse Roderick could call to mind no instance of his father's having been unkind, or, worse, unfair to him. Their life together had been one of entire confidence and pure delight from beginning to end.

Too soon had come the end—the cruel blank: and though in the strong interests of his college life he had somehow got over it, and felt no longer a boy but a man, still, "on revient toujours à ses premiers amours!" So sighed this poetical fellow of five-and-twenty; and thought when he was five-and-seventy the sight of the river and the hills would be dear and delicious still. And when he heard the guard calling out the name of a place where he and his father had spent many a happy day, on a sudden impulse he sprang into the train without a ticket ("just like Rody, silly fellow," they would have said at home), and was borne away.

Away, out of the smoke and fog and soaking rain; away, mile after mile along the shore of the gradually widening river, till the hills began to show their distant outlines, vivid and lovely as mountains always look after rain, especially in October. Nowhere is there such heavenly clearness, such spiritualized sunshine, such delicate and delicious coloring of earth and sky, as is often seen in these regions during the month of October. It felt to Roderick, who after the long vacation had patiently shut himself up with his mother and sisters at Richerden for weeks, like coming out of this world into the next—that heavenly country to which, consciously or unconsciously, we all look for the healing of many mortal woes.

He had none, though he often thought he had; but he was of that sensitive and poetic temperament which rather enjoys sadness—

in the distance. As he swept along in the train, and quitting it, started on an old familiar walk along high cliffs which gave him a view of the country, land and sea, for many lovely miles, Roderick's heart was very full. Not only of his father, but of himself and his own future, which lay before him like a map; the map of an untravelled country—untravelled but yet not undiscovered, for there were in it more certainties than lie in the lot of many young men of his age. He knew he would be well off, even rich, would never need to earn his bread unless he wished so to do, and would always be able to indulge any pleasant tastes, of which he had many, being, though not exactly a genius, of that appreciative nature which is next door to genius, and, combined with hard work, often does duty for it, not unsuccessfully.

Also, he could marry as early as he liked, the only difficulty being to find and choose the "fair and inexpressive She," who had not as yet expressed herself in any way. The queen of his soul was yet *in nubibus*. He had never in the least compromised himself with any of the young ladies he met. Indeed, he found them all too much of "young ladies" and too little of women, for his taste, and so was as perfectly fancy-free as any young man can be who has an ideal mistress clearly defined and painted in his head, to whom he is ready to bring all the devotion of his heart, if only he is lucky enough to find her.

Toward this unknown damsel he felt something like Endymion on Latmos top before the moonrise, and had already painted several ideal portraits of her in oil and water-color, and written a good many sonnets to her; but, fortunately for himself and the world, neither portraits nor sonnets had ever been exhibited or published. Nevertheless, alternating with the dear remembrance of his father, which hallowed every beautiful thing that they had shared together, was this dream of a lady—his future wife—whose sweet companionship was to perfect all life for him. What he was to do for her, I am afraid, never entered his mind. The whole thing was to be pure felicity—his felicity, of course. As to hers, *cela va sans dire* (Roderick liked French phrases, and was rather proud of his familiarity with the language, acquired through several walking tours in Normandy and Brittany).

Poor fellow! so young, so ignorant of life and its burdens. Yet he thought himself quite wise and quite old, and felt his burden very heavy indeed, and himself a most unfortunate fellow, on being obliged to go back to that "meeting of creditors" which he detested.

"But I'll enjoy myself here to the very last minute," thought he, and sat down on a heather bush—for on that high ground every thing looked as dry as if it never had rained and never would rain again, till the next time, which would probably be within twenty-four hours. Wrapping his plaid about him, he felt perfectly happy. That lovely outline of hills—he must just put it down; so, hunting in his pocket for the pencil that was always a-missing, he turned out the letters which he had crammed in there, and looked them over.

None attracted him, except a black-edged one; which, opened, he found was one of the "intimations" of death, customary in Scotland, acquainting him that there had died "at Blackhall, aged sixty-nine, Miss Silence Jardine."

Silence Jardine! Surely a relation. Who could she be? For he knew that his father and he were the last of their family.

However, thinking a minute, he remembered that in the business arrangements after his father's death, which, he being under age, had been managed entirely by his mother, she had told him that Blackhall, the ancestral property, "a queer tumble-down place which nobody would care for," was to be inhabited, as long as she liked, by Miss Jardine, a second cousin. This must be she who had now died.

"I wonder ought I to go to her funeral?" However, consulting the letter, which had travelled to Cambridge and back, he found this was impossible. She must have "slept with her fathers" for some days already. "Poor Cousin Silence! What a queer name, by-the-bye! I wonder what she was like, or if I ever saw her?"

And then, by a sudden flash of memory, he recalled a circumstance which in the confusion and anguish of the time had entirely slipped away: how, not many hours before his father died, there had crept into the sick-room a lady—an old lady, nearly as old as Mr. Jardine, and curiously like him. At sight of her a wonderful brightness had come into the dying face. "Cousin Silence?" "Yes, Henry," was all they said; but she knelt beside him, and they kissed one another, and he lay looking at her till the last gleam of consciousness faded away. After that—for he did not actually die for some hours—she sat beside Mrs. Jardine, watching him till the end. And after the end Roderick remembered she had taken his mother out of the room and comforted her, staying a little while longer, and then leaving; no one thinking or speaking much about her, either at the time or afterward.

Now, recollecting his father's look, and hers too, the whole story, or possible story, presented itself to the imaginative young man in colors vivid as life, and tender as death alone can make them. And when, carelessly opening another letter, he found it was from the lawyer of this same Miss

Jardine, stating that she had left him—"Roderick Henry Jardine, her second cousin once removed"—the whole of her small property, as also a diamond ring "which his father gave me many years ago," he was deeply touched.

"I wish I had known her. I wish I had had a chance of being good to her—poor Cousin Silence!" thought he.

And as he sat watching "the light of the dying day," which died so peacefully, so gloriously over the western hills, he, with his life just begun, pondered over the two lives now ended, the mystery of which he guessed at, but never could know, except that they were safely ended.

Doubtless he was rather a sentimental fellow, this Roderick Jardine; and there are many fellows of his age, entirely without sentiment, very good in their way. Still they are the sort of young fellows that some people—and, I own, this present writer—would not very much care for.

When the sun set, going down like a ball of fire which dyed the river all crimson, and the sudden gray chill of an October twilight came on, Roderick started up, a little ashamed of himself, and still more ashamed when he found he had entirely neglected to ask the time of the return train to Richerden.

"Just like me, mother will say," and, half laughing, but vexed—for it always vexed him to vex his mother—he tore along as fast as his long legs could carry him, to the railway station. The train was just going, and it was at the risk of his life—to say nothing of a penalty of forty shillings—that this foolish young fellow contrived to leap into it, breathless, exhausted, having nearly killed himself in his endeavor to "do his duty."

So he represented to himself, at least, and felt a most tremendous martyr all the way to Richerden. It did not occur to him that simply looking at his watch and the time-table would have saved all. But at his age we are so apt to overlook the little things on which, like the coral islands of the South Sea ocean, our lives are built. How far we build them ourselves, or Fate builds for us, God only knows.

Tearing up in a cab to his own door (or rather his mother's—he already began slightly to feel the difference), ringing as if he thought the house was on fire, and being met by the imperturbable butler with the information, "Yes, Sir, dinner is served. Mrs. Jardine waited half an hour, and then asked Mr. Thomson to take the foot of the table"—all this did not contribute to Roderick's placidity of spirit. When he at last walked into that blaze of gas-light, that dazzle of crystal and plate, that strong aroma of dainty dishes and excellent wines, and clatter of conversation, which make up a Richerden dinner party, he was not in the best frame of mind to enjoy the same.

During his father's lifetime these entertainments had been limited; but since, his mother had gradually fallen into the ways of her neighbors, and taken great pride in surpassing them all. She herself, sitting at the head of her very handsomely spread table, looked gorgeously hospitable, beaming all over with satisfaction, and talking in her somewhat loud but good-natured tones to every body around her.

Large, comely, richly if not quite elegantly dressed, her broad fair face always a-smile, and her "lint-white locks" with not a gray thread in them—you could not help liking this warm-hearted, good-natured woman, though you might not have wished her for a mother, or even a mother-in-law.

She was so busy talking, and the silver-gilt épergne was such an effectual barrier between the upper and lower ends of the table, that she never noticed how her son-in-law elect quitted his place and her son slipped into it, till the deed was done. Then Roderick might have received a good hearty scolding, not undeserved, had not something in him—was it his father's look?—repressed the ebullition. She merely said, "Oh, my son is there, I see. Better late than never." And the dinner went on.

Roderick, conscience-stung, which he was rather apt to be, set himself to talk as politely as possible to his mother's guests—the "creditors" to whom she owed a dinner, and felt bound to give an equally grand one in return—nay, a grander if possible.

Hers certainly was a magnificent "spread," and she watched its progress with undisguised satisfaction. Course after course succeeded each other. There was set before the company about six times as much as they could possibly eat, and ten times as much as they ought to drink, though they did their very best to do both. What else could they do, when every thing to tempt appetite and destroy health was lavished upon them with a cruel kindness worthy of Heliogabalus?

Young Jardine, who was by no means an ascetic, and had the wholesome enjoyment of youth in all things reasonably to be enjoyed, yet felt, though he had been used to them all his life, that there was something in these feasts which jarred upon him extremely—more and more the older he grew. They were not given from hospitality—it was merely paying a debt owed; nor from friendliness—there was scarcely a person at table of whom he had not heard his mother and sisters speak slightingly, mockingly, even contemptuously at times; nor for social and intellectual companionship, since the talk was of the most vapid description, mere gossip, chitchat, or badinage.

Roderick, who was unfortunately a young man with an ideal, a sense of right, of fitness, of beauty, born in him, and also put into him through constant association with that dear

father who had died with his ideal unfulfilled—poor Roderick sat at the end of this uncongenial board, feeling not so much like a death's-head at the banquet as a living man among death's-heads. For what a death in life it must be—an existence whose sole aim was good eating and drinking, splendid horses, and elegant clothes! Not that these things are bad—in moderation—and with something higher beyond. But, with nothing beyond?

The young fellow—full of hope and aspiration, with a keen, intelligent enjoyment of life, schemes for making the very best out of it, and yet not wasting it: liking to be happy, and yet liking to make his fellow-creatures happy too, so that he might leave the world better than he found it—felt, at the end of that luxurious dinner, as if he had been feeding for the last two hours on Dead Sea apples.

When, the ladies having retired, he still had to keep his place and "pass the bottle" —which he loathed—to elderly gentlemen, ay, and young ones too, who evidently did *not* loathe it—listening meanwhile to talk in which, whether it was his own fault or not, he could not get up the smallest interest, this young Cantab, who for three years had lived in what was a little better atmosphere than that of Richerden—socially as well as physically—was a good deal to be pitied.

So was his mother too, when, having succeeded in luring the guests up stairs, he—her only son—went and hid himself in the back drawing-room and "sulked," as he overheard her say, lamenting over him as a black sheep, in the loudest of whispers, to a lady he particularly disliked.

But it was not sulking, for he had his father's sweet temper. It was only the utter weariness of spirit which, in uncongenial circumstances, comes over the young as well as the old—oftener the young than the old: since these latter see beyond it: the former never do. To them their first despair is a despair eternal.

"How in the world shall I bear—this—sort of thing!" Roderick could give it no more definite name. Outwardly, his family life was quite satisfactory—nay, most enviable. He had all this world's good things at his feet—a mother devoted to him, and whom he loved very sincerely: his sisters too, though he saw little of them, they were so engrossed in their own affairs, were good and kind. Why was it that home was not home? that he felt infinitely more solitary, more dull, in this gay house than in his two poky college rooms? that in his pleasant and affectionate family he was regarded—and knew it—something like Andersen's "Ugly Duck," whom every other duckling swims away from, and even the mother mourns over and scolds at?

While smiling over the comparison he blushed; for he was not a conceited fellow, and had no idea of ever turning out to be a swan.

"But I wish they would leave me alone in some quiet corner of the duck pond," thought he. "And still more I wish I could find a creature or two like myself to swim or fly with—wild ducks I suppose they must be. Oh, if I had any excuse for flying right away!"

And then, with the habit he had of passing over things at the time and recurring to them afterward, there came into his mind a sentence in the letter from Miss Jardine's lawyer, explaining that in making her will she had said to him that her only other kindred were some distant cousins, living she believed in Switzerland, whom, if they were poor, she "left to Roderick's kindness."

"Capital idea! I'll go straight to Switzerland and find them. It would at least be something to do."

And the mere notion of this brightened up the young fellow's spirit and warmed his heart—he was, I fear, but a foolish young Quixote, after all: so that when his mother called him to do civility to the departing guests, he came forward with an air of cheerfulness such as he had not worn all the evening. Ay, even when he had to escort the most honored guest to the very carriage door, from an unsteadiness of gait politely ascribed to gout, but which Roderick, with a contempt so sad to see in the young to the old, even when the old deserve it, soon perceived to be—something else.

"Mother," cried he, indignantly, as he returned to the drawing-room, where the two ladies stood on the hearth-rug of their "banquet hall deserted," hot, weary, a little cross, and not a little glad that "it was over"—"mother, I wonder you let that old fellow enter your door. He has not an ounce of brains, and less of manners. Didn't you see he was drunk?"

"What an ugly, vulgar word! And to say it of Sir James, who holds such a good position here, and is Mr. Thomson's father too! Rody, I'm ashamed of you!"

"And Bella is more than ashamed, angry. Oh, Bell," and with a sudden sense of brotherly tenderness, half regret, half compunction, he laid his hand on her shoulder, "have you thoroughly considered this marriage? Are you quite sure of the young man himself? These things run in families. Suppose he should ever turn out a drunkard—like his father!"

"Stuff and nonsense!" said Bella, sharply. "And even if Sir James does enjoy his glass—why, so do many other gentlemen. It isn't like a common man, you know, who never knows when to stop. Now Sir James does. He is not 'drunk,' as you call it, only 'merry.'"

"Roderick," said his mother—and when she gave him his full name he knew she was seriously displeased—"the Thomsons are one of the first families in Richerden, and live in the best style. Isabella is making the most satisfactory marriage of all her sisters, and I desire you will not say one word against it."

"Very well, mother." And with a hopeless sigh Roderick changed the conversation.

He had the one weak point of gentle natures—he could not endure strife—would do almost any thing for peace' sake. Often he let a thing pass—a matter of taste, sometimes almost of principle—rather than hold his own and fight it out. Only when driven to extremity could he really turn at bay, like a wild stag of the forest, and show his sharp horns.

"Mother, have you thought over what I said this morning about going to Switzerland?" asked he, impelled by the sad longing of much-worried people—to run away. "Because since then I have found an added reason for my journey." And he gave her the two letters which had come on from Cambridge. "I suppose you had not heard of Miss Jardine's death, or you would have put off the dinner party?"

"Why so? She was only a poor relation. Nobody knew any thing about her here. Her death was not even put in the newspapers."

"Then you did know of it? But, of course, one could not mourn for a person whose death was not important enough to be put in the newspaper."

Mrs. Jardine looked puzzled, as she often did when her gentle-speaking "lad" spoke in that way; she could not make out whether he was in jest or in earnest.

"My dear, I don't see why we should notice the death of Cousin Silence. It would be very inconvenient just at the wedding. She was a very good woman, no doubt; but she was only your father's second cousin, though he was always most kind to her, and let her occupy his house at Blackhall for years. Besides, she was a great invalid, though she never made much fuss about it, and hardly ever stirred from her own fireside. When I got the 'intimation' I couldn't help thinking she was well away."

"Yes, well away," said the young man; and with a young man's chivalric tenderness he henceforth buried in his deepest heart this dear dead woman, whom he had seen his dying father kiss. But he did not name her again to his mother or to any body.

It was quite late that night before he succeeded in explaining to Mrs. Jardine, or in making her at all comprehend the necessity of it, his wish to start off at once to Switzerland in search of these distant relatives, who might be poor, and therefore would have much more right to Miss Jardine's little property than he had.

"I don't see that at all, Rody. She left it to you, and I'm sure it was very kind of her, though you will never want money."

"And they may."

"But why can't you inquire about them—send out a confidential clerk, for instance?"

"That would be a much more business-like proceeding, I allow, mother, and you are the best woman of business imaginable; I know that. But still, 'If you want a thing done, go yourself. If you don't care about it, send.' Was not that my grandfather's maxim, mother? And it generally succeeded."

"Ah, you're a coaxing laddie," said Mrs. Jardine, one of whose fine qualities was affectionate pride in her low-born father. "Well, go, if you like. But it's just a wild-goose chase; that's what I call it."

"So do I, mother. Only I'm not the hunter; I'm the wild goose, and I want to take a good long flight and stretch my wings. Then I'll come back as tame as possible, and settle down in the dullest and smoothest of ponds."

"Oh, I wish you would settle down," said the mother, earnestly. "There's plenty of girls in Richerden—nice girls too, the Miss Bannermans and Miss Fergusons, and little Maggie Marjoribanks that's *so* fond of you!"

"Don't tell me that, mother; you ought not;" and the young fellow blushed all over his face. "It isn't fair to the girl, or to me. She's a very charming girl, of course, and she has got heaps of money"—again the sarcastic ring in his voice—too sarcastic for so young a man; "but you know I don't care a pin for Maggie Marjoribanks, or any of Bella's fine friends. They're all too much young ladies for me."

"You don't mean to say you want a young person?" answered Bella, satirically. "A dress-maker, perhaps, or a governess, or somebody that earns her own living. Mamma, take care!"

"I don't want any body. I want to be free. I have plenty to do, and to enjoy also, before I 'settle down,' as you call it. Can't you leave me alone to manage my own affairs?"

"Ah, do let the poor boy alone!" cried Mrs. Jardine, yawning. "Don't let us sit up talking any longer. Rody, my dear, go where you like, do as you like; please yourself, and you'll please me."

"I have no doubt he'll please himself, mamma," added Bella, who dearly liked to have the last word. "And I can imagine the sort of wife he is sure to bring home some day."

"Can you?" said Roderick, biting his lips. "At any rate, she will not resemble Maggie Marjoribanks, or you." And then his conscience smote him for his sharp words—he

had such a tender conscience always! "Oh, do let me go away, mother!" with almost piteous entreaty. "Perhaps I may come back a better fellow, so that you have not always to find fault with me, as seems the case now. But I don't mean any harm. Really, the de'il is not as black as he's painted—by his sisters especially."

"Black, my son?" said Mrs. Jardine, fondly, as he bade her good-night and kissed her—he was not too proud to kiss his mother every night and morning still. "You're just the very best son that ever mother had, and so I tell every body."

"I wish you didn't, mother dear; but I suppose you can't help it." And so half laughing, yet slightly sore at heart, Roderick sprang up stairs—three steps at a time—to his own bedroom, where at least he could shut out every body and every thing, and "his thoughts call home" to the fancies and crotchets that pleased him best.

It was a small room, almost in the roof; but he had chosen it, much to his family's surprise and remonstrance, as soon as they came to this grand new house, because from it on very clear days you could see right across the park and suburbs of Richerden to the "blue hills far away," which are the unacknowledged blessing of that wealthy but unsanitary town. Now, in the still moonlight of midnight, with the early snow on their tops, they were plainly visible, if you only took the trouble to undraw the curtains and lower the gas.

Roderick, being a sentimental youth at best, did so, and it comforted him. The vexation of his spirit melted away bit by bit. These were, after all, such mere trifles to be vexed about, when all life, with its grand aims and large ambitions, lay before him—nay, in his very grasp. Talk as they might, his womankind could do nothing. Even his mother had no real power over him. He was of age, and free to come and go as he chose. As to money—well, it must be confessed, money was the last thing this young fellow ever thought about or inquired into. He had a sufficient allowance, paid regularly, and spent honestly, though certainly spent, up to the very last half-penny, and that was all he knew or cared about it. Blackhall, he understood, was now his own—rather a weight on his mind—and then there was Miss Jardine's touching bequest, just heard of.

In the quiet moonlight, looking at the dim white outline of the "everlasting hills," his mind went back to its musings of a few hours back—over those two finished lives, the real history of which neither he nor any one would ever know. It was all peace now.

He determined to go, the very next day, to visit Blackhall, which he had never yet seen, and knew little about, for his father rarely named it, though it had been the home of the Jardines for many generations. Also, they must have had a burial-place, for he had some recollection of his father's having once expressed a wish to lie there, only his mother had overruled it in favor of the grand new cemetery on the outskirts of Richerden, where she had afterward erected a beautiful white marble sarcophagus with an urn at the top. What matter? Henry Jardine slept well. And far away, somewhere beyond those moonlight mountains—near the very places where they might have played together as children or walked together as young people—slept also Cousin Silence.

But the waking? If it be possible that the life to come shall heal some of the wounds of this life—oh, the heavenly waking!

MENDELSSOHN'S LETTERS TO MADAME MOSCHELES.

EVER since the publication of Mendelssohn's letters he has been known to his readers as a charming writer, describing his wanderings with a ready pen. In his visit to Goethe at Weimar, although young in years, we find him ripe in his conception of the great master. He is an ardent admirer of the beauties of nature, as well as of the works of the old masters and the creations of his contemporaries, whether in his own or the sister art. Filial affection lends a particular charm to his descriptions; his advice to his brothers and sisters commands our respect, while his wit and humor are ever entertaining. Then, if music is the subject on which he writes, he shows himself one of the most profound musicians of his time.

Thus we know him under many different aspects, but never have we come upon a series of letters written to a lady friend, a simple musical amateur, such as we are now offering to the public.

It is the man, the affectionate friend of the house of Moscheles, including the children, which we must look for in these pages; the intimate description sometimes of his work, at others of his social life, which does not always escape satire; and the ever-recurring expressions of gratitude toward his friends the Moscheleses, so vividly depicted that it has been thought necessary to suppress them every now and then.

The letters being intimate, names have for the most part been indicated by ——, and some explanatory remarks annexed to each letter as a clew for the reader.

London, *June*, 1873.

"*January* 6, 1829.

"DEAR MADAM,—I hardly know how to ask your pardon for my sins, for I have a load of them on my conscience; yet were I to trouble you with a string of excuses, you might think that a new sin. Truth to say, my writing thus late is unpardonable, considering all the kindness and friendliness you showed me in the spring, but it is true also that these last few days have been the only quiet ones since we parted. First, there was our Highland tour[1] in any thing but favorable weather, with bad roads, worse conveyances, still worse inns and landlords, and the richest and most picturesque scenery—all of which so entirely engrossed us that we could not collect our thoughts for even a single day. Then I returned to London, and just as I was finishing some work, and getting through all manner of business before starting for the Netherlands to meet my father, I had the mishap to be upset in a gig, and was obliged to be six weeks in bed and two months in my room. At last I was able to travel home, but my injured foot being very weak, the journey proved both painful and dangerous, and I felt so prostrate when I did reach home that I was condemned to another imprisonment of several weeks. A few days ago we celebrated the silver wedding of my parents, for which I was obliged to finish some work;[2] so you see I had a most busy and varied time of it, the happiest and the most disagreeable days of my life following each other in quick succession. Of course I feel rather upset by all this. Witness this careless, confused letter, yet I would not put off writing lest I should add to my sins.

"And now I do not know how to thank you and Mr. Moscheles, for words can not sufficiently express my gratitude. You know what it is to visit a foreign land for the first time,[3] and to be a stranger among strangers. This feeling, perhaps the most terrible of all others, I have been spared through your kindness, and it is you who have lessened the painful weight of my first separation from my family. If England has made a favorable impression upon me, it is to you I chiefly owe it; and now that I have got over the most difficult part of my tour, I augur favorably for the remainder of it. I am not going to thank you for each individual act of kindness, or for all the trouble you took about me: if I did, there would be no end of it; but I may say to you and Mr. Moscheles that I appreciate from my heart your friendly feelings toward me, and the kindness with which you received me, making all things easy that were difficult to a foreigner. As long as I remember my first entrance into the wide world, so long shall I also remember your goodness. I do not know when I may be so fortunate as to *say* all this to you instead of writing it down in these formal cold characters, but I do hope for the pleasure of another meeting before long, and for a continuance of those friendly feelings, for which I shall ever remain, yours gratefully,

"FELIX MENDELSSOHN-BARTHOLDY."

[1] The *Highland tour* was made with his friend Klingemann, of the Hanoverian embassy, whose lovely verses were often composed, always admired, by Mendelssohn, and who proved his friend through life. When the accident befell Mendelssohn the Moscheleses were in Germany.

[2] The *work* alluded to was the operetta *Son and Stranger*, in which every member of the family wished to take part. The painter Hensel, who had married Mendelssohn's eldest sister, being totally unmusical, had the part of *one and the same note* composed for him.

[3] Mendelssohn's visit to London in 1829 was his first, and his *Midsummer Night's Dream* overture, then performed, the beginning of a series of triumphs. His father had previously written to Moscheles asking his advice as to whether Felix, setting out on his travels, should go to London first, or later on. Moscheles strongly advised the former, and in conjunction with their mutual friend Klingemann made all the necessary arrangements for him. The tone of this first letter, written some time after Mendelssohn's return, shows there subsisted then less intimacy between him and the Moscheleses than in later years.

During this first and all the subsequent visits to England, Mendelssohn was a frequent guest at the Moscheleses' house, and many notes relating to their respective plans and engagements passed between them, only one of which is here translated, as showing in a few simple words his attachment to his old master, Professor Zelter, whose death he had just heard of, and his affection for the friends to whom he turned in his bereavement:

"DEAR MRS. MOSCHELES,—If you are quite alone at dinner, and also in the evening, I should much like to come to you. I have just heard of the death of my old master. Please send a line in answer to

"Yours, F. M. B."

"BERLIN, *July* 25, 1832.

"DEAR MRS. MOSCHELES,—If this were only a note, and the servant waiting below to carry it to you in an instant, instead of a letter travelling by post, steam, and sea in such a serious, business-like manner, whilst I have nothing serious to say! I merely long for a chat with you, indulging in a little innocent abuse of the world in general, and a special attack upon phrenology;[1] a weak-fingered pupil down below in Moscheles's study playing all the while a slow presto, and being suddenly startled by a few brilliant notes from another hand[2] to relieve her dullness: in short, to go to Chester Place;[3] for if I wish to talk to you, it is you I want to hear, and not myself. Now all these wishes are vain; but why have you strictly forbidden me to thank you ever so little? for that is what I really want to say, but dare not, feeling that you would

laugh at me. And, after all, there is no way of showing gratitude for happy days. When you look back upon them they are already past and gone, and while they last you think all the pleasure they bring most natural; for I did think it natural that you and Moscheles showed me all the love and kindness I could possibly wish for. I never thought it might be otherwise; whilst now I do sometimes feel that it was a piece of good fortune, not a matter of course. All this seems stupid; but if you only knew how strange I have felt these last few weeks, and how unsettled is all I say and think! When I left you on Friday night to go on board the steamer,[4] I pictured to myself how very much changed I should find our house and the whole family—two years' absence, married sisters, and so on; but I arrive, and after the first two days there we are as comfortably and cozily settled as though there had been neither journey, absence, nor change of any kind. I can not conceive having ever been away, and did I not think of the dear friends I have made meanwhile,[5] I might fancy the whole intervening time a lively tale I had been told. That, however, is not the way I can get on. Every step I take brings some fresh recollection of my journey, which I dreamily pursue for some time, being far away; then I meet my parents and sisters, and with every word they say and every step we take in the garden[6] another recollection from *before* the journey starts up and stands as vividly before me as though I had never been away, so that the most different events become intermingled, and unsettle my peace of mind. Whether all that will subside again I can not tell, but for the moment I feel as one thrown hither and thither, not able to find any support. The past and present are interwoven, and yet I must learn that the past is past. Never mind; the best part of all this remains, and that is why I write this letter and send it off, little as it may be worth. You have sometimes forgiven my 'unbearableness,' and even pretended it was owing to my genius. Now there you were mistaken. But 'the heart is black,' says the beadle (Klingemann must tell you that story if you don't know it).[7] Only fancy, I have not been able to compose a note since my arrival! That is the cause of my troubles, I think, for could I settle down again to work, all would be right. Haven't you got some German or English words for a song which I might compose? Of course for a voice down to C and up to F,[8] and I could play the accompaniment in 1833 on the Erard,[9] while from below was again heard the 'slow presto.' But I think I could not even write a song just now. Who can sing praises to the spring when shivering with cold in July—when the green leaves drop, flowers die, and fruit perishes in summer? For such is our case. We have fires; the rain pours down in torrents; ague, cholera, and the last decision of the German Diet (Bundestagsbeschluss) are the topics of the day; and I, who played my part in Guildhall,[10] am compelled to be guarded and conciliatory lest I should be considered too radical. To-day the cholera is announced again, although not by desire; this Russian gift will, I suppose, settle down amongst us, and not leave us again in a hurry.[11] I am glad there are no quarantine laws, as formerly, or else the communication between Hamburg and Berlin might be cut off, and that would be inconvenient to me for certain reasons. Although when I first mentioned to your sister in Hamburg that you or Moscheles might possibly come here, I suddenly fell into disgrace. She looked at me very angrily, and asked what was to be got in Berlin, and who took any interest in music *there*. I named myself, but found little favor in her eyes: I was detestable, growing more and more so, the very type of a 'Berliner,' she thought; next I became a stranger, then yet more, a strange musician, and lastly she turned severely polite. But I changed the subject, remembering your good advice to try and win her favor; so I said that, after all, it was not likely you would go to Berlin, and that quite reconciled her. Secretly, however, I say come—do come! We shall do every thing to make Berlin as agreeable to you as it *can* be made; and if Moscheles were to tell me that you intended coming on the 1st of October, I should begin this very day to think with joy of that date. There is comfortable room for two in the 'Schnellpost-coupé,' and the journey is a most easy one. You should make up your mind to come. I will not tease you any more to-day, but will only beg you will let me know when you go to Hamburg, that I may write you a letter in sixteen parts, with every part singing out, 'Do come!' It is true, you will be charmingly situated in Hamburg, and I know how difficult it must be to leave it. Your father's new house is a most delightful one; the exterior close to the 'Alsterbassin,' and with a view of the steeples of your Hanse town; the interior light and cheerful, well furnished, and not crowded, and every comfort to be found by those even who have just left London; besides which, the owner, all the rooms and furniture, and, above all, the large music-room, plainly show how anxiously you are expected. No doubt, then, you will find every thing charming and comfortable; but although we have no fine view and no comforts to offer, we should one and all rejoice to see you, and that, indeed, is the main point. By-the-bye, Madame B—— is here, and has met with little success. She intended giving a concert, and the bills announced that Mr. O——, her husband, was

going to assist her; but the Berlin people would not be attracted, so she gave it up, and performed at the theatre between two comedies. People said there was no soul in her playing, so I preferred not hearing her, for what a Berliner calls playing without soul must be desperately cold. Take it all in all, I am *blasé* with regard to Hummel's septet and Hirtz's variations, and the public was quite right to be *blasé* too. Then, again, Madame B—— is not pretty, so I prefer Madame ——. But how ill I have behaved to her! Do apologize for me; but, above all, take my part with your sister if she calls me disagreeable and abuses me for what I said about Berlin.[12] Tell her it was from sheer selfishness I spoke, and that I chiefly thought of my own pleasure in wishing to see you both and the children again—that I am selfish altogether; for so I am, and do want you to come. My love to Emily and Serena, and may you and Moscheles be as well and as happy as I wish you to be! Yours,

"FELIX MENDELSSOHN-BY."

[1] Phrenology was then considered with great interest, but always laughed at by Mendelssohn, who would not believe in it.

[2] The room in which Moscheles sometimes received pupils was directly under the drawing-room, and Mendelssohn, when on a visit to Mrs. Moscheles, used often to feel amused at their vain attempts to produce quick movements such as *he* understood them, and such as Moscheles would teach them by throwing in some bars at the right time.

[3] Chester Place, No. 3, in the Regent's Park, was the Moscheleses' residence.

[4] The steamer took him from London to Hamburg, whence he proceeded to Berlin.

[5] His London friends were numerous and distinguished. I would only name the Grotes, the Alexanders, the Taylors, the Kembles, and I might add many others, to whom the man was as dear as the musician, and who at that time received him as a friend.

[6] The Mendelssohns' house and garden, situated in Leipzigerstrasse, No. 3, in Berlin, at the present time forms part of the building in which the Reichstag is held.

[7] A certain beadle in a country church being reprimanded by the clergyman for wearing a scarlet instead of a black waistcoat, called out: "Never mind, your worship, if only the heart is black."

[8] The voice alluded to was that of Mrs. Moscheles, to whom he sometimes gave a singing lesson.

[9] The Erard was a splendid instrument, presented by the then head of the firm, Pierre Erard. His uncle had invented a new mechanism and taken out a patent for it, which allowed the key when struck to repeat the note, although but half-way down. Mr. P. E. wanted Moscheles to play on these new instruments, but he found them stiff and uncongenial, and for a long time preferred the Clementis. At last, when many changes had been made upon his suggestions, the day arrived when he declared them perfect, and consented to play upon one of them in public. After the concert Erard offered him a precious ring (an emerald between two diamonds) in remembrance of the event.

[10] Mendelssohn used to delight in attending meetings at Guildhall to hear Liberal speakers.

[11] He had a slight attack of cholera in Paris, but soon recovered.

[12] Mrs. Moscheles's friends living in Hamburg, they greatly objected to their spending their short holidays any where but with them; hence the joke about Mendelssohn's quarrel with the sister.

"BERLIN, *September* 3, 1832.

"DEAR MRS. MOSCHELES,—Truly I am a sinner to have kept such a dogged silence after all the pleasant and friendly things you wrote; but I need scarcely say how truly grateful I feel for your letter, and that its arrival seemed to bring a holiday. All else concerning myself is as uncomfortable as a 'drifting fog.'[1] There are times when I should prefer being a carpenter or a turner, when all things look at me angrily, and when gladness and happiness are so far removed as to seem words of a foreign tongue wanting to be translated for me. Such times, in their dullest shape, have haunted me for the last few weeks. I feel unspeakably heavy. And why, you will ask, write all this to me? Because Neukomm[2] last night treated me to a most beautiful lecture that did me no good, and proposed all manner of excellent remedies, which I am not inclined to apply, preached to my conscience, which I can do just as well myself, and lastly asked why I had not yet answered your letter. Because I am in an ill temper, I said. But he would have it that every body ought to write exactly as he feels, and that he knew you would not be offended at it, but consider it quite natural; so it is upon his responsibility I do write; and should you be angry, I am a better prophet than he, for I wanted to wait for a more favorable moment to send you a merry letter, while he pretended you did not care for *that*.

"As for your journey to Berlin, I have written Moscheles a regular business letter, telling him how matters stand, according to *my* notion and that of others. I will not repeat my request and wish on that score; it might appear selfish and encroaching, and being thoroughly averse to either, I would avoid even their semblance. If you, however, say your sister has half pardoned me because you are not likely to come here, that is but poor comfort, and I would much rather it were the reverse. You would pacify your sister on your return, and I would give you *carte blanche* to tell her the most awful things about me, to paint me as black as any negro, for then you would have been here, and what harm could all the rest do me?

"If —— flirts, I can only consider it just and praiseworthy, for what else are we born for? But should he marry, it would make me die with laughing, for what figure is —— to cut as *paterfamilias*? Yet you predict it, and I know you can always read people's thoughts in their faces—did I wish for bread at dinner, you at once whispered, 'Some bread to Mr. Mendelssohn;' and perhaps you might make a guess at the bride also. On the other hand, I too am a prophet in matrimonial matters, and uphold exactly the reverse. —— is a Knight of the Order of Bachelors, and so am I. Who

knows but we may both wish to marry thirty years hence? But then no young lady will care to have us. Pray cut this prophecy out of the letter before you burn it, and keep it; in thirty years we shall know whether it proves true or not.

"You want to know how the dresses[3] pleased? But do you not know it was you who chose them? And must I assure you that they play a prominent part on all festive occasions, and are much admired and envied? Moreover, a professor of chemistry expressed his astonishment at the beautiful brown of my mother's shawl, saying it was dyed so much finer than he thought it *could* be. Now whether every thing is cut out right, and according to the newest fashion, I can not tell, and that is one reason why you should come, just to enlighten me. But oh! how I should like you to lecture me as you used to do.[4] For indeed I do not know how to bear up against my low spirits.

"Excuse this stupid letter—it is the type of my mind—and give my love to all around you. Ever yours,

"Felix Mendelssohn-Barth."

[1] He was subject to moods of depression like the one here described.

[2] Neukomm, the composer, was a mutual, much-valued friend, advanced in age.

[3] Mendelssohn was most anxious to bring beautiful presents to his mother and sister, and got Mrs. Moscheles to go and choose them with him.

[4] She was allowed the privilege of "lecturing" him, and used to be called his grandmother, although but four years his senior.

"Berlin, *January* 17, 1833.

"Dear Mrs. Moscheles,—It is unpardonable to reply thus late to so kind a letter as yours, and moreover on an unceremonious half sheet of paper,[1] and that is the very reason why I rely upon your forgiveness, for, says the proverb, 'small thieves are hung, great ones allowed to escape.'

"How I enjoyed all the nice details of your letter! I felt comfortably at home in sight of your fireside, Moscheles's siesta, and that whole snug household of yours. I rejoice like a child at the thoughts of approaching spring, my dignity as a godfather,[2] green England, and a thousand things besides. My melancholy is beginning to vanish, I have again taken a lively interest in music and musicians, and have here and there composed some trifles; they are bad, it is true, but they give promise of better things—in fact, I breathe more freely, and things look brighter. Whether I shall be able, after all, to bring some creditable novelty with me to London, Heaven only knows; but I hope so, for I would cut a figure not only as a godfather, but also as a musician; the former, however, comes first and foremost. I will make the most serious face possible, and bring the very best wishes and all the happiness I can gather together to lay down as a gift at the christening.

"And so Moscheles is busy again? Klingemann[3] mentions a septet, and I caught it up joyfully. What instruments is it for? In what key? Is it fair or dark? He must let me know all about it; and will other honest people be able to play it, or will it be again for his own private use, like the last movement of the concerto in E flat, which all amateurs stumble at and sigh over without being able to master it? Do let me hear all about this septet, for I am longing to know, and almost envy those who can watch its gradual progress.

"I am most truly grateful to the Philharmonic directors for wanting me to write for them at the very time I felt so low-spirited and cross; it made it all the more valuable. But you do not say whether Moscheles too is to compose for them. Will he accept, and what will he write? I shall bring the whole of my symphony, one more work besides, but hardly a third one.

"Do not for a moment think I am put out about the Cologne affair.[4] I have enjoyed a good many of the same kind in Berlin that were at first rather bitter to the taste. As I am giving my third concert to-morrow, I know what it is to be a great Berlin man. After it had been settled, not without difficulty, that the whole of my receipts should be made over to them, my first concert was well filled, and Berlin enthusiasm prevailed, which means that the words 'divinely and heavenly' were used as much as 'pretty well' is in ordinary language. My symphony in D minor and the *Midsummer Night's Dream* were performed, and I played my concerto and a P. F. sonata of Beethoven. And now you should have heard how very polite the same people turned who had been so stiff before; how my noble heart, my philanthropic views, my only reward.....It was fit for a newspaper, but it came just a month too late; at one time it would have pleased me, now it was a nuisance, and indeed so is the whole place, with its parade and sham.

"At the second concert we had 'Meeresstille.' I played a concerto by S. Bach, a sonata of Beethoven, and my capriccio in B minor. Madame Melder sang some scenas by Gluck, and the concert began with a symphony by Berger.[5] This I had performed to gratify him, but he found its success so short of his expectations, and the execution so bad, that it was only by dint of great exertion I escaped a complete quarrel with him. At the third concert there will be my overture to the *Isles of Fingal*, the *Walpurgisnacht*, a concerto of Beethoven, and a sonata by Weber for P. F. and clarionet, with Bärmann, of Munich, and then an end of the honor and pleasure. Excuse all these lengthy details, but indeed there is not much

else to report in the way of music. Bärmann[6] has lately given a concert and enchanted us all. (I mean all of us who live in the Leipzigerstrasse, and all Berlin besides.) Lafont is shortly expected; M—— too—it makes me cold to think of him. Mademoiselle S—— has appeared, and with moderate success. Her father is chapel-master, her brother a singer, her uncle in office, her aunt the wife of the father of the waiting-woman of some princess. That kind of thing is necessary in Berlin. Count —— has lately taken me under his wing, saying that something might be made of me, so he would patronize me and get me a libretto by Scribe. Heaven grant it may be a good one, but I don't believe it. Besides, we are on the road to improvement, going to have telegraphs like you. By-the-bye, the two Elslers, whom they here call the Telegräfinnen,[7] are going to London. Should they bring letters to you, and should you have to receive them also, I shall die of laughing, but present I must be. What will your John say, who thought Schröder-Devrient not a lady? And how is Mademoiselle Blahetka? and is Madame Belleville again in London? Spontini means to sell his instrument for no less than 1600 thalers. If you see Erard, and wish to return him *one* compliment for ever so many, do tell him that my instrument is excellent, and that I am delighted with it, for that is the truth.

"And now, dear Moscheles, I answer your outside postscript in the same way. Many thanks for it. Write soon again, and let me hear at full length from you. The 'Sing Academie' has not yet chosen a director, and there is as much small-talk about it as ever.[8] The V——s are here for the winter; I see but little of them, as I scarcely go out. Thank you for your list of the Philharmonic concerts, but I shall be glad if I can come to the last four; quite out of the question to hear them all. But when must I be godfather? or rather a witness to the holy rite? That is the question.

"And now I send very best love to all Chester Place, wishing every body joy and happiness and music and all that's good in this new year, in which we mean to meet again. Until then and ever your

"Felix Mendelssohn-By."

[1] It was the custom at that time to show respect for the person addressed by taking a large-sized sheet of paper.

[2] Mendelssohn had promised to be godfather should a son be born to the Moscheleses.

[3] The septet was written for the Philharmonic Society, Moscheles being requested, as well as Mendelssohn, to write something for these concerts.

[4] The Cologne affair was some unpleasantness about a conductorship, magnified by the papers.

[5] Berger was his piano-forte teacher when a boy.

[6] Bärmann, the most celebrated clarionet-player of his day.

[7] Gräfinnen, the German for countesses. One of the Elslers being particularly tall, he would have it that her long arms resembled those of the old-fashioned telegraph.

[8] The Sing Academie, it was thought by Mendelssohn's friends, ought to have chosen *him* as director, but such was not the case.

"Berlin, *February* 27, 1833.

"Dear Mrs. Moscheles,—Although I can send you but a few lines to-day, I want to offer you my congratulations, and tell you that I enter heart and soul into your joy at the happy event [the birth of a son]. How pleased I am to think I shall soon see the little stranger, and that he will bear my name! Do wait till I come, that I may in reality be able to accept your former invitation to the christening. I shall certainly hurry as much as I can, and arrive as soon as possible. I rejoice in its being a boy. He must become a musician; and may all such things as we wish to do and can not attain be reserved for him! Or if not, little does it matter, for he will become a good man, and that is of most consequence. It is true, I see at this distance how the two grown-up Misses Emily and Serena will tyrannize over him when he is fourteen years old; then will he have to suffer many a side glance, his arms being voted too long, his coat too short, and his voice very bad. But when he becomes a man he will patronize the two, doing them many a kindness, and bearing the tediousness of parties to chaperon them.

"I am sure you have been a little offended (or maybe a good deal) at my laziness in writing, but do pardon me now. I promise to improve, particularly so when in London, where I can be my own letter-carrier, and improvise my questions and answers; but improve I shall at any rate.

"Kindest messages.....

"I must now begin the last movement of my symphony (the Italian); it is burning at my finger-ends, and spoiling them for letter-writing. Excuse, then, these hasty lines. You know how they are meant.

"Yours,

"Felix Mendelssohn-Bartholdy."

"Berlin, *March* 17, 1833.

"Dear Mrs. Moscheles,—I wish you were not at home when this letter arrives, and that he who is to be named Felix plays with a rattle or screams lustily in English, which means that I hope you and the new member of the family are as well as I could wish and hope for. Klingemann gave such a good report in his last letter that I could only rejoice, and must now again congratulate you with all my heart.

"Let me try ever so, I can't help thinking that such an important event, such a change in the whole family and its most intimate relations, such an increase of happiness as well as of cares, must work a thorough alteration in people, and I shall soon find out whether I am right. But if you do not let

me hear to the contrary, maybe with a scolding for not writing, or rather for my last bad letter, or with a slight satire on my genius, or any thing of that kind, I shall feel shy in Chester Place on my first London evening, and timid if asked to play to you. Do you happen to be engaged on the 21st of April? If not, I should like to come to you with Klingemann, who is going to fetch me, and I fully intend being in London on the 20th. A 'Schnellpost' is just driving past, and reminds me that I shall soon sit inside one. Strange to say, since I have begun to work hard, and have attained the conviction that Berlin society is an awful monster, I should like remaining here some time longer. I feel comfortable, and find it rather difficult to set out travelling again. All the morning there is constant knocking at my door, but I do not open, and am happy to think what tediousness I may have escaped, unknown to myself. But in the evening, when I go across to my parents, we can enjoy many a merry laugh and hot debate. I feel a pleasure, indeed, that it is not easy to run away from, as not knowing when it may be met with again. But why write? We shall talk it all over. I shall have an answer much sooner, or rather it is I who should give it, since I own that you have heaped fiery coals on my head. To-day it is to Moscheles I am writing to ask him a favor. I want him to send me some of the information he has to give all the year round. (It might be photographed à la ——.) The brothers ——, violin and violoncello, wish to go from Paris to London for the season, if they had a certainty, or at least a chance, of paying their travelling and other expenses; that is what they want to question you about, dear Moscheles, and I volunteered to write to you, as my father did for me about three years ago. Now, however, I have clean forgotten the matter for the last few weeks, and would beg of you to send me a few lines for them by return of post; but pray let it be by the very next return, as they are dreadfully offended, and have left off bowing to me. They are quite right, moreover, as the time is drawing near, *en cas que*—

"A most gentlemanly Russian called upon me some few days ago, and told me a good deal about Madame B——. I wish you could have heard him, dear Mrs. Moscheles. The Russians seem to be more thorough-bred than our Hamburg towns-people. She can not succeed with them, much as she tries; *she* would, but *they* won't, and all my gentleman had to say about her pretensions and affectation seemed incredible. Any body passing for affected in Moscow or Petersburg must be so indeed; *that* even the Berlin people allow.

"The other day I heard a Berlin pianist play the worst variations on 'God save' that I have ever listened to, and that is speaking volumes. The man had great technical ability and good fingers; and yet his performance was hollow and lifeless, and his banging about made me feel miserable. Where in all the world has our Berlin good taste hidden itself? Then, again, I have lately heard the *Zauberflöte*, the best performance, I believe, that is to be met with nowadays. It is evident that each individual is doing his utmost, that they one and all love the music, and that the only thing wanting is an *ensemble*, which I fear will not be met with in Berlin whilst the sand remains sand and the Spree river. This conviction brought on my low spirits last autumn, but by this time I take the matter more easily, and think that spring will bring us a return of warmth and verdure; that is the best opera we can see and hear. *Au revoir* then in the spring.

"Ever yours,

"Felix Mendelssohn-Barth."

"Düsseldorf, *April* 25, 1833.

"Dear Mrs. Moscheles,—Should this sheet of paper turn red by the time Klingemann arrives, it would but show the reflection of my face, covered with blushes, for I feel so ashamed! But when a man has once taken to hard-heartedness, he becomes insensible to kindness and friendliness, and remains hardened, and goes on sinning without compunction. That is *my* case. And this does not even pretend to be the answer to your most kind letter, but my own accusation, bearing witness to my having truly received that letter of yours, and nevertheless having remained deaf and dumb, after which you would be warranted in refusing to read all this. The truth is that since I have got used to this place I feel comfortable; my mind is at ease, and I do a good deal of work both at home and abroad, consequently am very happy. This I ought to have described to you at full length, but could not (maybe Klingemann can do so verbally), and so kept silent; but toward Christmas I mean to send you some musical novelties and a letter as well, and then Moscheles must give me his opinion of the music, according to his promise. He will by that time have conducted my overture in F, and will report about it, so that I shall have a letter spite of my sins. Now that is being hardened indeed. Better change the subject.

"Here comes the book of songs, formally made over to you; and should Klingemann not give it up, he is worse than a 'gazzoladro.' I do intend sending you a proper book of MS. songs at Christmas; but you won't believe me, so I'll set about writing it first.

"And how goes on Moscheles's sonata for two performers?

"After all, this is but a note, and I ought

to conclude by saying, 'I am truly sorry I can not dine with you this day week, because I have a previous engagement at Mrs. A——'s.'

"Would this were the only impediment to our meeting!

"All love to Emily and Serena, and every good wish for your welfare. Should little Felix show his content by saying *Ba!* or otherwise prove his friendly disposition, you must tell him all about his godfather, and give him his love. *Fare*well and *remain* well. Ever yours,

"Felix Mendelssohn-Bartholdy."

"Düsseldorf, *May* 31, 1833.

"Dear Mrs. Moscheles,—Repentance *only*.

"But I have been more beleaguered than ever; have dropped down on my bed at night unable to write, think, and scarcely speak. That sounds touching, but is true, nevertheless, so do not be *too* angry with me. This is the first leisure day, and I write:

"That I shall, please God, be back in town on Wednesday the 5th, ready to christen, play, conduct, and even to be 'a genius.'

"All else verbally.

"So farewell till we meet.

"Felix Mendelssohn-By."

"*September* 13, 1833.

"Dear Mrs. Moscheles,—Here is Berlin, September 13, and my father[1] once more safely lodged in the Leipzigerstrasse, and feeling quite well. I should write you a long and detailed letter did I not wish you to hear at once from this place, which we reached yesterday, and which I must leave again the day after to-morrow, so you may fancy how the whole day passes in my family, and that I have neither time nor inclination for letter-writing. But to recollect the whole of the sad time which lies behind me, and all the kindness I received in it, to feel relieved from a great responsibility, and to think of those who assisted me to bear it, *that* I have ample time and inclination to do, and that is what these lines are meant to convey to you. All my Berlin belongings are well and happy, and send best love. My father had the mishap to drive a nail through the shoe into his foot. It was on the Rhine, at my uncle Professor Mendelssohn's place, and on the very day the steamer brought us the Dirichlets.[2] He was laid up again for several days, and had to perform the whole journey to Berlin stretched out in the coupé. This little accident caused him a greater depression than his serious illness in London, so that he felt excessively impatient to see his own home again, and almost despaired of it. This made the whole journey, and in particular our necessarily slow progress, with so many inns and nights' lodgings, most irksome, and my own impatience became the greater for having to be kept profoundly secret. But then I felt happy indeed as we were driving through the well-known court-yard entrance and I knew that journey was safely over. The foot had been but slightly injured, and to-day my father is allowed to walk about.

"I should have written to you from Cologne or Düsseldorf, but not knowing where you had gone to, begged of Klingemann to let you have the few lines I addressed to him, and now hope you will let him know of our arrival. I am not sure whether he is in Paris or London, and can not possibly make up my mind to write unless I feel sure of the place my letter is to go to. You, I fancy—perhaps erroneously—to be again in the Regent's Park.

"Excuse haste. I shall write properly from Düsseldorf,[3] where I must be in a few days. And now farewell to you both. My love to Felix, Emily, and Serena. Wish I could send her two carnations.[4] Pray give them to her in my name, and be you happy.

"Yours, Felix Mendelssohn-By."

[1] Mendelssohn's father had accompanied him to England. On their viewing the Portsmouth dockyards he knocked his shin violently; it became an open wound, which Sir Benjamin Brodie at one time despaired of healing, but a change for the better occurred at last. The devotion of Felix in nursing his father is not to be described: it was touching.

[2] The Dirichlets were his younger sister and her husband, a professor of mathematics.

[3] Mendelssohn was at that time Kapellmeister at Düsseldorf.

[4] Carnations and lilies-of-the-valley were often interchanged between him and the M.'s second daughter, as being favorite flowers of both.

"Düsseldorf, *February* 7, 1834.

"Dear Mrs. Moscheles,—I do not venture to begin this letter until I have written to Moscheles for the last two hours. I am sure I have never deserved such a scolding, for give it me you won't, that I know. Yet all my other discrepancies, such as talking German at table with English friends, not being able to carve at the H——'s, having defective coat buttons, not paying H——l the proper compliments, are mere nothings to what I deserve. But does it, perhaps, give you satisfaction to hear that I have a very bad conscience? or that I have some kind of feeling like a naughty child about to confess? or that Klingemann has left off writing to me? To speak seriously, there are many minutes in the course of each day when I think of your dear home, wishing I were there, and when I enjoy the recollections of the time I have spent in it. That much you must believe, and now, whether such thoughts bring forth a letter or not, that depends more or less upon chance. Alas! I am not coming to England this year. I mean to make the best use of my time

trying to produce something before I begin to travel again. You can hardly imagine how much better and brighter I feel for the last few months' work, and how much easier I get on with it; so I must keep it up, that I may get into proper trim. My birthday reminded me of that at the right moment. I have told Moscheles a good deal about the life I now lead. We gave *Egmont* with the Beethoven music a little while ago, and I had the joy to hear something of his for the first time, which has not happened to me lately.

"By-the-bye, you are rather against Goethe in some things, so I recommend you to read a newly published correspondence between him and Zelter, in which you will find plenty of matter to confirm your opinion, and yet I should oppose you bravely, and defend my old favorite as formerly. Do you know the chorus on Lord Byron which occurs in the second part of *Faust*? It begins, 'Nicht allein.' Should you not know it, pray read it quickly, for I think it will give you pleasure. This is English tea-time coming on, and my fear vanishing more and more. To-day there is a *grand déjeuner dansant*, of all the Berlin ways I hate, the the most hateful. The lazy set! They meet at half past eleven A.M., and pass their time with dancing and eating until one o'clock in the morning. There are few things which I think so ugly, no matter whether the sunlight is allowed to shine upon them, which is one way of arranging them, or whether the shutters are closed about mid-day and the chandeliers lighted, as they do at court. Then, again, they have danced almost every night for these last two weeks, and that until five in the morning, —— being at the head, giving and accepting no end of balls. I have been saved all these splendors by a bad cold, which has confined me to my room for the last week, and which is now nearly gone, but which will serve me as an excuse for keeping shut up until the end of the Carnival. You see we live in grand style here, and were I to enumerate all our dinner parties, you would feel still more Berlinese and countrytownified than on the last page.

"I wanted to send you some new songs, but must again postpone it, as I have a great deal to do to get ready for this parcel. I should like to know, too, how goes on the singing, whether you practice sometimes according to the wise rules of your wise professor.[1] You want to know whether I have got quite out of sorts here, whether I stand in awe of any one, as I did of you, with regard to elegance, or rather neatness? Madame H——, whom you must have seen at Berlin, does sometimes give me a set-down, and perceives on my first entering the room what I should not have found out in six months; but she is not quite as much up to it as you are, so that I fear you will find me most uncivilized should I venture again to quit my virgin forest, and as to my taste for settling a cravat, that will be completely spoiled here. I promise, however, to learn again.

"Love to E. and S., and to my little godson. The little creature can not yet understand it, but never mind. Adieu then, and be well and happy. Ever your

"FELIX MENDELSSOHN-BY."

[1] Meaning himself.

"DÜSSELDORF, *May* 15, 1834.

"DEAR MRS. MOSCHELES,—On the very day I received your dear kind letter and the beautiful present, I was going to answer at full length, and with best thanks, but there arrived at the same time the news of my mother's dangerous illness; and although a better bulletin followed, I could not bear writing for fear of inflicting my low spirits upon you, if but for a moment, since *your* letters always make me feel happy for the rest of the day; so I preferred to put off answering. To-day there is excellent news, thank God! My mother has been walking in the garden, and is quite herself, and, of course, so am I; and in this happy mood, when a great load has been taken off my mind, when I can breathe more freely, I sit down at once to write and thank you.

"Not being able to get across this year, I do beg and pray of you to let me have a few lines now and then, for while I read them I am in Chester Place, and live through it all with you—rejoice in —— keeping away from the party, make fun of Miss M——'s note in which she 'couches her refusal,' threaten —— with my displeasure at the Beethoven sonata, admire Miss U——'s beauty without ever having seen her, and so on, just as I follow your descriptions.

"And how grateful I am to you, dear Moscheles, for doing my rondo the honor of playing it at your concert! You may believe that I fully appreciate it, and feel greatly flattered; and now if any body abuses it ever so much, I shall still love the piece, and hold it in high consideration. Please write me word if you like the orchestral accompaniments, or if you find fault with any part of them. I may, perhaps, write something of the kind in the course of this year, when I would wish to avoid former faults.

"The cravat, however, dear Mrs. Moscheles, I put on at once, and, so adorned, went out for a ride. You must know I have bought a nice bay, and that it gives me immense pleasure. When I went to the H——'s in the evening, Madame H—— asked if that cravat were English too. I gave her your message, and she returned it very sincerely. But you have not told me what composition I am to write in the time saved by this cra-

vat which does not require tying.[1] It is to you I owe this spare time, and you ought to say how I am to employ it. Shall I write P. F. pieces, songs, or what else?

"And did the people at the Philharmonic not like my *Mélusine*?[2] Never mind; that will not kill me. I felt sorry when you wrote it me, and quickly played the whole overture through, to see if I too should dislike it; but it pleased me, and so there is no great harm done. Or do you think you would in consequence receive me less amicably at my next visit? That would be a pity, and I should much regret it; but I hope it will not be the case. And perhaps it may please somewhere else, or, if not, I write another one which pleases better. On the whole, what I like best is to see such a piece on paper, and if, besides, I am so fortunate as to hear such kind words about it as those I had from you and Moscheles, it *has* been well received, and I may go on quietly doing more work. I can not conceive your telling me that Moscheles's new concerto was not well received. I thought it clear as sunshine that *that* must please the public, the more so when he plays it himself. But when is it to be published, that I may pounce upon it? Pray do excuse this confused style of letter-writing. Ries, the violin-player, is here (you may remember his accompanying Moscheles's trio at Berlin); he is going to give a concert to-morrow, and so I have been constantly interrupted by all sorts of people employed in the arrangements, and have to rehearse every day, in consequence of which my poor bay has not left its stable for the last three days (this, you see, is the principal subject on which my mind turns).

"At Whitsuntide I must go to Aix-la-Chapelle to the music festival, and am not the least inclined to do so, since they perform pieces which my musical conscience revolts at; but go I must, for a quiet life, as the people of this place will consider Ries[3] and myself as pope and antipope, and Ries happening to conduct, they fancy me jaundiced with vexation, and think I shall not go. I, however, drink 'Maitrank'—a good beverage, with white wine, aromatic herbs, and sugar—and do go. This reminds me of S——.....

"And what kind of a figure does De V—— cut at a dinner in Chester Place? Stop. By-the-bye, have you heard of a Mrs. ——, who has gone with her father from here to London to play the piano? She must, at any rate, pass in review *once* before Moscheles, and I should like above all things to hear of her doings in London. The father *would* set me up here as his daughter's rival, and has tried to abuse and vex me in every way, and finding that I took no notice, is going to try what he can do in London.

"Lovely weather we have had for some time, and there is every temptation to be perfectly idle, saunter about all day, and try for the title of an inspector of nightingales, which they have conferred upon an old lounger of this place. Warm days, and so delightfully long, and I have already begun my oratorio, which is the reason I can not go to the Westminster festival, but must keep to my work. I have made a few capriccios, or fantasias, or.....for the piano that I like vastly well, but an abominable *étude*. I have made a pun on Ghys, but a bad one, and I see you knitting your brows should you hear it. This morning, for the first time after a long interval, a little song has come into my head[4] that is always a treat. Oh! I must write it down for you, although I am sorry to say it is not at all for your voice, but for a tenor. You need not even play it; yet I write it into this letter. Moscheles will hum the voice part to himself.

"*May* 18.

"This letter was begun three days ago, and I have not yet been able to finish it. Ries, the violin-player, has left again. We played Beethoven's grand sonata in A flat, dedicated to Kreuzer, at his concert, and that by heart, which was great fun. I do not know whether I told Moscheles that the scores of my three overtures, 'Midsummer Night's Dream,' 'Meeresstille,' and 'Isles of Fingal,' will appear in a few days at Breitkopf and Härtel, which makes me unspeakably proud. As soon as they are to be had they shall be presented, and I only wish I could have again dedicated them to you, dear Moscheles. That being impossible,[5] my friends at home wished me to inscribe them to the Crown Prince, who has shown himself extremely gracious to me this last autumn. For my own part, I wanted the Philharmonic, and so I don't know yet. It is a weighty question.

"And do you know, dear Mrs. Moscheles, that Varnhagen is going to be married again —six months after his inconsolable book about his wife[6]—and that to my cousin —— .....A young musician has just left who brought me an atrocious fugue to look through; also another native genius that feels an impulse to write chorales, till I turn yellow with impatience; and yet he writes chorales ever since I have been here, the last always worse than the preceding one. As we go on being vexed with each other, there are some lovely scenes, he not being able to understand that I still find them bad, and I that he has not improved them. I am, however, the very type of a 'Cantor,' and preach so much to the point that it is good fun to hear me. Here are lilies-of-the-valley—how pleased I should be to send Serena some! but even without them she is to thrive, and Emily and Felix as well. And how goes on Emily's tune? Now there

is an end to my paper; indeed, I have talked nonsense enough. Farewell.

"Ever yours,

"FELIX MENDELSSOHN-BARTHOLDY."

[1] Mendelssohn used often to complain that he was a bad hand at tying his cravat, and that it took him an immense time to do it; so Mrs. Moscheles sent him a "stock."

[2] The *Mélusine* was a failure at its first performance, and so was Moscheles's "Concerto pathétique."

[3] Ferdinand Ries, who had lived many years in London, and then retired to Godesberg, near Bonn, conducted some of the Rhenish music festivals, and so did Mendelssohn, which was the reason of the papers setting them up as rivals.

[4] The "little song" which he sent in the letter was the "Mailied: Leucht' heller als die Sonne."

[5] He speaks of the dedication to Moscheles as impossible, having just dedicated several pieces to him.

[6] Varnhagen's first wife was the celebrated Rahel.

"DÜSSELDORF, *January* 10, 1835.

"DEAR MRS. MOSCHELES,—I ought to be kneeling on peas[1] all the time I am writing this letter, sinner that I am! And indeed in my heart I *am* kneeling on peas and doing penance for my long silence. Such a shocking return for your kind letter after the Birmingham festival! Only the courier who is to take my long-promised sketch to you leaves to-morrow, or I should scarcely have written to-day. This, however, ought not to increase my sins and iniquities; it must rather lessen them, for, you know, there are times when I feel but a poor mortal, and avoid speaking or even thinking about myself. Such times will come upon me every now and then; and not having a confidential friend in this place, they attack me more severely than any where else. And now fancy my getting a letter like your last at such a moment! I am taken right into the midst of your busy, interesting life, and, of course, doubly feel the monotony of my own, which puts a stop to all letter-writing; for were I to speak of myself and my work, I should only increase my low spirits. In short, I feel a predilection for the spleen as well as for any other English commodity, and it (the spleen) returns me the compliment. Why, then, should I bore you? Better leave letter-writing alone. Thus stood matters; to-day there is a change for the better. I am to present my picture to you, and that in due form, with a deferential bow, which I beg you will see with your mind's eye.

"My sketch,[2] taken at Venice in October, 1830, represents the Bridge of Sighs. Should it be out of drawing, you will not set that down to me, but fancy the Doge's Palace just tumbling down, consequently leaning on one side. The water is the 'partie honteuse.' I have labored the whole morning to make it a little clearer, but it only became the muddier; so there again imagine the tide happens to be out, because then the water throughout Venice gets thick and muddy, and might look as ugly as mine does. My sky, again, is rather murky; but a certain Nicolaï of Berlin has just published a stupid book meant to prove there is nothing worth looking for in Italy—the country devoid of beauty, the pictures too dark, the people dull and heavy, no white beer,[3] no oranges, and the sky overcast like our own. Should he speak the truth, it would make the color of my sky right. Anyhow, should you not disdain my sketch, do let me make you another. I am improving, and my next will be better—maybe a Swiss landscape, with meadows and houses, for that I delight in doing. How I wish I could take this to you myself, and have the chance of listening to your improvements!

"I shall be glad if I can get to you in the spring; though, much as I want to, I fear it will hardly be possible. I shall have done my work by then just as I planned it, but the question is, ought I to begin something fresh, instead of taking a holiday? One thing, however, I do know, that if I treat myself to a visit to England this year, I will lead a very different life in London to what I did before—try to keep as quiet and retired as I do here, and not go into society unless really obliged; but as to you, I shall pester you with visits till all your patience is exhausted. Until then I must work hard at my piano, for I fear I have lost a good deal. The other day, however, when telling a friend how Moscheles and I used to improvise together, and showing him some of the passages, I could have given any thing to start for London at once to enjoy the same pleasure over again, for in this place I never get to hear either myself or any one else. On the other hand, there are what I call good days, and most enjoyable ones, when the work prospers, when I have a long morning to myself in my own quiet room; then life is charming indeed.

"And pray how do you all get on? Is there already some 'miss' playing her scales down stairs in Moscheles's study? or is he allowed a little leisure to compose and make music? Does little Felix cry very much? Has Emily grown? for of that, you know, I am sadly afraid. I was going to send you another song to-day, but could not get on with it, which annoys me, so you must even rest satisfied with this dull, unmusical letter. And now farewell, and may you all be happy and merry in this new year! May it bring you every blessing, and me a happy meeting with you and Moscheles! All my belongings keep sending messages, which I never give you, although my father is always mentioning your kindness to him and his regard for you. Ever yours,

"FELIX MENDELSSOHN-BY."

[1] Kneeling on peas was a way of punishing naughty children, now gone by.

[2] The sketch is in water-colors, and now in Mrs. Moscheles's possession.

[3] Berlin white beer is famous, and a favorite beverage.

"Leipzig, *October* 11, 1835.

"I can not forego the pleasure of sending you, dear Mrs. Moscheles, an account of the last two days, although necessarily a short one, being beset by professional and unprofessional visitors. It was really too delightful, and only a pity you were not here to enjoy the treat Moscheles gave us all. Those two days were indeed thoroughly musical ones, with every body in a state of excitement, and full of genuine enthusiasm.

"Let me begin with the concert the day before yesterday: you know the programme, and you also know how Moscheles plays. Well, then, directly after his 'concerto fantastique' the shouts of applause began, and the noise lasted throughout the evening, continued at yesterday's rehearsal, and promises to make this evening's concert one of the most joyous, the Leipzig people being half crazed. Besides, you know, the room was the most crowded we have had for years; but the intense interest and delight which pervaded the audience pleased me most.

"When we got to the end of our duet[1]—and it did go well, I assure you—the most deafening acclamations broke forth, so that we played the last eight or ten bars without any body, not even we ourselves, being able to hear whether we did it correctly; nor did they leave off clapping and cheering till they had us out again to perform a duet of—graceful bows. And now you may fancy how madly they went on after Moscheles's 'extempore playing.' It is true, he produced some things bordering on witchcraft, which to this day I have not been able to understand, although he pretends they were mere nothings; and as to the audience, it was so excited, so appreciative, and in such glee as to give a bright tinge to the whole production—*that* was the most delightful part of it. An English lady, rather blue, wanted to be introduced, and vented her enthusiasm, whilst a score of Leipzig ladies of all colors waited for her to make room. (And here is the proper place to inform you that Moscheles twice admired a Leipzig lady, and told me so in whispers; whereupon I threatened to let you know, which I am now doing.) Well, then the Leipzig ladies came to the balustrade of the orchestra, and Moscheles bowed down to them; then came the dignitaries of this place, then one or other of the art critics, who gave detailed reasons for their praise, and lastly the committee of our concerts (consisting of twelve gentlemen—not one lady), to beg they might hear Moscheles's overture to *Joan of Arc* once more at this evening's concert. A work of that kind has too many novel and striking points to be at once understood by the band and audience, so that its repetition is just the right thing. They have now played it four days running, and it will go to perfection; even at yesterday's rehearsal it was quite a new piece, and much more beautiful. The duet too has to be repeated *by desire*, and as Moscheles had already promised to play his concerto in G minor, we shall, I think, have a splendid night of it. You remember he has styled the first movement 'Malinconico,' which I in my illustrative sketch[2] for your album have turned into blue-devils.

"Let me just add that at yesterday's rehearsal Moscheles played his concerto in a more masterly manner than I believe I have ever heard him, which is saying a great deal, and that the unanimous applause must have given him some pleasure. It was the last piece of the rehearsal; the overture had been played beautifully, and now we all—the unoccupied—formed a large circle round him. Madame Graban, our prima donna, turned over, the other singers standing close by; a 'Kammerherr' who had come from a distant place in the country, and fancied himself a good pianist, kept his eyes fixed on Moscheles's fingers; the band exerted itself to the utmost; and so he played the piece charmingly, and to every body's delight. I only wish you and he could have seen the smiles and nods of the band and audience, their secret looks of astonishment, and the panic of the 'Kammerherr.' Accustomed as Moscheles must be to such demonstrations, yet I fancy that in this instance they pleased him afresh. As to myself, I can not sufficiently tell you how I enjoyed his visit. Alas! it is coming to an end, as he is returning to you the day after to-morrow; but it was a happy time, long to be remembered, and ever with delight.

"I am again interrupted, and expect Moscheles in an hour to take me to his mother,[3] where I am to play; so I am obliged to conclude, leaving him to tell you verbally all the Leipzig news, which I should have preferred writing here, did not the Hambro' mail leave at ten o'clock.....

"Ever yours,

"Felix Mendelssohn-Barth."

[1] Moscheles was on a visit to Mendelssohn, then conductor of the "Gewandhaus concerts," gave a concert of his own, and played at the "Gewandhaus," where his new overture to *Joan of Arc* had to be repeated. The "duet" was his "Hommage à Handel."

[2] The "illustrative sketch" is a kind of musical catalogue of Moscheles's works, Mendelssohn's pen-and-ink drawings, as well as the names appended to them, delightfully comic. They form the border of the sheet, whilst in the centre there are four lines of poetry by Klingemann set to four parts by Mendelssohn, and sung on Moscheles's birthday by the then German opera company—Schröder-Devrient, Haizinger, Hauser; the second soprano by Madame Haizinger, who was a celebrated German actress.

[3] Moscheles's mother had come from Prague to meet him at Leipsic.

Postscript of a letter to Moscheles for his wife, and an unpublished song[1] sent to her:

"*December* 12, 1837.

"DEAR MRS. MOSCHELES,—Though I don't know whether you still care for me or my songs, yet I have put this one in, from old habit, whether you sing it or not, but I wish you would. Oh, if we had not missed each other this time in England![2] I could not get it into my head, and every day that I spent in London made me more conscious of my loss. My wife thanks you herself for your kind words. It was horrid to leave her behind me in Germany. It would have been my greatest joy to show her England properly; at any rate, I have made up my mind not to leave her again at Düsseldorf when I have to go to Rotterdam. It was too abominable.

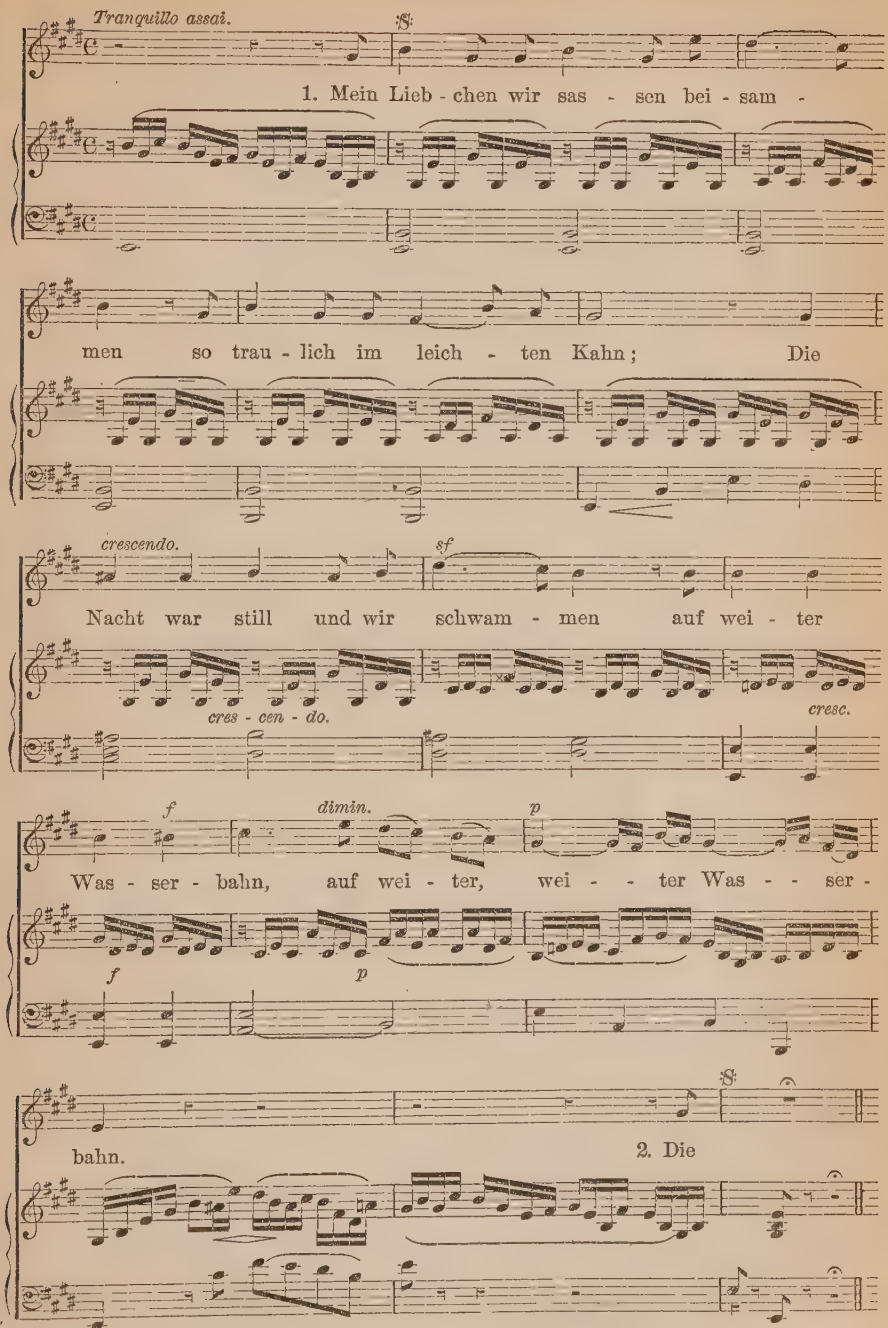
"I have only this corner left to bid you good-by, and to beg for a sign of life and friendship when your time permits. May we soon have a happy meeting. Yours,

"FELIX MENDELSSOHN-BARTHOLDY."

[1] The unpublished song bears the title "Im Kahn," is in E major, the words by Heine, the melody full of charm, with a striking harmony in the accompaniment.

[2] The "missing" in England was equally painful to both parties, but unavoidable, as family matters had kept the Moscheleses in Germany while Mendelssohn was in England.

"LEIPZIG, *July* 2, 1840.



"DEAR MRS. MOSCHELES,—I should have thanked you for your kind, friendly letter by return of post had I only known how to answer your question about our visit to England; but to this day I do not, and it is only to thank you that I write at last, without being able to say any thing decisive. I have for some time felt so tired and unstrung by the constant conducting and performing of music that my doctor seriously advises some few months' rest previous to the beginning of our busy season in October. Of course I shall not follow this advice unless driven to it by dire necessity, so whilst *one* day I hope to go to England, I fear the next that it may not be possible. To-day I must leave for Mecklenburg, where I had promised this long time to conduct a festival, and my coming or not must depend upon the effect this may have upon my health. Should it not tire me more than usual, or should I feel able after it to endure the great fatigue of an English music festival, nothing shall detain me, and come I will. I shall let you know the *when* as soon as I can clearly see my way to the *if*. Pray do not mention all this to any one, for in England every thing becomes so dreadfully public, and goes into the newspapers. I except Klingemann and Chorley, to whom pray mention it, with a kind message from me. You will find that my uncertainty in a matter of such consequence is the best excuse for not having answered such kind letters as yours for so long a time. Do pardon also these unsatisfactory lines; I must make sure that I have no chance of a verbal chat before I can take to letter-writing. A few lines to Moscheles by Mr. ——, in which I gave a preliminary sketch of all this, and sued for my pardon, have safely arrived, I hope? And now farewell, you and your dear ones, and do give Moscheles the very heartiest greetings I have to bestow. Yours,

"FELIX MENDELSSOHN-BARTHOLDY."

"LEIPZIG, *August* 8, 1840.

"DEAR MRS. MOSCHELES,—It is to you I owed the first news of my coming to England, and certainly I should not have owed it long had I not been put on quite a wrong scent by a newspaper article which I chanced to lay my hand on. It said you were at Baden, and that Moscheles had played there, whilst Novello, who arrived here the day before yesterday, knew nothing of the sort. He certainly could not give me the last accounts of you, but assured me you were in England; and presuming you really are, I must write to you this very day to ask your pardon for not having done so long ago, and, besides this, say little more than that I hope for a happy meeting. I can not precisely tell the day of my arrival, for I still hope to bring my wife;[1] and if so, should start in about a fortnight. Should I have to come alone, I shall be in London on the 8th of September, and remain till the festival time, to return immediately after it. I should, in that case, forego my greatest and most coveted joy—that of showing my wife my favorite country and my dearest friends. I fully rely upon your promise of remaining in London during the autumn, and going to Birmingham[2] if possible. What a pleasant, happy journey that might be! How pleased I shall be to hear and see Moscheles again, and to hear and fully enjoy his newest compositions, of which I only get half a description or half a bar doled out to me by some traveller just arrived from London! Sha'n't we make a quantity of music? For *my* part, I am more hungry and thirsty for it than ever. And with my godson and the two amiable, now quite grown-up misses, I shall have to befriend myself anew, but still in the old way, I hope; and perhaps Emily may have a faint recollection of her old piano lessons, and Serena of her old carnations. I even require my godson to remember me at St. Pancras's Church,[3] and call me by my name. But as to you, you will find me sadly degenerated,[4] my English and my gentlemanly manners turned into German countrified ways; and pray do not be angry if I appear unchanged and not improved in other respects. If such thoughts sometimes trouble me, I also think that you too will be pleased to see an old friend again, whether improved or not, whether more or less clever, and that you will continue to bestow your

IM KAHN.

2. Die Geisterinsel, die schöne,
Lag dämmernd im Mondenglanz,
Dort klangen liebe Töne,
Dort wogte der Nebeltanz.

3. Dort klang es lieb und lieber,
Es ward uns wohl und weh;
Wir schwammen leise vorüber,
Allein auf weitem See.

friendship and your good nature upon him as of old. And how the old friend, for *his* part, enjoys the idea of a meeting with your whole house! *That* you know without being told. May it be a happy meeting, then! and do continue to be kindly disposed toward your

"FELIX MENDELSSOHN-BARTHOLDY."

[1] He had to come without his wife, from family reasons.

[2] The Moscheleses went to Birmingham, where Mendelssohn conducted his "Lobgesang" with the greatest success. Other friends of his had come from Manchester and London, and it was "a happy journey" indeed. He was not overtired, and after the last concert of the festival played the organ to his assembled friends in his own masterly and bewitching style.

[3] His godson, Felix Moscheles, was christened at St. Pancras's Church in his presence in 1833; and when Mendelssohn came to London in 1840 he made it a point to have "a game of romps" with the boy, then seven years old, whenever he came to see his parents.

[4] On his first visit to London, in the year 1829, he had to be initiated into many little English ways differing from the Continental ones—an office which Mrs. M. undertook with delight; and although but four years older than himself, took the title of his "grandmother." Ever after, there being no longer any need for it, he delighted to look to her for advice in these small matters.

"LEIPZIG, *November* 18, 1840.

"DEAR MRS. MOSCHELES,—I fancy Moscheles once more comfortably installed by your fireside (this not in any way to be expressed in German). So now I must write and send greetings, and say how often and with what heart-felt gratitude I remember our late meeting.[1] After our separation at the post-office there followed some pleasant days, which Moscheles's and Chorley's letters have long ago described to you. Now, however, that Moscheles has left us by train, Chorley by 'Schnellpost,' a quiet time has set in, with scarcely any thing to describe, for happiness itself is indescribable; and, indeed, I should neither form nor express a wish when I enjoy, as I do at present, health and contentment with my wife and children, and have plenty of work to do; yet we were truly sorry on receiving Moscheles's letter definitively putting off his return to us. He had become quite a member of the family during his short stay, and as such we parted from him. He seems to have become fond of my wife, for such feelings are generally mutual, and I know she took to him the very first day. But when will my prophecy be fulfilled, that you too will love my Cécile, and will at once feel at home and intimate with her? Not this next spring, I fear; and whether Moscheles is so favorably impressed with Germany that he wishes soon to repeat his visit, that too remains to be proved; but I hope he did feel what we all had at heart, what every one of us would have liked to show in word and deed, if not the very showing and saying had been our weak point, but what he will nowhere find more strongly developed—the most heart-felt reverence and love for himself and his work, and the most sincere gratitude for the great and exquisite enjoyment he has procured us. That is still our daily talk, and even little Carl[2] never passes a day without asking papa, 'How does my uncle Moschenes play?' Well, then I try to imitate it with my fists in a flat six-eight time as well as I can, but the result is miserable. [Here follows a song.[3]].....

"I will give the pen to my wife, and only add love to the dear children, to whom pray remind me. That the letter is for Moscheles too, I need not say. How I enjoyed his success at Prague! and how I wish he would sometimes think kindly of us! We hope he will not let us wait too long for the news of his safe arrival at home. Farewell, dear Mrs. Moscheles. Ever yours,

"FELIX MENDELSSOHN-BARTHOLDY."

[1] The "Lobgesang" was performed at the Birmingham Music Festival of that year with immense success, the Moscheleses present enjoying their friend's triumph, and he returning with them to London for a few days. Then Mendelssohn, Moscheles, and Chorley travelled together to Leipzig, and Moscheles had half promised to renew "the pleasant days" spent in Mendelssohn's house after having paid his mother a visit at Prague, but had to put it off, being detained not only by family ties, but by having to give a concert in his native town at the unanimous request of his friends and the musical authorities.

[2] Little Carl was Mendelssohn's eldest child. Moscheles was able to amuse by the trick of *appearing* to play with his fists, while only the edge of his thumbs invisibly touched the keys.

[3] The song mentioned was the "Winter's Hirtenlied," just composed.

"LEIPZIG, *March* 14, 1841.

"DEAR MRS. MOSCHELES,—What an amiable letter of yours that was I received the day before yesterday, written beside the hissing tea-urn, letting me share in the T——'s soirée, and taking me right into Chester Place! The only way to thank you properly for it would be by a song written into the letter; but I can not manage it to-day, and you must take this unmusical, prosaic, dry thanks for your musical, poetical, merry letter. Now is the time when our season draws to a close, and you know by experience how worn out it leaves a man—and a poor musician too (to keep up the usual distinction). Since January we are making music in uninterrupted succession, besides which the Leipzigers are so very sociable that at this time one is scarcely ever allowed a quiet evening at home. Our own house, too, is most merry and lively. S—— H—— has arrived, seems to be pleased with us, and to become a friend to my wife; and now we invite our friends, and they invite us. We speak German, French, and English, all mixed up together; and all the while the orchestra is fiddling, trumpeting, and drumming every day, whilst one is expected to sit an hour and a half at supper and sing four-part songs with roast meat.[1]

As I said before, it is the Leipzig season. The only thing I regret in your charming letter is that you should have taken part in the strange comparisons and 'cock-fights'[2] which have most inconceivably, and to my sorrow, been started in England between Spohr and myself, whilst I never had the slightest idea of such a competition or comparison. You will smile or feel vexed that I write so seriously on such a silly quarrel, but there is something serious about it; and the lengthened competition thus carried on —Heaven knows by whom!—is no pleasure to either of us, but, as I believe, does harm to both. Never could I appear as the opponent of a master whose greatness has been so long tested, for even as a boy I had too much respect for Spohr's manner and himself, and this in my riper years has not decreased a jot. Do pardon me, I repeat, this stupid tone in answer to so amiable a letter; but nothing else will occur to me when I think of that disgusting —— and all his goings-on. And so the Philharmonic Society[3] seems tumbling to pieces. Oh dear! oh dear! how sad that sounds! It is true, they have worried me a good deal of late, still I have a sort of predilection for the old familiar institution, and I still wish they might put the conductorship solely into Moscheles's hands; that would be still their infallible remedy (see Chorley's M. S. receipts). And how are your children? Does Emily keep up her playing? Does she compose? Can Felix still perform his trick of 'dead man,' suddenly dropping down? With us, all is going on well, thank God! My wife has been so well all this time, so entirely without even the shadow of indisposition or complaint, that I can not be sufficiently thankful. There is, however, much to manage and arrange with three little soprano singers in the house, and that is why she asks your pardon for not returning your kind messages herself, but rather through me. S—— desires her very best love, and repeats it three times, emphasizing alternately one of the three words; and I say, should you ever feel inclined to write such a dear letter by the side of the tea-urn, so enjoyable to your distant friends, drawing them into your family circle, then do not quite forget your

"Felix Mendelssohn-Bartholdy."

[1] Every musical family wished to receive Mendelssohn with due honors in a musical as well as a culinary way; that is why he speaks of four-part songs with roast meat. They were his own songs, all the musical amateurs had studied them, and it was meant as an attention shown him to sing them at table. And as to the "culinary" honors, the following anecdote was told: A lady sent for the best waiter, well known as such, and employed at most parties, and calling over the "menu," she ended by saying, "And a lemon cream tart—Dr. Mendelssohn's favorite dish." "Oh, ma'am," exclaims the waiter, "any thing but *that*; Dr. M. has had it three times last week at three different houses."

[2] The *Spectator* was edited by a gentleman who in his reverence for Spohr thought that he could raise his fame by lowering Mendelssohn's. The performance of Spohr's new oratorio, *The Fall of Babylon*, was the occasion of his freely venting his feelings on that head. Other papers took Mendelssohn's part, and that brought on the "cock-fights," which so seriously annoyed Mendelssohn and his friends.

[3] The Philharmonic Society of that year had but two-thirds of its usual subscribers, and many musicians and amateurs thought that reform was wanted to raise it again; that it would be beneficial to do away with the custom of each member of the society conducting in turn, instead of having one and the same conductor for all the concerts; and Chorley, editor of the *Athenæum*, strongly recommended Moscheles as worthy to hold that post. It was, however, not till after many reverses that it was offered to him, at first refused as coming too late, and at last accepted for the sake of conducting the Ninth Symphony, which, after having been laid aside as "impossible," met with the greatest success in May, 1841, under Moscheles's conductorship, calling forth much praise in the public press.

"Berlin, *October* 8, 1842.

"Dear Mrs. Moscheles,—I am back again these three days, and write on this broad sheet of paper—*you* know what; but I write it in fear and trembling, for my mother assures me she knows from yourself that you intended leaving Hamburg the beginning of October to return to England, without stopping either at Leipzig or Berlin. That would really be too bad! But I can not quite believe it, and so venture to write you a regular letter of invitation:

"'Mr. Felix Mendelssohn-Bartholdy presents compliments to Mr. and Mrs. Moscheles and family, and is most greedily longing for Mr. and Mrs. Moscheles's visit to Berlin for at least a fortnight. Fine country views, music, and that sort of thing, he can not, it is true, offer them; if, however, a most hearty welcome can make the sandy soil appear fruitful and the musicians fiery, they might find an improvement even in *that* way. The whole population of No. 3 Leipzigerstrasse joins in this most humble invitation. Dinner on the table at three o'clock. *Il y aura un violon.*'

"I wish you would say 'Yes,' and come. How happy we should be!

"But, joke apart, dear Mrs. Moscheles, and your dear friend, should you still be in Hamburg, and these lines reach you there, then do not break our hearts by passing us by. Had I but known a little sooner when I should be here again, I should have written ere this, but we returned only four days ago from our tour in Switzerland and the south of Germany; every thing was uncertain, as it is still. However, here we are, and shall certainly remain for the next fortnight, and so I repeat, Come, come, come. I wish I could inclose a starling that could say, Come. The only musical novelty that I should have to show you, dear Moscheles, would, it is true, be the melody ['Lied ohne Worte'] in A major, which you heard more than enough last spring. Since then I have not been able to write any thing new

for very eating, drinking, walking, sketching, laughing, and leading an idle life. But you, I am sure, will have to show me the most lovely new things, and that will be better for us both. But supposing even we were to make no music at all, if we could but spend a little time together in Germany more quietly, seeing and hearing more of each other than is possible in a London season—with you because of too much work, with me because of too much idleness. You would meet Klingemann too; I am daily expecting him to announce his arrival. He must have been in Hanover ever so long. As I said before, if you did but come! Now that our wanderings are concluded, we feel all the more what a happy summer we have spent, what English[1] comfort we have enjoyed, what happiness, what never-to-be-forgotten kindness, we have experienced. It was delightful indeed! And then, on our return home, we could not help saying that in the whole five months in which we wandered over land and sea, by steam or on muleback, across roads and rocks, we could not remember one unpleasant moment, not one dull day, but that we had been able to enjoy every thing in undisturbed delight and health. Then I felt as though we never could be thankful enough, as though we ought never to pray to Heaven for any thing but a continuance of it, and as though it was a kind of ingratitude to talk of making 'three crosses' over it, or fearing to destroy the spell by mentioning one's happiness, for such thoughts would be foreign to real deep gratitude. This joy and these thanks have been alive in us ever since the beginning of our tour, and can not be extinguished all our livelong days. In Switzerland—oh, about that I could talk for whole evenings, till you were quite worn out—how very pleasant it was there! Then came a delightful fortnight with the S——s at Frankfort, then Leipzig and the first subscription concert. They flattered themselves you would have come to it, dear Moscheles, for David told me they had asked you particularly. Hauptmann had his first mass performed at St. Thomas's Church; three new violin quartettes by Schumann were played to me, the first of which I liked exceedingly. Madame Schumann played in public Weber's *Concertstück* and some Thalberg with as much beauty and fire as ever. Here, thank God, I found all my dear ones well; music, sad to say, very unwell. They are performing *William Tell*[2] for the wedding festivities, curtailed into three acts, and call it 'the composer's arrangement for the Parisian stage,' racking their brains to discover whether Rossini had any call to write operas or not. The white beer, the hack carriages, the cakes, and the officials are wonderfully good, but not much besides.

"I have petitioned the king for an audience to say if he will be graciously pleased to let me leave Berlin again, but have not been able to obtain it this week on account of the marriage, his journey, etc.[3] Should he grant my wish next week, I shall hope to be in my well-known Leipzig abode in another fortnight; but my dismissal must be a gracious one. I love him too much and feel too grateful to him to leave in any other way.

"Oh, how I am running on! Can you forgive me? I dare not touch the next page, which Cécile claims. Then let me add on this one love to the children and my wishes for your welfare, but, above all, the wish for an early and happy meeting. Ever your

"Felix Mendelssohn-Bartholdy."

[1] Mr. and Mrs. Mendelssohn had spent some time in London in the spring of that year, where they met with all that friendship, kindness, civility, and admiration could procure for them. They were staying with *her* aunt, Mrs. B——, at Denmark Hill, but also spent a few days with the Moscheleses. There were numerous public concerts, at which Mendelssohn and Moscheles played together; private parties at the houses of musical friends, where they delighted their audience by the music of *Midsummer Night's Dream*, arranged for two performers on one piano, and other duets where Miss Kemble sang Mendelssohn's songs; but the most intimate evenings, where he and Moscheles improvised together, were enjoyed particularly by Mendelssohn. How they managed to do it they scarcely knew themselves. One of them would start a subject from the other's works, but before he had ended in varying it he would be interrupted by his friend starting one of *his* subjects; passages were invented by *one*, accompanied by the other; and if some jarring harmony did occur, Mendelssohn was so convulsed with laughter that he could scarcely continue.

[2] Mendelssohn had a high opinion of Rossini's *William Tell*.

[3] He *was* graciously allowed by the king to leave Berlin for Leipzig.

"Baden-Baden, *June* 9, 1847.

"My dear Mrs. Moscheles,—When I received your dear kind letter, and could not answer it at once in the hurry and scurry of the last London days, I pictured to myself the pleasure of writing to you in a cheerful, pleasant tone from some favorite place in Switzerland, perhaps with illustrations or something of the sort. Now all that is changed. You know the heavy affliction which has befallen us, and how our inward and outward life has been shaken in the most distressing way, and to its innermost depths, for this long, long time, perhaps forever.[1] I am sure you have sympathized with us in our irreparable loss, although you and Moscheles knew but little of my sister. You can fancy, however, what I feel, to whom she seemed present at all times, in every piece of music, and on all occasions, good or bad. Indeed, such is the case with us all; words are nothing at such a time; and yet I can not speak of any thing else. Forgive me, then, if these lines contain little else than hearty thanks for the

letter above mentioned, which was another kindness added to the many which followed every step of my last visit to London.

"We shall not go to Switzerland under the circumstances, for we could not enjoy ourselves, and probably I shall return to the North sooner than I intended. I often feel forcibly drawn to Berlin, where my youngest sister is now all alone. My brother has been here for the last week, and, it is true, nothing can do us so much good as our walks in the woods and being a great deal with the children. He has brought his own with him, and they as well as mine are in excellent health and spirits, and delight every body who sees them. Cécile, too, is quite well, thank God, but deeply afflicted, like ourselves.

"I hope to hear a favorable account of the result of your present visit to England,[2] and do not, pray, remain too long, that the Leipzigers, and, above all, those P. F. pupils, who are most anxious for improvement, may not lose their chance. The Londoners will, I believe, say the same thing; but you have spent so many years with them that you must now do something for the German cockneys, or country cousins, or whatever you may choose to call them, whose faults I know as well as any body, but who have also their good and admirable qualities, provided one can get over their cockneyism and their antiquated ways. But that requires time, and it is for this reason I wish you would not stay away too long. To become used to these oddities? you say. To help more and more to destroy them, say I. Remember me kindly to all our dear English friends. I need not say that this letter is meant for Moscheles as well. Heaven grant you and yours health! and remember kindly your

"FELIX MENDELSSOHN-BARTHOLDY."

[1] This letter was written after the death of his eldest and favorite sister Fanny, married to the artist Hensel. She is said to have composed some of the "Lieder ohne Worte," published under his name. It was she who, musically considered, understood him best, and it was thought he never quite recovered the shock caused by her death, which was a most sudden one, rendered doubly painful by occurring in his absence from Berlin, and at one of her own musical matinées.

[2] The Moscheleses were in London to receive their first grandchild, but returned soon after the happy event, Moscheles having become, some nine months before, Professor of the P. F. at the Leipzig Conservatorium.

A STORY OF THE PLAGUE.

SOME time in the first twenty years of this century one of the Van Horns of New York, with an Irish gentleman named Daly, made a tour of the Southern States. The men were friends, young, shrewd, and energetic; they had each a moderate capital to invest in manufacturing purposes, and were strongly tempted to try the South as an unbroken field for their enterprise. They were so hospitably welcomed every where as to make their journey a kind of triumphal progress. Being young, they drank, diced, flirted, and went with equal zest alternately to camp-meetings and to races; but, being shrewd, they brought their money home again to invest.

"It will never do, Daly," said Van Horn. "It is the wagons for these very plantations which we mean to make. Here is the lumber, the water-power, cheap fuel, and cheap labor; but, for all that, we must go a thousand miles away to make the wagons."

Daly nodded and laughed. The end of the matter, as far as he was concerned, was that he invested his money in the Northern wagon factory, but that he married and settled in Alabama. There was something that reminded the Irishman of home in the establishments of these lavish land princes of the Gulf States, in the great wooden cabins in which they lived, with the rain dripping through leaky roofs upon magnificent beaufets heaped with silver plate, where dogs, naked negro babies, and fleas ran riot over the bare floors, and beautiful women with ill-fitting gowns and rivers of diamonds about their shapely throats looked lazily on. Back of this dirt and splendor was the negro background—hundreds of half-worked slaves, and a nature tropical, rank, sensuous. Daly relished with keen appreciation every feature of this life—the gambling, duelling, lavish generosity, devout church-going, passionate love of family. To Van Horn it was all alien and distasteful.

"I tell you," he said, vehemently, one day, as they discussed it, "there is a stupor in the moral atmosphere, like malaria in a sunny air. It is rather agreeable, I confess, in the rich planter. It is a virtue when it shows itself in his princely hospitality and good humor. But see what it does for these poor whites in towns, the same class that with us would be mechanics, shrewd tradesmen, or—"

"Shrewder thieves?" suggested Daly.

They were walking, as they talked, on the wharf of a border town on the Ohio—a town which has since been converted by Northern capitalists into a mass of iron foundries, but which was then a drowsy village. The pigs tramped leisurely through its one long muddy street, or rooted under the porches draped with roses and red honeysuckle; black puffs of smoke from the low stern-wheeled boats at the wharf drifted lazily up against the hills that walled in the town with ramparts of splendid autumnal color. The wind, blowing from off the river, was cold and bracing; there was a smell of bitumen in it. The red brick of the houses was streaked with sooty shadows. The same bitumen colored the clouds

until they lay in masses of intense crimson and emerald up higher and higher against the blue roof overhead.

Van Horn glanced critically about him. "Just look, Daly!" he said. "Nowhere is nature more prodigal. These hills are full of coal and minerals; the soil is rich as that of the West Indies; yet nowhere will you see such contented poverty. See that fellow!"—touching lightly with his foot a lazy fat lout who lay stretched on a pile of hogsheads. "That's a fair specimen of the class—ignorant, ragged, and brutal. I'll wager any thing you choose that he will go on sleeping in the sun until the end, and die as much of a brute as ever."

Daly glanced at the boy, and the generous color rose to his cheeks. "Nothing of the kind," he said, hastily. "This lad has as good stuff in him as you or I, and he means to be a man. Come on; it is nearly time for the boat to start. You ought to be careful, Van Horn," he said, when they had passed up the wharf. "That boy was not asleep, and you cut him to the quick."

Looking back, they saw that he was standing watching them. A few minutes later they came down from the hotel to go on board the little steamer which lay puffing and snorting at the landing, and Daly caught sight of the boy, again standing apart from the crowd, looking eagerly at him.

He was Zack Nealy, a "bound boy," who drove a dray for Pettit and Clay, a forwarding house upon the wharf. He wanted to see this gentleman again who had said he had the stuff in him of which gentlemen are made. Zack probably had never thought of himself before as any thing but the driver of a dray. He was keen, eager, and, like Daly himself, he had a drop of Irish blood in him. There was not a point in this good prophet's face, figure, or bearing which he did not note—the gallant carriage, the steady eye, controlled voice, even the set of the long, rich, fur-trimmed surtout.

The boy's heart was beating like a drum hard against his chest. "As good stuff in me! Be a man like that—like that!" He did not open his lips, but it seemed to him that he was shouting aloud with excitement.

Daly stepped over the gangway, and then as the boat shoved from shore looked again in the crowd for the boy. He had said what he did from mere compunction and the good-natured wish to atone for Van Horn's heedlessness; the same kindly pity filled his mind now, and made him, when he caught the lad's eye, smile and raise his hat as he would do to an equal.

Zack stood stunned for an instant, then he took off his old hat.

"He shall never be ashamed of having done that to me!" he muttered, walking down the wharf to keep the boat and the fur-coated figure on deck in sight. He followed it for a mile or two, until it swept around the bend and was lost. Then he sat down among the papaw bushes on the shore, his hands clasped about his ragged knees, his face red, his half-shut eyes speaking new thoughts.

An American "wharf rat" would have been immensely flattered by this thing, and have forgotten it in a day. But there is a good deal of germinating power in hot Irish nature. Put a live idea into it with a kindly touch, and you will be sure to hear of it years afterward.

The live idea had come to Zack.

The sun went down behind the Ohio hills on the other side of the river; now and then there was a plash in the shallow, dun-colored water as a greedy pike chased the minnows up to the bank; a black beetle toiled painfully over the red and yellow bed of pebbles at his feet; a brown squirrel peeped out of the purple iron-weeds behind him. Zack winked back to the tiny shining eyes. "Even that darned little rat wishes me luck," he thought. He sat thoughtfully shying pebbles into the water, and chuckling aloud now and then. A few rods further down the river were the sheds under which the Pomeroys were trying to make window-glass. Some of the workmen had come out half naked from the furnaces, and were lounging about. Zack knew them all; he often ran for their drams, and drank with them.

"Here, Zack!" one of them called, holding up a stone jug.

He shook his head. "They're as good friends as I've got, but I'm a-goin' to take another track now."

His new purpose seemed like fire burning in him. He got up and walked restlessly up and down.

The men went into the mills. The sun had gone down; a damp twilight was gathering. Only a pale yellow glaze lingered above the line of Ohio hills, and a red pillar of flame rose from the chimneys of the works. For the first time in his life the boy felt quite alone in the world. This desperate venture seemed impracticable in the night; it took his breath to think of it. It would be so much easier to go on to-morrow driving the dray, boarding at Mrs. Taggart's.

At that moment there came from the other side of the river the sound of music—an air played on a violin. It was a Highland call to battle, full of rough vigor, and a strange melancholy underneath. At another time the lad probably would not have noticed it, but his Irish imagination was at fever-heat now. It seemed like a voice calling to him. "Come up higher," it said—"higher."

He listened, without moving, until the

last note died away. Then he rose slowly and went back to the town. He used to say, for years afterward, "It was an air on a violin that was my salvation. I'd give five years of my life to hear it again."

The road upward before an ambitious poor boy was broad and easy enough among the generous Southern people at that time. It was only necessary for Zack to go, as he did the next day, to his master and employer, and say boldly that he wanted an education, and the chance to make a man of himself. Colonel Pettit looked at him with lazy astonishment, then clapped him on the back.

"By gee, Sir, I didn't think it was in you! I'm deuced proud of you, Zack, by gee!—pervided it lasts overnight. Well, Sir, if you really mean the thing, you kin count on Josiah Pettit."

The colonel gave him half of his time and a wheelbarrowful of old school-books. Every body helped the boy, every body advised him. A boy who actually wanted to study, to work, to push himself on, was a black swan in the little town, of which it was lazily proud.

Through this sunny, sluggish atmosphere, therefore, young Nealy urged his way for seven years. Colonel Pettit cancelled his indentures when he was sixteen. He was by turns clerk on a river boat, a teacher, and shipping overseer for Pettit and Clay. Finally he took the course usual then with lads in the smaller Southern towns. He set out for the river cities, armed with a sheaf of "circular introductions" from business men, and money enough to support him for a month. In those halcyon days this was enough outfit for a boy going into the world to seek his fortune. The larger towns were ready and glad to absorb the vigorous young blood of the provinces. Zack had situations offered to him in Cincinnati and St. Louis, and accepted one in the house of the Chouteaus in the latter city. While there he studied medicine in his spare hours, and saved money to pay for two winter courses of lectures in Philadelphia. After that he practiced in the hospitals, and settled at last in a growing town of Western Pennsylvania. He was strongly minded to go back to his old home. Every man in it was his friend. He would rather have tramped over its muddy, sooty streets than have trod on fields of thyme and roses elsewhere. The very smell of its greasy smoke was sweet to his nostrils. But Colonel Pettit advised him not to come.

"A doctor must have a certain prestige," he said. "He must be the social equal of his patients. Now we're all mighty proud of you, Zack; but—"

"I understand. That's all right," interrupted Nealy, biting the end of his mustache nervously.

"That thar dray, you see? It's ondyin', that sort of remembrance, with Virginians."

So Nealy, not without a certain angry ache at his heart, settled among strangers. One or two lucky hits soon discovered to the public of Finnburgh that he was far in advance of its two old physicians as regarded modern science. He showed an old-fashioned, distant courtesy toward women, too, very winning in a young man. With men, on the contrary, Zack was an inveterate talker; the Irish gift of telling anecdotes was an unknown art in slow old Finnburgh, and Zack, having knocked about a good deal in the world, had a capital story to fit every occasion. Before a month had passed, every man in the borough felt himself in some sort a partisan of this jolly, stout, Jewish-faced young doctor. He was asked every where to dinner, to tea. Most of the eligible young women of the county were discussed as suitable wives for him. You heard his gay, infectious laugh every where. The truth is, the fellow was thoroughly happy in his new quarters. This friendly recognition was the success which he craved. At heart he was still the homeless boy, hungry for companionship and affection. As for money, he took no account of it—not even enough, his enemies said, to pay his debts; which, by-the-way, I am afraid was true. Nealy was Irish.

When he had been settled in Finnburgh for a year, the Shiras family came into the neighborhood. They were of English extraction, and belonged to a race of scholars. There did not seem to be much money in the family, yet the men belonging to it took no means to add to its income, but went on with their leisurely researches into the life of ancient Greece and the habitat of spiders calmly as if they had been millionaires. It was a new idea to Nealy—as it would be to most Americans—that men of straitened circumstances could find other and higher employment for life than the making of money. It pleased him immensely. He went often to the plain little cottage back of the pines. The repose, the unfathomed culture and wit hinted under their careless, trivial talk of every day, the mere fact that the stock of this family had been honorable gentlefolk for centuries—it was all a glimpse into a new world to Nealy. This was the Brahmin class which he had longed to enter. He watched the daughter of the house, Priscilla, at first with a kind of reverent awe and wonder, she being, as he thought, the highest type of this high class. She was not naturally as clever, probably, as the young girls of the town; but she had not an idea in common with them. Their talk was of house-work, of vulgar finery, and vulgarer flirtation. Priscilla knew no more of these things than of the squabbles of the fish-women on the river-bank. She had spent

most of her life in travelling through the beautiful places in the world; her companions were men who dealt with great facts and ideas. They had hedged the girl in from all rough unseemliness with a fine courtesy. In Zack's view she dwelt apart upon a height; it did not, indeed, at first occur to him that he could ever climb to a level with this young gentlewoman. Her father and uncle made a companion of Dr. Nealy. They found a genuineness and delicacy of feeling in the young fellow which were different from the other Finnburghers.

"He is undoubtedly a man of good breeding and birth," said Mr. Peter Shiras one day.

"On the contrary, he has hinted to me that he has struggled up from extreme poverty," replied Priscilla's father.

"That may be," retorted Uncle Peter, taking off his eyeglasses. "There were many scions of good families who landed penniless in Virginia. I never am mistaken in the species of a man, any more than of a spider."

For three or four months young Dr. Nealy's mind was full of his new friends, whether he was in market, or in church, or at the bedside of a patient. He thought, probably, that he was studying them as a species, Miss Shiras being the best specimen. He had that sense of ownership in them which we have in a fine landscape which we alone have discovered. He could not tolerate the mention of them from any ordinary Finnburgher; and when once a decent old farmer spoke of "that daughter of Shiras's," though he did it respectfully enough, Zack could scarcely refrain from striking him.

He did not know what this meant until one day late in June. He had gone out with a night moth to Mr. Peter Shiras: he had fallen into the habit of taking out specimens after his last round of visits was over. It only needed a few moments for Uncle Peter to prove to every body that the specimens were worthless, and then they would have tea under the pines, while Priscilla, in her pale blue dress, sat at a little table and filled the cups.

This evening she was not at the table. Nealy glanced quickly around while he was talking of the moth. He saw her riding down the road, a tall, soldierly-looking man beside her.

"That is Henry Shiras," said Uncle Peter, following his eye, "a cousin far removed. There was some plan when Miss Shiras was a child of a betrothal between them. But the young people settle such things altogether for themselves in this country. No, no, Dr. Nealy, you are quite mistaken about this moth. Look at its antennæ."

Then it was that Dr. Nealy first knew what had happened to him. He went home, promising to come back later in the evening. It was a very comfortable, even luxurious, home to which he went. A little money could command much in that cheap neighborhood. In a city the house, with its slopes of lawn and forest about it, would have been reckoned a stately dwelling. Nealy went restlessly up and down the halls and chambers, trying to reason to himself. What had he to do with the Shirases, or their marrying and giving in marriage? He had filled up his thoughts and life with them lately, but he was apt to be vehement in his friendships. He had even furnished this house as he had fancied Priscilla would have done had it been hers, but that was because she was the only woman of her class that he had known, and he wanted to raise himself to her level.

Was that what he wanted?

No, a thousand times no! He wanted her —*her*—the woman herself! Soul and flesh and blood.

He saw his abject folly now, and the extent of it. Presently he went down to a hedge bordering the road where they must pass. When he saw them coming he crossed it and stood out on the wagon track. It seemed to him as if he could wrench the secret from her by a look, and know what he was to her, whether all or—nothing. He could not wait an hour to know it. Other men might woo gently and slowly the women they loved, but Nealy had the instincts of his progenitors, who carried off their wives by one fierce assault. Besides, he never had loved before, and there was all the force and depth in his passion which other men spend in fancies and flirtations from their schooldays up to middle age.

Miss Shiras, as she came up, was looking down, shyly listening to her cousin. She glanced at him when he paused, an admiring smile lighting her delicate face.

"She has listened to me with her head drooped in that way a thousand times," muttered poor Nealy, "and smiled in just that fashion when I had done. What does it mean?"

It only meant that Priscilla was a well-conducted young woman; deferential to all men as her natural superiors; of an affectionate, dependent disposition, too, and apt to cling to the last person who talked to her.

Mr. Henry Shiras naturally was startled by the apparition of this stout, haggard young man in the middle of the road, who took off his hat as Priscilla passed, and forgot to put it on again. Zack was torn and controlled by this feeling which had broken bounds as absolutely as if he were a boy of sixteen.

"Most extraordinary behavior!" exclaimed Mr. Shiras. "Who is that person, Priscilla?"

Miss Shiras flicked her horse's ear nervously with the whip. "Oh! that is Dr.

—a man whom papa has noticed a good deal lately. A very nice person indeed, Henry," in a stronger voice. "Uncle Peter thinks him an admirable judge of moths."

"Better judge of moths than of manners, I suspect. What does he mean by staring after you like a maniac? Another specimen of that insolent American familiarity which you all seem to relish so much."

"I do not relish it, Henry," said the gentle Priscilla.

"Why, you were commending this fellow just now."

"Oh no! I said he was very clever as to moths. But his manners, of course— He *is* an American, you know. He has had no opportunity of discovering the difference between himself and a thoroughly well bred man." Her soft eyes were fixed thoughtfully on her cousin's face. They gave the meaning to her words.

They stopped at the cottage just then, and when the soldierly young fellow lifted her from her horse, she smiled confidingly back to him. Yesterday Nealy had lifted her from her horse and received the smile. Not that there was a grain of coquetry in the girl. But her cousin Henry was so soldierly, so friendly, so English, while Nealy —yet really Nealy's only fault was that he was out of sight.

Not out of hearing, however. The hot-headed doctor had followed them down the dusty road, and heard much of their criticism on himself. It did not hurt nor even surprise him that Priscilla spoke thus of him. Wasn't it true? What was he but a bound boy, a drayman aping the gentleman? She knew it—she, standing on her height. As for Henry Shiras, he did not think for a moment of the man. He—all other men were nothing to him. The world was empty but for himself and this girl.

Nealy stood hidden by the lilac bushes while young Shiras took leave of her and cantered down the hill. She stood irresolute a minute in the doorway, and then, turning into the library, she sat down by the piano and began to sing softly to herself. Her conscience feebly troubled her. She should not have ridiculed Nealy, who was—was— What was he to her? She smiled in a faint, decorous way as she asked herself the question.

The twilight had fallen. Zack, from outside, could dimly see the neat, slight figure, the fine, fastidious face. Great God! the gulf between them! She was to him just then all that was rare, high, unapproachable; as for himself, all his old poverty, ignorance, brutality, as Van Horn had called it, were present, and hung about his neck like a millstone. He groaned and turned away, when she struck the keys again and played an old Highland air. He stopped; he had heard it once before. It was the music which had long ago seemed to say "Come up higher" to him. Zack listened, hesitated, then it seemed as though new blood had rushed into his body. Pushing through the bushes, he entered the house.

If Nealy had wooed Priscilla after the conventional fashion of Mr. Henry Shiras and his like, he would have failed. He could not speak any alien tongue. But the poor fellow, being desperate, bared his heart to her, and, what was more, bared his life. The Irish hovel, the dray, the barefoot boy on the wharf, the long struggle upward— he told the whole story, and, as we know, he could tell a story well even when his life did not hang as now upon the words. Priscilla was gentle, affectionate. She had, too, a little cool spark of imagination somewhere; it kindled and burned. This was no ordinary man; it was a hero. This was the old story of Cophetua and the beggar-maid reversed. The idea of her marriage to Dr. Nealy was not new to her. She had considered it frequently in her calm, systematic way. In all probability she must marry an American; Dr. Nealy's present position was equal to her own; his house was very handsome, and he himself— She glanced at him, and blushed in a way that maddened him afresh. Henry Shiras? But Henry could not marry for years, and she was not, indeed, at all certain that he wished to marry her then.

All this while Zack poured forth his honest passion, his humility, his adoration of some goddess of a woman.

"Does he really mean me?" thought Priscilla. "He will always regard me in that way, our social positions being so different."

Then it being time for her to speak, she told him, with a proper shyness and blush, that she preferred him to all other men as a friend, but that if he wished for more he must talk to papa, "though" (this with an arch smile) "papa is so involved in business with the ancient Greeks that he will not be likely to oppose *our* wishes."

When he caught that emphasized word, Zack took the cool little hands in his and kissed them, and could have cried over them, his heart was so full.

Two years later Dr. Nealy sat, one warm evening in July of 1832, on the porch of his house. His wife was beside him. Her chair was placed so that the vine of pale pink roses trailed over her delicate head, with its neat crown of chestnut hair. It was Zack's fancy to always place it there.

"So absurd!" Priscilla said to herself. "Just where the bugs can drop on to my collar!" But to him she said nothing. These whims and fancies, even his hot Irish affection, were the product, she thought, of his vulgar condition in boyhood. She would

not waste her wifely authority on trifles. When the vulgarity showed itself more offensively, it would be time to interfere. She was very fond of him, but she was always on the watch for it to show itself.

As for Zack, his boyhood or his old age troubled him very little just now. He had just eaten a good dinner, and begun a new pipe; his eyes were on his wife; his home was comfortable, his pocket was full; in the village he had all kinds of friends and jolly companions to make his life secure and happy. There, according to rule, we ought to leave him. But there is one short chapter more to give, and it began that day on the porch.

"I don't see," he said, reflectively, "how God could do any thing more for me, Priscilla, or bring me any higher up. Unless—well, I should have liked to see a little fellow skirmishing around here. I've often thought if I could only see a baby's head on your breast, Priscilla, as on other women's—" There was a grave, eager longing in his face.

His wife pursed her thin lips. "You often make a strange choice of subjects, Dr. Nealy. This is especially distasteful to me. I suppose Providence orders our lot for the best."

"Oh yes, Providence— By George! there's Lloyd! I thought he was in Virginia. I'll go to the gate and meet him." He hurried away, glad that Lloyd had appeared just then. His bursts of enthusiasm usually received little dashes of cold water such as this.

"I'm a rough brute, after all," he thought. "But God knows I meant well."

Lloyd, who was a physician in Finnburgh, did not come in. The two men stood at the gate talking a long time—so long that Priscilla grew uneasy.

"The dew is falling, and he has no hat," she said, and found it to take to him. As she came down the path she saw that both men looked grave and anxious.

"Not a word to my wife," muttered Zack; and they turned smiling to meet her.

"You are discussing some serious case?" she asked, putting Zack's cap on his head.

"Yes, Mrs. Nealy."

"Then you do not want me. Come in soon."

When she was out of hearing, Zack said, "There is no doubt as to its being genuine Asiatic cholera?"

"None whatever. It has swept through the lower part of the town. You know where I mean?"

"By Pomeroy's mills. Yes, I know every foot of ground and every man in that town. I was a boy there, you know. Well?"

"Every body who had the means to go, fled weeks ago; but the poor whites and negroes are there, and they are dying by the hundreds every day. No boat stops now. I heard the account from Clapp, who escaped on foot, and boarded our boat at Steubenville. He says their condition is horrible beyond belief: the dead lying unburied for days, until they are carted off and thrown into a pit together; want, starvation, among the living."

There was a gathering horror, even fear, in Nealy's face. "Why, Lloyd," he said, "those people were like my brothers once. Want—starvation?"

"Oh, I mean the lower classes—mill hands, workmen."

"So do I."

"The well-to-do people, I told you, have fled. There are no nurses, Clapp said, and but one physician."

"But one physician!"

Nealy, who never could keep still when greatly moved, walked abruptly away. It was some moments before he came back. Dr. Lloyd was watching him anxiously.

"What are you going to do?" he said.

"Good God! what can I do? Go to them, of course. But one physician!—and I here, swilling my sherry and smoking my pipe!"

"But your wife?"

"Priscilla! Yes. I—I had not thought of her."

"Of course you have not. You have not thought at all. It is a noble, generous impulse, Nealy, but not your duty. Think it over, and you'll see that."

"There is a stage at midnight to Pittsburgh?"

"Yes; but you will not take it. Tut, tut! Do you suppose the town here can spare you, or your friends, or your wife? Go in and talk it over with her. I'll call on my way back. It's not your duty to make yourself a martyr for these wretches. Their houses are filthy, and they are drunkards; so down they go. Let them go."

As the old doctor rode down the hill he looked back and saw the stout figure motionless at the gate. It was late when he returned. Seeing a light in the office, he made his way there. Nealy met him at the door.

"You have determined to go?"

"Yes."

The old man was greatly agitated, while Nealy was quiet.

"You will never come back, boy. Going from a pure atmosphere into that polluted air—"

"Nonsense! I will be at home again in a month's time, please God. There are some papers I will leave with you. My—my will. Something might happen, you know. It is all arranged for Priscilla. She will be comfortable as to money. I should not think it right to go else."

"Money! What is money compared to the loss of—"

"Of me?" Nealy passed his hand over his

face. "Don't unnerve me, Lloyd. It's right for me to do this thing. I can't turn my back on these dying people. I've thought it all over."

"What are we to do without you, Zack?"

Nealy smiled. "Yes, I know I'll be missed in old Finnburgh." Then his eye fell on his wife's closed door. He began to gather up his papers, his lips turning pale. "It's right for me to go," he said, roughly. "Don't make me think of what it costs me."

There was a pause. "Does she know?" asked Lloyd.

"No. I can not say good-by to her. There is a letter for her with the other papers. Now go, Lloyd. Wait for me at the inn until the stage comes." He went with Lloyd out on the porch; then he unclosed the shutter of his chamber, and looked in at his sleeping wife. If he opened the door it would waken her. The moonlight shone softly on the fine, somewhat hard face. Zack saw no hardness there.

"Dear little tender heart!" he said, the tears running down his rough cheeks. He had been too coarse for her. When he came back he would try harder than ever. When he came back? What if he never entered that room again?

An hour later the stage going south stopped at Finnburgh and took in a single passenger.

It was the 1st of September, and the plague was over in the little river town. The smouldering fires of tar still burned along the streets, but the houses were flung open, young girls were singing inside, children playing; the gardens were gay with prince's-feather and fall roses. There was but one case reported to-day—the young doctor who had come to their help weeks ago. A crowd had gathered on the porch of the inn, most of them mill men and negroes whom he had nursed and cured. They stopped Colonel Pettit as he was going up to his room.

"How is he, colonel?"

"Tanner thinks he's sinking. But he'll pull through. There's no justice in Heaven if he doesn't pull through!"

Tanner, the one physician who had staid to fight the pestilence, met him on the landing. "Well, Sir—well?" cried the colonel.

The doctor shook his head. "Reaction with fever. You know what that means."

Pettit nodded, groaning. "It's God's work, I suppose. But *I* don't understand it. Why, Tanner, Zack Nealy has pushed his way up and up, since he was my bound boy. He is a man of education and means; he has a wife that loves him; he came here and saved hundreds of lives, and he's shoved off—dies like a dog! By gee, Sir, I don't understand it!"

"He's a merry, affectionate fellow," said the doctor, who was not given to abstract discussion, "joking between the paroxysms. He talked of his wife to me to-day with that awful tenderness which a mother has for her child. You'll stay with him until I come back?"

"Yes." The colonel went in and the door closed behind him. Hour after hour passed, and the crowd still waited, carrying the reports of his condition out to the town. Zack, who had left them long ago and came back to die for them, was the hero of the hour. About sunset an ominous silence fell on the place. The crisis had come; there was a chance that he would recover. A band on a passing boat played as they floated down the river an old air, a Highland call to action. It must have reached the dying man. A few minutes later Colonel Pettit came out.

"It's over, boys," he said; "Zack Nealy's gone—gone higher than I can follow. God help me!"

FRENCH FARMERS.

IN the summer of 1878 I boarded for a time, not one hundred miles from Lyons, with a family of that class who themselves follow the plough. I call my hostess, in the French style, Madame Widow Lesmontagnes. Her only daughter was married, but her three sons were at home. We will call them Pierre, Charles, and Henri. Pierre was a soldier in the Prussian war, where he lost his health, and is no longer considered fit for severe labor. The greater part of the farm is rented, and only a small portion kept for Charles and Henri to cultivate. They are people at ease in their circumstances, the grandfather of the young men having been enterprising—a merchant of wood, hay, and cattle. He made money and bought this house, which once belonged to a noble family, the De Bresoles.

Like almost all the farm-houses that I saw in France, that of Madame L. was of only one story, the garret being the granary (*grenier*). There is a large kitchen, and four other large rooms, all with brick or tile floors. The walls of the house are about twenty-eight inches in thickness, and the ceiling of my room is about twelve feet in height. The house was probably a grand one in the time of the De Bresoles. Now there is a bed in the dining-room, one in my great ground-floor room, and two in Madame L.'s. There is not a piece of carpet seen in the house. There is no looking-glass in my room, and when I venture to speak to madame about it, she says that she has a large one and will let me see it. I go into her room, and there is an ancient one, about two feet one way and fifteen inches the other, set in the wood-work above the chimney-piece, with a narrow gilt frame. Paris is

wonderful in the display of looking-glass, but the Parisians look down on the provincials. The front of the house opens upon a yard. To call it barn-yard, well-yard, wood-yard in one will describe it. We enter at a great gate on one side, and as we come in, the house is on our left. On the side that we enter is the barn, in which is also the wine-press. The other two sides of the yard are formed mostly by low buildings, all the buildings being of stone, with tiled roofs, the predominant color of which is red. These low buildings are the pigs' pen, the hen-house, the wood-shed, the smith's shop, stables, etc. The well stands before the front-door, walled and hooded with stone; inside is a heavy chain for drawing water, and I remember Rosa von Tannenburg, how the story tells that she went down into the well to save the life of the child of the knight who kept her father a prisoner. That short stone trough beside the well—the horses' drinking trough—is, perhaps, the oldest utensil about the place. Several trees are growing in this court-yard, but all are trimmed in the French fashion, except that shady English walnut, as we call it, which is spared on account of its fruit. Going up the broad stone steps and standing on the high gallery or front porch, what a beautiful view we have on the left of the plain below, of the village with its church steeple, the cream-colored stone houses, with their pretty red roofs, in the green of this wet season! Going out of that great gate through which we entered the yard, at a little distance behind our house is that of the farmer, or granger, as he is called; madame the granger and others come to our well for water. We call him a granger because he rents the farm on shares; if he paid his rent in money, he would be called a renter. I suppose that these expressions are local, however. The farmer's house is a stone cottage, the right end being the stable, where we find three thrifty calves tied. Near the entrance is the decent-looking bed of one of the men, who sleeps here and can thus guard the animals during the night.

The morning after my arrival Madame Lesmontagnes gives me my breakfast, about seven o'clock, at a clean table of heavy cherry-wood. We sit down together—the mother, three sons, and myself—the young men wearing their hats. Madame L. gives me a bowl of hot milk, into which she pours coffee. She has toasted two slices of bread made of dark flour; it is entirely sweet, but they never put salt into it. In one corner of the kitchen where we are sitting is the hanging shelf or rack where the loaves are ranged on their edges. They measure about half a yard across, and one of them weighed more than sixteen pounds, although not fresh. They bake once a fortnight. When they farmed themselves they baked eighteen loaves at once. Madame afterward buys white bread for me from a village baker, the family frequently eating rye. The subject of butter having come up once or twice, I get it during the latter part of my stay to eat on bread. At this breakfast just spoken of madame also gives me a boiled egg, while the family eat their soup of vegetables and a little pork, and then have a little wine, but I did not see madame take it at this time. At dinner she had the table set in the next room, or dining-room. No one sits down to this table but myself and the eldest son, and I begin to be afraid that madame will trouble herself too much on my account. All these rooms show the antiquity of the house, the large one in which I sleep, which communicates through a small entry with the dining-room, being the handsomest. There are also several small rooms on this first floor besides those mentioned. The large bed in one corner of the dining-room is covered with a neat quilt of crimson cotton. Madame had a seamstress to quilt it, who brought her frames. Over the mantel in the dining-room is a collection of engravings, etc. Here is a little crucifix, and an image of Mary with the infant Jesus on her arm, a colored engraving of "Our Lady of the Seven Sorrows," photographs of different members of the family, and certificates of the first communion of several. One of these bears the saying, "He who eats My flesh and drinks My blood remains in Me and I in him; I will raise him up at the last day." Here, too, is something quite new, which began since the fall of the empire. It is a certificate given to Henri, the youngest, stating that he had been judged worthy of receiving the certificate of primary studies, comprising moral and religious instruction, reading, writing, elements of the French language, calculation and the metric system, and the history and geography of France. All these things do not make a great deal of show in the large old dining-room, which is not much furnished, and has a high ceiling and a brick or tile floor.

Pierre kept on his hat at the dinner table, but was very pleasant otherwise.

When the family are speaking together they talk patois, which they also call *jargouin*, but to me they talk quite good French; and as they speak it more slowly than the Parisians, it is easier for me to understand it. I think that I can gather the subject too when they speak patois, probably, however, because pure French words are introduced to help it out. I suppose its forms are not numerous and strict, like those of the written language. At four o'clock in the afternoon of this my first day the two youngest sons, who were at work, come in and want a taste of *goûter*, which is, I believe, bread and a little wine, and madame brings

out a piece of a plain pie or tart. At supper we have vermicelli, which is good; a piece of beef warmed up, also good; and a half of a little cheese made of goats' milk, or a pat of cheese with cream poured over it—very good. You will see hanging up at houses what look like large rustic bird-cages, but which are cages in which cheeses are drying. At supper we also have excellent cherries, which one of the boys has gathered. This year they are about four cents a pound, for the rains have made them scarce, but usually they are about two cents. I also have a bowl of milk, and there is wine on the table. Madame gets me to taste piquette—a drink which is not bad, and one of which I afterward make great use as a substitute for wine. It can be made of various kinds of fruit—of cherries, of huckleberries, or of grapes after the pressing. This that I am drinking is made of dried apples, with, perhaps, a few dried pears. About fifteen or twenty quarts are washed and put into one of their large casks, which hold forty-four gallons. The cask is then filled with water, which will be ready to drink in eight days. It remains sweet for about twelve, and then becomes piquante, or a little sharp. If it grows thick, add water without putting in more fruit. Madame lately added about ten gallons, and the same quantity may be put in again.

I sleep in linen or hemp sheets of madame's own making. This careful mother, I fear, confines herself to low diet. She complains of rheumatic pains in the head, and I wonder whether they can be caused by brick floors. She wears a neat white cap, and beneath the border she has thick black hair. She is a neat housekeeper—more orderly than I should be. I see her eating a slice of bread with a little bit of cheese which is rather old—"un peu passé," she says. I say to Pierre that at her age she might be willing to allow herself a little luxury. He answers that she will not. She does most of her cooking on the hearth, the chimney being much like our ancient ones, but not inclosed at the sides, so that there are no chimney-corners. A strong chain hangs down, to which the pot is hung, and other pots sometimes stand around the small fire.

For my breakfast coffee she makes a little charcoal fire in one of the small grates of a range which has five such. They buy their charcoal. In the winter they live in madame's sleeping-room, which has a little stove. Fuel is a weak point in France. They rise at four, milk the cow and goat, attend to the ducks and to other matters.

I was much impressed, on coming here from Paris, with the candor of the people; I was sincerely glad to get the place, which suited me admirably, and I did get a little looking-glass in my room too.

On Friday, madame asks me whether I will take a meagre dinner, as they are Catholics. I say "Oh yes," and Pierre invites me to the little pond to see him take out carp. The water has been drawn off, and he takes four of these fish from the mud and water in the bottom. Again Pierre and I sit down together in the dining-room, and I am surprised at the excellence of my Friday dinner; for we have, first, a very nice omelet, dressed with a quantity of butter. (She has a pot of butter for cooking—butter which she has carefully melted and skimmed, that it may keep sweet.) Then I have a carp, and Pierre one, sweet and fried in oil. Then I have blueberries from a hill near, and the girl brought a piece of that large pie which had appeared before. There were also cooked prunes, and a plate of mixed cake from the pastry-cook's in the village; and then madame wanted to give me Malaga raisins from a jar of wine, or brandy with sugar and water in. I have laughed with them at my fears in coming here, and have told them that I had written that one thing which the French want is to tell the truth, but that I find them candid. The next morning madame went to market in the village, taking eggs and a couple of ducks: she walked, and is quite warm when she gets back. She waits a while and then takes the inevitable bowl of soup, which has in it some sugar peas and carrot, and bread, probably rye. She moves her lips and crosses herself before eating. She does allow herself one little luxury, her pinch of snuff. I had a mind to call the chapel her great luxury, but since it was repaired and the paintings retouched, I suppose that it does not cost much.

On Sunday morning she walked to early mass at the village church; the warm air, the smell of the vines in bloom, and the sound of the church bells are pleasant to me this morning. Madame lets her servant and little niece go to ten-o'clock mass, and is getting dinner herself with no one to help her. Sunday is a feast-day, so we all five sit down in the dining-room. She gives us, first, a potage of vermicelli, then boiled beef and carrots, then cabbage stewed with one or two little pigeons taken off of the nest, and, fourthly, a chicken, the preposterous woman taking the neck and head for herself! There is also some sweet cake, and some cherries for me, and then they have black coffee, with which they take rum!

One morning at breakfast I told them that it had been said in my country that every step in the dance is a step toward hell.

"And there are people here who say so," one of them replied.

"Who are they?" I ask.

"The curés," says Pierre, by which he means the parish priests—"the curés, the bigots."

"I say so," says Madame L.

"Then," I add, "I may say that it is the curés, the bigots, and Madame Lesmontagnes." At which they laugh.

"Hell is full," says Pierre; "there is a big devil behind the door with a stick, who will not let any one else come in."

"You may say," says she, "that Madame Lesmontagnes and her sons are not of one mind." She tells me once that she likes to read when she has time; that she sometimes reads *The Propagation of the Faith*, a missionary journal.

I find one afternoon that she has been up on the hill-side to get some green broom to make a broom to sweep with. She had, indeed, a very large one made of broom-corn, with which my room is swept; but then that cost twenty sous.

While speaking of dancing, I remarked to them that I had not yet seen the gay grandsire of the English poet, him who,

> "Skilled in gestic lore,
> Has frisked beneath the burden of fourscore."

Whereupon they tell me that one of their villagers married his third wife at eighty, is as deaf as an iron pot, but dances still. "You should see him jump!"

Not long after my arrival I asked madame what would be her charge for my board, and she agreed to take me for twenty-seven francs a week, adding, "You will, perhaps, be willing to give something to my son." This was the eldest, Pierre, who accompanies me on most of my walks. I have already told of his having lost his health in the Prussian war, when he must have been quite young. He thinks that the trade of a soldier is not a bad one when there is no war; it gives men an opportunity to see the world. He says that the French liked the war with Prussia in the beginning, because they thought that they were going to conquer; they went out singing the "Marseillaise" and "Ninety-three," even when going to slaughter at the cannon's mouth. He adds that this war cost France the lives of three hundred thousand men, of whom more were killed by disease than in battle. Since Pierre lost his health he has been a considerable reader, and the farmer's mother calls him learned; but he went to no higher school than that of the village. Although Madame L. has so few luxuries, Pierre has two—the hunting dog, lean and hungry, and his horse. He does not need a buggy, like our Pennsylvania boys, for in this part of France, if in any part, it is not consistent with good manners (or good morals) for young men to invite young women to ride. Pierre is a republican; but before the war I suppose that the family was Bonapartist. He and I are so much together and have so much talk that we can scarcely fail to find out our differences. Thus he would not like to eat bread with salt in, because it is not good. I did not see why he should take half a day to render lard, when I can do it nicely in less time. He does not see why we should keep the bodies of the dead two days, when they only keep them twenty-four hours, except in special cases. He favors a large standing army, and, worse, he argues that our republic will not flourish long, but will decline by civil war.

On private occasions we get upon difficulties more profound, as when he explains to me why they prefer Jews to Protestants. He brings me also a Protestant Testament, and tells me that there are ridiculous things in this version; but I do not learn that he ever saw theirs complete. One of our most remarkable arguments, however, is called out by a statue over the church door in a neighboring village—a statue which, he tells me, represents the Eternal Father—to which, when in private I bring some objection, he replies at length, one argument being—

"You say that you have the liberty of the press, but it seems that you have not the liberty of making images."

"But of God!" I suggest. "Does not the Scripture say that God made man in his image? I find that your idea is superstitious, and I do not like superstitions myself."

Charles, the second son, has also been a soldier, and tells how the women and men work together in field and house in that part of France where he was stationed, near the Pyrenees. The French soldier gets his board and clothing, and one sou a day (not quite a cent). In the artillery and cavalry he gets two sous. He does not consider himself very highly fed on about four-fifths of a pound of meat daily, and about a pound and a half of bread, besides that in his soup. In the country he receives, at five in the morning, a cup of coffee with a little sugar and no milk. At nine he has beef soup, with bread and meat. At four in the winter and five in the summer he again receives soup, meat, and bread. This meal on Thursdays and Sundays is more of a feast, for he has a stew, made, perhaps, of potatoes and mutton. His usual drink is water, but in summer he adds to it some sirup of Calabria —a sort of preparation of chocolate.

Charles Lesmontagnes, however, seems fond of wine, and says that it would not do for him to sign the pledge against it, for he should break it. A friend explains that he does not often drink to excess, but sometimes, when he is with his companions. Being the strongest person in the family, it is he who kneads those large batches of bread.

Henri, my pretty, brave boy of sixteen, is the third son. It was he who received the certificate of primary studies which I have

before described, the primary schools of France corresponding with our grammar schools. When Henri was examined, there were eleven applicants from this village, and only four passed. There was no girl among these applicants; yet one girl passed from an adjoining township, the daughter of the teacher. Pierre says that he can take me to visit that school.

A good deal was said about wine during my stay, as I had told them of some in America who did not drink it. The eldest son declared that it is a happiness for our country that we do not produce it. Although money may be made by it, yet people get drunk, and sometimes that results in madness. He adds that the Frenchman is not boastful or vainglorious unless he has been drinking, but at the same time he urges me to take wine, saying that it does not intoxicate if drunk while eating. On another occasion madame declares it to be a good thing not to drink wine, and says that there are a number of women who get drunk. In the mind of young Henri, however, a difficulty arises as to how they are going to sell wine if every one gives up drinking it. And he maintains that those who do not drink wine have not so much vigor; they may be as strong, but they are not so active. "Oh, madame," he says, "when you drink wine, you are lively and active." He is quite handsome, and looks very well when I see him, as now, without his hat. On the point of strength, I tell him that I should like to have him tried with some of our harvest hands at home, who do not drink intoxicating liquors.

There are two other members in Madame L.'s family—Toinette, the servant-girl, and little Jeannette, the daughter of a deceased relative. Toinette calls herself a *bonne*. Our New England people have been ridiculed for calling their servants "help," but is it not quite as ludicrous to call a female servant a "good one?" Often, however, the French say, a "domestic." Toinette looks healthy and strong, but I do not perceive that she feasts much. Our hired women at home would expect more. She comes in to dust my room wearing short black woolen socks inside of her wooden shoes. She calls the socks *bottines*, and tells me that in cold weather they wear woolen stockings too. All the family wear wooden shoes at home. Toinette's and some others are cut low, and supplied with a broad leather strap over the instep that helps to keep them on. These straps cost ten sous, and will last for several pairs, the shoes themselves costing eleven sous. Toinette's shoes last her three weeks, but Madame L. tells me that she can wear a pair about three months. Toinette was hired at Christmas for the year. She is sixteen, and does not get the highest wages. Madame tells me that a good girl can get one hundred and fifty francs a year, but she pays Toinette one hundred and ten, or about twenty-one dollars.

During my stay occurs the village festival, or the fête of St. Peter, our patron saint. It had been held on the previous Sunday and Monday, and we keep it up on this Sunday too. Toinette wants to go a while in the evening, but she tells me that it is not so beautiful as it was last year, for some of the young men have gone to the war, and some of the others said that they would not go to the festival. She thinks that she will not dance, because her father has died, and I see that she wears black. When Sunday evening comes madame does not want her to go, but she says that she wants to get a share in the lottery, and escapes. Henri, our youngest boy, gets home about half past ten, and Toinette about one o'clock, with a party coming here—Charles and the farmer or his brother, and the farmer's domestic and her brother. Then Toinette is indulged a little, being permitted to lie until five in the morning.

Little Jeannette, the boys' cousin, is much younger. She has been staying at home on account of the hay-making, but now begins again to go to the village school—I suppose I may call it the public school. It is kept by "Sisters of St. Joseph." She is a quiet little girl, and can help to tend the grazing animals, to tramp hay in the barn, and to do other things. It is not kept a secret that her father was intemperate, and ruined his health by drinking, although he did not spend his possessions.

I have before alluded to the farmer who cultivates most of the farm, and who lives in a large stone cottage behind our house. He is a bachelor, and his family consists of his mother and brother, his uncle, and a domestic. The uncle is a "good boy," who has always lived with them. You can marry your brother-in-law in France, but you must have a dispensation and pay money, as Madame L. frankly tells me. She speaks highly of the family of the farmer on account of their business habits, but tells me that they are quite ignorant, having come from a mountainous district. The farmer's brother has to go for a soldier, but he drew a favorable number, and has only to stay one year. His mother tells me that at this time a first-rate hired man must be paid four hundred francs a year. I learn, however, that the farmer can put by something every year, and that he can lend it in the neighborhood at five per cent., government securities paying four and a half. He rents about eighty acres from the Lesmontagnes. His mother is sixty-six. She is one of some ten "good old women" who wear wooden shoes to church. She can not believe that I have come from America so far. "And is that a part of France?" she wants to know.

I think she can neither read nor write, and her sons can not write, nor their uncle. Once, when Madame L.'s sons are away, I ask what officers they have the right to vote for. She can not answer, and I propose to inquire at the farmer's.

"No," madame says; "they are ignorant. When voting time comes my sons have to tell them which are the republicans." She shrugs her shoulders and adds: "It is not possible to get information there." But she tells me afterward how they worked one night—the night of the fête of which I have spoken—a night when it rained. They had left three loads of hay out in the field, and they hurried and hitched up oxen and cows, and got one load in, but found the rain come on so that they could not get in the rest; so they took out straw to cover it, and were up all night, said madame. They have four working oxen, but it is not uncommon here to see cows drawing loads for small cultivators.

While I was on the farm the farmer's family were baking one day in Madame L.'s great oven; the farmer or his brother kneaded the dough and the uncle heated the oven. The farmer gets some of his wood from the trimmings of the trees of the Lesmontagnes, besides, he has bought a bit of ground on the hill with oak saplings on it, and he has permission to cut broom or *genêts*, which suffice to heat the oven, to kindle the fire, and cook potatoes, which, after being mashed, are fed to the hogs. For a while the farmer was very busy, and had extra hands. One young hired man was in Madame L.'s yard naked from the waist upward, which looked very strange to me when the young hired women were about. I asked whether he was going to take a bath. No, it was on account of the heat; but if they had such suns as ours, would he not want a shirt to protect his skin? They do not go barefoot, however. When I spoke of it, madame thought it would not be wholesome for Toinette on the tile floor, and Pierre thought it would not seem very nice. How Jeannette's wooden shoes clatter on the stone steps and tile floor when she hastens!

On Sunday the farmer's mother comes into the yard and wants me to sit down with Madame L. and herself for a little gossip. She wants me to wear a cap. She says that I am thin, and I reprove her for not being complimentary. She offers me a pinch of snuff, and again wants to know whether America is a part of France. She does not work in the garden, like our "Pennsylvania Dutch" women, but hers are working hands. One day her son is very busy cutting a large field of rye, and they have eleven extra men. I see none of our great reaping and mowing machines here. Madame the farmer has a great deal to do this day. Her domestic is in the field in the morning guarding the oxen, cows, and calves that are grazing. While she is thus acting as shepherdess she sews, knits, or spins for the family. To see her going out with a distaff of hemp was quite novel to me. At eleven o'clock she comes in to help madame the granger with the dinner. Madame will give the men vegetable soup, or occasionally rice soup with milk in it. After the soup there will be omelets—I am told that it will take three or four for so many men—and there will be bread and cheese, salad and wine. The cheese is made from milk after the cream is taken off, or from goats' milk, pure. The salad is dressed with vinegar, walnut oil, salt, pepper, and a little garlic. Madame L. tells me that they are not ill fed. At noon the domestic milks the cows and the goat, for she does it three times a day. At three she will go to the fields again with the animals. This care must be used, as there are no fences. At four o'clock the men will have a lunch in the field; some one will come and help the mother take it out. They will have bread, cheese, and salad.

"And wine?" I ask.

"That is a matter of course. They drink wine at the four meals; but if they are thirsty between, they take piquette. They do not drink water; they don't like it," says Madame L.

Harvest hands get meat once a day—at breakfast there is a bit of bacon in the soup, except on Friday—say something more than a pound for so many men. Then there are bread and cheese at breakfast. The supper is at eight, and is soup, bread, and cheese again. (Madame L.'s cheeses resemble "Dutch cheeses," or little pats, made in Pennsylvania from smearcase, or cottage cheese.) After harvest is finished they will have the revel (*rivolle*). This is a supper where madame the farmer will have a ham or shoulder boiled—for they call shoulders hams. Then they will have some other meat; if there are so many men, perhaps there will be a couple of rabbits—rabbits stewed with wine; and there will be, moreover, bread and salad and wine at the *rivolle*.

The farm is planted in the following manner: in vines, about ten acres; in meadow there are twenty; in rye, twenty; in wheat, five; in potatoes, five; in oats, two and a half. Maize or Indian corn is also sown, but only to be fed green to cattle. It is cut at the height of about two and a half feet, when quite tender, and is given to the animals in their stables. Grass seeds are never sown in this district; but when a field has been cultivated and the harvest gathered, whether of wheat, oats, or any thing else, then they do not fatigue the ground, even in the plain, the second year, but allow the natural grasses to grow, and there animals graze,

under the care of a shepherd or shepherdess, and generally of a shepherd's dog. Pierre values their shepherd dog at one hundred francs; but his mother tells me that he is worth about half that sum; that her son puts that value on him because he loves him; he was worth it once, but now he is getting old. The shepherd dog is only taxed one franc a year, the others five.

I have spoken of there being twenty acres in meadow on the Lesmontagnes farm, and Pierre tells me that meadows in France are never tilled. They endeavor to water them, and if there is no stream, they try to find a spring, where they will make a deep hole or pond, and thence conduct the waters by means of little ditches or canals. You can see meadows on the sides of the hills crossed lengthwise by these ditches. These meadows are rarely manured, the manure being wanted for the vines, which pay better. One-third of the manure is put upon the wheat, and two-thirds on the vines. Generally by the beginning of June the water ceases to flow through the meadow ditches. There are usually two cuttings of grass taken from the meadows, one in June and July, the other in September and October; but if not well enough grown, it can be pastured. I have said that these meadows are never tilled. Pierre thinks that theirs has not been ploughed for three hundred years, and conjectures that some in France have not been broken up for a thousand.

Vineyards I see laid out in wide lands made to heave up in the centre, to shed the water. They are so happy here as not yet to have suffered from that destructive insect the phylloxera. A plantation of vines in the plain, I am told, will last one hundred years, but here on the hills only about twenty-five. At the age of three years the vines must be staked, the stakes being generally taken up at the end of autumn, and, if good enough, sharpened and set out in the spring. The vines are cut down to about a foot in height, and are manured once in two or three years, the younger vines being preferred, which give more fruit. I saw a little girl one evening with basket and shovel taking up manure from the road, which was supposed to be for the vines. The vines on the hills are supposed to be as profitable as those on the plains, but not so the grass and grain. At the age of seven years the vine is strong enough to sustain itself; but before the vines clasp around each other in the summer they must be tied. All the branches belonging to one vine are tied together with wisps of straw. This is considered to be women's work, and, with haymaking, is, I believe, the only farm-work that women do in this part of France.

The vines must be worked four times a year. The produce of wine here is about three hundred and fifty-two gallons to the acre, as I am told; worth, when newly fermented, about twenty-five sous a gallon, by the cask. This would come to four hundred and forty-two francs the acre. The expense of cultivation and vintage is eighty francs. If this estimate be correct, an acre in bearing vines would pay seventy-two dollars a year. When the grapes are gathered they are put into vats, some of these being very large. In a few days they will have fermented, and then several naked men will jump into a vat to tread them. This method is probably very ancient, as we read: "I have trodden the wine-press alone, and of the people there was none to help Me." I am told that there is never a season that men are not asphyxiated or suffocated by the fumes of the wine when they are treading the grapes, especially when the vats are not full. After the grapes are trodden, the wine still remains in the vat for twenty-four hours, when it is drawn off, and the grapes are pressed. Four or five men work the great press of the Lesmontagnes; then some of the pressed grapes are taken to make piquette, the farmer's family making several casks. Then the distiller comes, and from the remainder of the pressed grapes distills brandy, white like water. Generally the wine is sold as soon as possible, because it evaporates in the casks; but all that is left over must be changed in the spring, or the lees in the bottom will ferment, and spoil the wine. At supper on the day that the grapes are pressed there is another *rivolle*. There is another ham, but as fewer men are needed, one rabbit may suffice. Then there is always a good leg of mutton when the wine is drawn—a leg of mutton with potatoes around it. And sometimes the women make a *brioche*, or large unsweetened cake, and a pie.

I have said that women do not work the gardens here. These well-to-do farmers have neither tomatoes, cucumbers, nor melons; it is said that to have them would cost the labor of another man; and I see that a large part of the garden is in vines. I hear that cucumbers and tomatoes will grow here without glass, but not melons.

Having now given a little account of farm labors, I will endeavor, before closing, to tell of some of my walks and talks with Pierre. Our first walk is to the village, about a mile distant. Pierre has put on his neat dark blue linen blouse and his leather shoes. Going through the lanes, the short way, we see many orange-colored snails, and a few of those with shells, called *escargots*—those that the French eat. In the spring you can gather a basketful along the lanes, beneath the vineyards and among the vines, and under the cabbages; they love the cabbage much. But now it is July, and I save two. Growing along the stone walls that support the vineyards we find various wild flowers,

and wild currants, small and nearly sweet, wild gooseberries and plums, and brier bushes resembling blackberries, but some of the blossoms are pink. The people do not appear to prize the fruit. Toinette afterward tells me that some gather them for the chickens. She does not like to eat them; they are so sweet they give her pain in the heart, which I understand to be French for what Americans call pain in the stomach.

Pierre and I pass the village church, and he expresses the opinion that it is about three hundred and fifty years old. "The curé talks about it, and says that we ought to have a new one; but they don't listen to him; the expense is too great."

"But does not the government pay?"

"Only one-third; the commune has to pay the rest."

The commune is the township.

We hear music in one of the village restaurants. It is a wedding, and we step in and look on a while, Pierre taking a turn in the dance. On this walk I notice the full bloom on the chestnut-trees. Chestnuts and walnuts are planted out in the fields, but not until they are too large for the cattle to hurt them. Walnuts (English) are worth about thirty cents the half bushel, and large assorted chestnuts about seventy cents. One of my friends here says that she does not like chestnut-time, for then the fine days are coming to a close. After we get home madame is good enough to fry the snails for me. They are not so good as fried oysters; these are tough: suppose I have them stewed next time.

A neighboring hill is the object of our next walk—a hill whence we can see a number of villages, and the large town of R—— in the valley of the Loire. We come to a belt of small pines where the ground is never cultivated, and we see quantities of ferns mingled with the purple fox-glove which grows wild and fine. Before climbing the hill we met a little party who had come out from the village to "taste the country."

Having climbed to some height, we hear singing, and Pierre says that it is a shepherdess, whom we find near the top, where she is tending several cows and calves and a couple of goats. She has her knitting, and I am surprised to see how tidy she is. I can not persuade her to sing for me, but she joins us, and they pick low huckleberries, and kindly supply me with some. They are very low, and less sweet than ours. We get to talking about the dancing on Sunday, and they agree that it would be no use for their curé to talk to them about not dancing on Sunday, for they would not mind him. They incline to think that the Catholic is the least severe religion. When we get home, supper is ready, and I find myself very happy among these people.

Another day we follow the course of a pretty little river which comes tumbling down its rocky bed to join the great river. I suggest to Pierre that the rivers of France are unsung, and he does not give me an instance to the contrary. We meet on the road a government agent, whose business it is to superintend the construction of a new road; but he is going away because the workmen are "making the wedding" this Monday afternoon—that is, they are drinking wine.

Pierre tells me that almost all the men who work by hand in France, although paid on Saturday, work until Sunday noon. They are at liberty to stop before, but very few do. On Sunday afternoon they begin to drink, and keep it up until Monday evening. This is called, in jest, keeping Holy Monday. But on this same walk we found other persons who were not keeping Holy Monday.

Another day Pierre accompanies me to the village schools. The public are not allowed to visit the public schools of France, but we obtain admission here. The boys' school is supported by the commune, which pays four "Little Brothers of Mary," or Marist monks, about five hundred dollars a year to keep it. It is open ten months, and the Little Brothers are not like to indulge to excess in eating and drinking. However, they have the use of the house as a residence, lodging, I suppose, in the third story. Entering the yard, we see through a basement window the Little Brother who "makes the kitchen," or cooks for the four. On the next floor we find the principal, and Pierre tells him respectfully about this being an American lady, and, after some parley, we are allowed to enter. The Brother wears a greasy skull-cap, a long robe of black cloth, by no means new, and an image on a string around his neck. He is not a little brother in person; he is rather jolly-looking, with a round, reddish face, and he smells of snuff. He does not invite us to sit down—I see that there are not enough chairs. He hears that I am a Philadelphian, and turns to the map of the world, but seems to have a difficulty in locating me, and I point it out. He asks the boys what ocean lies between, and they answer. I remark that I see intelligent eyes here, and I understand him to answer thus: "Why not? They are French." Pierre tells me afterward that the Brother did not understand what I said about my native city, for he is well taught. I am not shown any further exercises, nor asked to put any questions; and then we go into the next room, where there is another Brother, with another worn robe and another image. He is younger, and more shamefaced at receiving me. Am I the first woman to visit their school? There is the same want of chairs; and we go down to the third class, in the basement, presiding Brother telling us by

the way how crowded they are in the winter, when they have one hundred and eighty pupils. In this lowest class we find a young Brother more shamefaced than the other. The head teacher has a little fellow to read to me, and he brings out painfully something about Solomon's Temple in a story-book from the Holy Bible. Another, however, reads more glibly from the same on a subject of equal interest. Then we go out into the yard, the head Brother asking whether I am acquainted with bees, and showing us his nice rows of straw hives; also their little bit of well-cultivated garden ground. Poor Little Brothers, who have taken the three vows! Pierre tells me that a curé gave eight thousand francs to build this school, on condition that it was taught by these Brothers.

We walk on but a little way when we come to the house where the Sisters of St. Joseph keep the girls' school. Pierre obtains admission for me, but goes himself to a restaurant. For the highest class the Sisters get five francs a month for each pupil; in the second, three francs; in the third, two; and in the fourth, only one. In this last they are obliged to take the poor for nothing. In the highest class I am shown embroidery and other sewing. They sew three hours a day, and it is probable that they spend at least one hour daily in moral and religious instruction, as at Paris. I am invited to put questions, and I ask what are three-fourths of sixteen. One pupil suggests five; another, perhaps seven; but after a little questioning they give the right answer. I tell them whence I came, and ask what ocean I crossed. Silence. Then a delicate voice says, "Arctic Ocean." I turn to a map of the world which hangs in a corner. Another says, "Pacific." I tell them that I could come by the Pacific and Indian oceans; and the answer rests.

Madame Lesmontagnes was kind enough to give me a description of the wedding of her daughter. When a young man here wishes to become acquainted with a young woman, he mentions it to some friend of the family, who applies to the parents for leave to introduce him. If this is granted, and the parents afterward conclude that he is not suitable, they tell him not to come any more. When a young man comes to demand a young lady in marriage, the parents first interest themselves in the family, whether it is a respectable one, and in the young man himself, whether he is *sage*, or well-behaved. The young people are never left together without one of the parents being present, even when there is a talk of their being married.

At last the parents of the two young people will meet to plan the marriage, this parlement being held at the house of the young woman, where, after having had a good dinner, after having drunk well, and talked upon a quantity of other subjects, the rest of the family will leave the parents together, understanding very well what business is in hand. Then the young man's father will speak in this manner: "We have not come here to do nothing; we have come to speak of the marriage of our children," adding, if he is a rich enough land-holder, "I give twenty-five thousand francs to my son; how much can you give your daughter?" If her parents do not give about as much, the marriage agreement will not be made, and the parties will separate. However, about one time in ten it will be found that the young people are too much attached to each other for the parents to continue their prohibition, and they are allowed to marry. And sometimes it will happen, when the young people are of age, and the parents entirely refuse their consent, that the former will make to them the three respectful summons, and then they can marry without the parents' consent. Such a case will happen in this commune perhaps once in three or four years.

Madame L. gave her daughter, on her own part, and from the father's estate, a vineyard of the value of eighteen thousand francs, and she is to receive more. The young man's parents gave to him a piece of land worth twenty thousand francs, and the young pair occupy two rooms in his parents' home, where they can keep house, if they should prefer it. Madame L. added that the young man's mother gave him a furnished bed, and of sheets, table-cloths, towels, and napkins, each a dozen; also three dozen shirts of hemp and flax. "I gave my daughter," she added, "two dozen sheets, two dozen table-cloths, two dozen napkins, and two and a half dozen towels; with a furnished bed, a cupboard, *armoire*, and a night table. The young man's parents gave him a large bureau, and he bought the rest of the furniture. The young people are well set out, well matched, and both are industrious. He is, besides, a merchant of sabots, buying these shoes from the makers; and as he has wood of his own, he employs people to make them; and twice a week he goes to —— to sell them."

The only legal marriage in France is that at the mayor's office, and there is a mayor in every commune. Madame L. tells me that this marriage does not cost any thing, but at the mass the curé marries them, and puts the ring over the first joint of the bride's finger. For this marriage he receives twelve francs. (All the religious and all the fashionable world have this second marriage. Free-thinkers in Paris—I met none in the country—make a merit of opposing it.)

Madame L. tells me that there were about eighty guests at her daughter's wedding, and

all these go to the mass, coming to dine at the house at noon. She herself did not see the ceremony; she heated the oven while the others were gone, "for somebody must take care of things." There were three women, however, to do the kitchen work, and three to wait upon the table.

"And what did you have for dinner?"

"I can not tell you—all sorts of good things—perhaps twenty courses."

"Did you invite the curé?"

"Some do; we did not. We had ham, and beef bouilli—we took forty pounds of beef—we had calf's head, stewed chickens, ducks with turnips, roast leg of mutton, chickens with rice; we had eight ducks, eight turkeys, four geese; and Pierre and one of his comrades, who was invited to the wedding, went hunting the day before, and I suppose altogether we plucked a hundred birds. We had a course of little birds—fig-peckers, sparrows, larks; and we had three pies (*vol-au-vent*) made from the livers of the poultry and the little birds. We had food enough for a week after, besides giving to the relations. The pastry-cook of the village prepared a complete dessert, and we made pies. They give splendid entertainments here at weddings. There was a *pièce* of wine drunk [about forty-four gallons]. We also had Champagne and Bordeaux, but there was not much used, and we had other liquors, but nobody got drunk. That is all, madame, I believe. There are people who don't make weddings, on account of the expense; perhaps only one-fourth make weddings."

This great amount of food was necessary, on account of the guests staying to three meals.

The two musicians were paid by the young men guests. Dancing was kept up until about three in the morning, when the party sought a little rest wherever they could get it; some going to the barn; the little children and the hired women went to bed; and Madame L. got two hours' rest. She added: "On Wednesday we had the breakfast, and then all went away about ten."

A Parisian gentleman desired me to visit also the north of France, where he said that farming is different. My visit to the north may form the subject for another article.

Editor's Easy Chair.

LAST May we quoted from the *Magazine of American History* a pleasant allusion to Franklin Square and the building in which the Easy Chair has long been planted. The editor of that magazine mentioned that the square was named in honor of Benjamin Franklin. But a correspondent of the *World* insisted that the name was given in honor of Walter Franklin, a noted merchant of the earlier day, who lived for many years on the square, at the corner of Pearl and Cherry streets. A correspondent of the *Magazine of American History* asked an explanation of the editor, and he responds by publishing from another correspondent the following resolution of the Board of Aldermen, passed on the 17th of March, 1817, which removes all doubt:

"*Resolved*, That the square now called St. George's Square, at the intersection of Cherry Street, be hereafter named and called Franklin Square, as a Testimony of the high respect entertained by this Board for the Literary and Philosophical Character of the late Dr. Benjamin Franklin."

It was about half a century later that in the same city it was proposed to honor the illustrious services of William M. Tweed by erecting a statue to perpetuate his memory. The names of the subscribers compose an edifying list, but let sterner censors than the Easy Chair print it. The two facts are significant, and they both belong to the minor civic traditions which are full of interest, but of which there is little record in New York. The romance of the city has been much neglected, and is to be found in occasional discourses and desultory sketches which come to light only by chance. Something survives in Valentine's *Manuals*, and Miss Booth's and Mr. Stone's histories of the city; and Mrs. Lamb in her larger work will doubtless gather and preserve much of the floating tradition and reminiscence of old New York. Chief Justice Daly, in a memorial discourse upon a familiar New York figure, the late General Charles W. Sandford, delivered before the Historical Society, gives some very pleasant sketches of the New York of forty and fifty years ago, of days and men and militia which Halleck sang in his lively verse. The militia of that time was exceedingly independent, and the Judge says that in his boyhood it was not unusual to see privates who could not or would not bring a musket attending the parade with a cane, and sometimes the handle of a broom, for attendance, at least, was compulsory.

When the Erie Canal was opened, General Sandford foresaw the destiny of the city, and that the marshy region about Canal Street would be reclaimed for building. Lispenard meadows—the name still surviving in the street—stretched, a great swamp, from what is now Worth Street to Spring Street. A canal drained the waters of the Collect, a pond on the low land east of Broadway and north of Worth Street, to the Hudson, and when the Collect was filled up and the Lispenard meadows drained, the bed of the canal was made the present Canal Street. General Sandford built the first store upon Canal Street, and put up blocks, and chiefly the Lafayette Amphitheatre or Circus, in Laurens Street. Subsequently he was one of the real-estate pioneers in a very attractive quarter, a street running from Broadway to the Bowery, and called, from a fashionable London thoroughfare, Bond Street. That the fancy for decorating our cities with such

names is still as fresh as ever is shown in the names of new streets in Boston—Berkeley and the rest—and of hotels in New York—the Buckingham, the Brunswick, the Windsor, the Albemarle, which have an invincibly second-hand sound.

The Easy Chair was recently looking at the old volumes of the *Talisman*, an annual miscellany which was published in New York in the years 1827, 1828, and 1829, and which is interesting as almost the exclusive production of Bryant, Gulian C. Verplanck, and Robert C. Sands. Verplanck was apparently the editor, and wrote the prefaces, which were signed, with a fine scorn of anonymity, with the name of Francis Herbert, whose sketches and poems the miscellanies were assumed to be. Sands was one of the most fertile of the writers. When he died, in 1832, Verplanck edited two large volumes of his works, and Bryant praised him and them warmly. But they are gone down the stream now, and the name of an accomplished and diligent man of letters is scarcely known to the generation which personally knew and honored his two associates.

Two of the pleasantest papers in the *Talisman* are "Some Reminiscences of New York," in which the writer, playfully exaggerating its metropolitan character, says: "A learned and untravelled medical friend of mine who has dwelt in New York for fifty years, during a considerable part of which I was wandering in various countries, has anticipated me in seeing every thing I went abroad to see except Mrs. Siddons, Madame Catalani, Mount Etna, and St. Peter's." His father, he says, used to show him when he was a boy, which was at the beginning of the century, the spot on the North River just above the Barclay Street Ferry where Jonathan Edwards, when temporary pastor of the Wall Street Church, used to pace the solitary pebbly shore—a fact which adds a new and striking figure to the old associations of the city. But with singular inaccuracy the writer, who was evidently a born New Yorker, says that as Edwards walked there "fell upon his ear the murmurs of that ocean which is the symbol of eternity and power." But even Jonathan Edwards could hardly have heard upon the shores of the Hudson the roar of the ocean. There was a little church back of the John Street Methodist Chapel where Whitefield preached. General Oglethorpe, on his philanthropic way to Georgia, lived in Stone Street; and General Wolfe for a time had his head-quarters at the corner of Broadway, looking upon the Battery. The pleasant gossip describes the inauguration of Washington at the old City Hall in Wall Street, where the Treasury building now stands, "commanding a view of the wide and winding avenue of Broad Street;" and adds—with a strong side light upon the origin of the name of our square, even if the resolution of the Aldermen had not been discovered, for the bank was probably named from Dr. Franklin—that after his inauguration Washington held an afternoon levee, but "I forget whether it was held at the fine old house at the head of Pearl Street, occupied by the late Franklin Bank, or the other spacious mansion in Broadway, now Bunker's Hotel."

The writer celebrates a host of famous people who lived for a longer or shorter time in New York, and some wholly domestic heroes, like the Hewletts, dancing masters for four generations, and contemporaries of the successive Vestrises, the first Vestris having taught the first Hewlett. They taught dancing to the belles who captivated the members of the First Congress, and "tried to teach some of the members," Roger Sherman, perhaps, or Fisher Ames, or Benson, or Boudinot, or James Madison, Jun. But the French Revolution threw new men, new dancing masters, new manners, and new steps upon our shores, and the dapper legs and silken hose of the last of the Hewletts pirouetted and pigeon-winged out of fashion and history. The Duke of Clarence skated on the Collect Pond, where the old arsenal in Franklin Street stands, and his Royal Highness fell into a hole. The future William the Fourth preferred our oysters also to "the copper-flavored productions of the British Channel."

There are graphic sketches of some of the *émigrés*, and among them of Pierre de Landais, who fought under Paul Jones, and who died after a long life of genteel poverty. His income was one hundred and five dollars, which, as he said, gave him just two dollars a week for his living, and an odd dollar for charity at the end of the year. His head-stone stood in the church-yard of St. Patrick's Cathedral, and his French epitaph stated that he disappeared in June, 1818, aged eighty-seven years. But no personal reminiscences were richer than those of a fine mansion at the corner of Charlton and Varick streets, built in the middle of the last century by "a gallant British officer," where John Adams lived as Vice-President during the time that Congress sat in New York, and where Aaron Burr during the whole of his Vice-Presidency kept up an elegant hospitality. It was in this house, doubtless, that Burr gave a breakfast to Volney, which Burr's nephew, the late Judge Edwards, described to the Easy Chair as the most brilliant and delightful repast in his memory. Here at an earlier day Lord Amherst had sat at dinner; and Sands, if he be the writer, describes a later dinner given by Vice-President Adams, who sat in the centre of the table "in full dress, with his bag and *solitaire*, his hair frizzed out each side of his face as you see it in Stuart's older pictures of him." Baron Steuben was at his right; Mr. Jefferson, fresh from France, in red waistcoat and breeches, at his left. Mrs. Adams sat opposite, with the Count du Moustiers, the French minister, in red-heeled shoes and ear-rings, on one side, and the learned and formal Dutch envoy, Van Birkel, on the other. There, too, sat Chancellor Livingston, so deaf that it was hard to talk with him, but so full of wit and eloquence and information that his deafness was forgotten.
